INDEX TO VOLUME 117

MINING AND SCIENTIFIC PRESS

July to December, 1918

Page

Abangarez Gold Fields of Costa Rica, company report.. 396
Abrams, D. A...Basic principle of concrete mixers.... 23
Accidents from insufficient lighting..... 360
Accounting, new book on..... 101
Acetate of lead in cyanidation..... 380
Acetic acid prices in July..... 111
Acid for leaching Utah copper ore..... 789
Adsorption in flotation 730
Advertising and circulation of papers 744
In technical societies bulletins..... 242
Agitation in Parral tanks..... 695
Air compressors, lubrication of 290
In flotation, Callow's work with..... 155
In precipitation of gold from solutions, effect of... 251
Tanks, function of 754
Use of cold in quicksilver condensers..... 322
Ajo, blasting methods at.....S. U. Champe.... 46
Excavating leached ore 303
Alabama, nitrate production at Muscle Shoals..... 454
Alaska, conditions in, new map..... 765
Lake Clark-Kuskokwim region..... 129
Mining in.....E. J. White.... 711
Railroad progress 429
Alaska Gold Mines .....Editorial.... 305
Shares .....Editorial.... 71
Company report 328, 805
Alaska Juneau Gold Mining Co., report on..... 833
Alaska Treadwell, Alaska Mexican, and Alaska United mines, report on 833
Group, power plants 822
Alaska United, depth of Ready Bullion mine..... 165
Alienization .....Henry Legin.... 619
Allen, G. R.....War Minerals Bill.... 373
Alloys of manganese 56
Alumina from compounds of metals..... 312
Aluminum alloys, analysis of..... 602
Dust v. zinc-dust for cyanide work..... 91
In Germany 22
Ditto ..... Editorial.... 1
In Zeppelins 194
Strength of 192
Alundum manufacture 45
Alunite and potash 761
In Europe 560
Locating metalliferous lodes containing..... 110
Treatment for potash 160
Amalgamated Zinc (De Bavay's), Ltd., company report 399, 878
Amalgamation of gold from coarse ore..... 290
American Bankers Association and gold.....438, 461
American Gold Conference....Courtenay De Kalb.... 243
Ditto ..... Editorial.... 241
American Institute of Mining Engineers and Mining and Metallurgical Society to merge..... 816
Bulletins, matter therein.....Editorial.... 241
Meeting in Colorado 369, 392
Name ..... Editorial.... 105
American Mining Congress circular on chrome and manganese 782
Journal and Mining and Scientific Press..... Editorial.... 743
American mining engineers and war..... 439
Potash resources 759
American Smelting & Refining Co. and payment to ore producers ..... Editorial.... 205
Smelter at Garfield..... 853
American Trona Corporation potash output in 1915 699
American Zinc Institute meeting at St. Louis..... 163

Page

Ammonia in flotation, use of..... 533
Oxidized to nitric acid..... 424
Amparo Mining Co., company report..... 65
Anaconda Copper Mining Co.'s expanding interests.... Editorial.... 814
Starts making ferro-manganese 431
Stops making ferro-manganese 837
Analyses, chemical .....Herbert Lang.... 747
Of nitrate samples from Oregon..... 286
Analysis and sampling of chromite...A. A. Hanks.... 654
Of Calumet & Arizona blast-furnace products..... 184
Of Calumet & Arizona roasting-furnace materials.. 184
Of crude and calcined magnesite..... 460
Of flotation concentrate at Utah Copper mills..... 752
Of iron ore in Santo Domingo..... 358
Of molybdenum ores 313
Of quicksilver fume 316
Of reverberatory products at Calumet & Arizona.. 186
Of 29 American magnesite samples 324
Of zinc-lead ore 193
Anchorage, Alaska, letter.....93, 668
'Annalist', views on gold..... 279
Anticlines and apexes.....R. M. Searls.... 43
Antimonial-lead pipe in flotation plants..... 376
Antimony and quicksilver in Idaho..... 500
Di-oxide, preparation of 534
Imports and stocks in December..... 839
In 1916 32
Market demoralized 674
Ores, Magnolia Metal Co. to buy..... 706
Sulphide, use of 420
Apexes and anticlines.....R. M. Searls.... 43
Apex suit at Rochester, Nevada..... 573
Suits at Bingham, further..... 201
Suits at Jerome impossible..... 195
Apparatus for sampling quicksilver fume..... 317
For sulphur di-oxide tests..... 417
Argonaut mine, California, hoisting at..... 57
Arizona Copper Co., company report..... 500
Arizona copper production in 1918, estimate..... 805
Cunningham Pass district 19
Geologic survey to be made..... 667
Manganese in 393
Manganese in western 755
Mines, assessed valuation 606
Mining situation at mid-year 229
Valuation of mines 165
Arkansas manganese deposits..... 464
Arsenic in subterranean waters..... 160
Arthur and Magna mills, Utah..... 714
Photo of 721
Artifice for restoring economic equilibrium of world... 798
Asbestos, chromite, graphite, magnesite, mica, and molybdenite in Quebec 625
Production of U. S. in 1917..... 118
Asphalt production of U. S. in 1917..... 118
Assaying on the Rand..... 24
Assay at Joplin, Missouri, purchaser to pay for umpire. 837
Cost in Korea 753
Of zinc-lead ore, standard method..... W. G. Waring.... 193
Plan of Utah Copper tunnels..... 478
Assaying on the Rand 24
Atlin, B. C., magnesite at..... 502
Placer mining at 573
Aurora Consolidated Mines Co., company report..... 103
Austin, Texas, letter 228
Australia, development of flotation in 375, 404

Page

Australia, labor unrest in 458
Metals, output sold in 226
Use of lead salts in cyanidation 380
Automatic separation of solution from solids in ore-pulp .....B. MacDonald.... 695

B

Ball mill controversy in technical press..Editorial.... 471
Mills in the Oklahoma field 131
Test, Brinell 244
Balzari, R. A..Hoisting by stages from deep mines.... 57
Banker and depositor, talk on prices 455
Bankers endorse gold propaganda.....Editorial.... 438
Meet at Portland, Oregan, to discuss gold.....341, 362
Barium carbonate prices in England 56
From strontium, separating .....J. Waddell.... 495
Mining in Nevada 330
Barker, E. E....Tunnel-blasting at Chuquicamata.... 213
Barnes-King Development Co., company report...296, 734
Barrett, E. P.....Rapid method for determining titanium and chromium in beach-sand..... 729
Barytes prices in June 56
Basic principle of concrete mixes....D. A. Abrams.... 23
Bates, B. R.....Flotation and other troubles in.... 277
Batesville manganese district, Arkansas 464
Battle of St. Mihiel offensive 823
Bauxite in India 312
Production of U. S. in 1917 50
Bawdwin mines ore, milling 800
Beach-sand, rapid method for determining titanium and chromium in.....E. P. Barrett.... 729
Beer-Sondheimer and Minerals Separation—A chronology 189
Belgium ..... Editorial.... 548
Feeding 381
Bell, R. N., ventilation of Butte and Idaho mines..... 430
Belmont Wagner Mining Co., company report..... 28
Belt conveyor, notes on 349
Conveyor, portable 675
Wear of 290
Benedict, W. deL.....Gold problem....650, 817
Ditto.....Market-value of gold....209, 275
Ditto.....What is a dollar?.... 145
Benguet Consolidated Mining Co., company report.... 574
Bingham & Garfield ore-train.....445, 479
Bingham canyon, ore-train, and Utah Copper mine, photo of 479
Bingham, Utah, apex litigation at 64
Discovery of minerals 446
Porphyry ore, J. M. Callow's experience..... 154
Bismuth in surgical dressings 58
Black sand treatment 681
Blakemore, L. G....Why not domestic ores first?.... 711
Blaster's handbook 336
Blast-furnace and potash 760
Gas, potash and 559
Of Calumet & Arizona 181
Blasting at Chuquicamata, tunnel...E. E. Barker.... 213
At Utah Copper mine 523
Fitting primer for 580
Methods at Ajo.....S. U. Champe.... 46
Powder, making black.....W. J. Cahalan.... 675
Well-drill.....J. C. Costello.... 685
Block-hole blasting 47
Blowers at Calumet & Arizona smelter 182
Blowpipe analysis, new book 740
Boilers, efficient burning of coal under 336
Bonus on gold production, result of 209
Plan, new.....A. M. Heckman.... 249
Bookkeeping, new book on 301
Boston & Montana Development Co., company report.. 63
Boston Creek, Ontario, map of 537
Boulder Tungsten Production Co. affairs 733
Boundaries: racial and natural.....Editorial.... 847
Bounty on gold, how to pay 861
Boutwell, J. M.....Platinum in Grand Canyon.... 309
Bracken a source of potash 162
Braden Copper Co., company report 334
Bradford flotation process 377
Process at Broken Hill.....E. T. Henderson.... 407
Bradley, F. W., reports on Alaska Treadwell and Alaska Juneau groups 833
Brass manufacture .....Editorial.... 369
Ribbon zinc as a substitute for 88
Brazilian manganese exports for 6 months of 1918.... 754
Breckenridge, Colorado, letter 92

Page

Bridge construction, method of 253
Bridges and roads in mining districts 252
Brinell ball-test 244
Brinsmade, R. B.....Iron in Santo Domingo.... 356
Briquetting, new book on.....101, 399
Britannia copper mine, B. C., report 365
British Columbia, mining situation in 127
Platinum in .....C. R. Price.... 850
Sources of gold 361
British Metals Corporation.....Editorial.... 846
Broken Hill, Bradford process at..E. T. Henderson.... 407
Flotation at .....Editorial.... 404
Labor unrest at 458
Broken Hill Proprietary Co., company report..... 878
Broken Hill Proprietary mine, Australia, development of flotation at.....E. T. Henderson.... 375
Broken Hill South Silver Mining Co., company report.. 399
Bromine, derivation of 289
Brown, F. C.....Western mining and religion.... 405
Brown, F. W....Our natural resources of potash.... 759
Brown, W. L.....Rotterdam, distributing centre for the C. R. B..... 381
Buchanan, why worry over.....Editorial.... 39
Buena Tierra Mining Co., company report..... 98
Buffalo Mines, company report 133
Bunker Hill & Sullivan M. & C. Co., concentrating lead ore at 52
Smelter improvements 806
Bunker Hill Mines Co., company report..... 103
Bunyan, F. W.....Sampling.... 827
Burch, Albert.....Status of gold mining....209, 248
Burgess, J. A.....Menace to gold mining.... 177
Burma Corporation, ore-treatment problem..... 800
Burma Mines, heating of ore in 694
Burma, wolfram output in 1917 194
Burnett, F. L.....Chromite scandal.... 747
Burro Mountain mine in 1917 102
Business and inflation after war 526
Butler tin mine, Australia, ore-dressing at 162
Butte & Superior Mining Co., company report.....269, 767
Mine, big welding job at 161
Butte labor situation at end of July 167
Labor troubles 501
Montana, letter.....195, 665, 803
First-aid meet 200
Wages and employees 96
Byler, E. A.....Correction of stadia-readings to horizontal 150

THE HAMILL ORE FEEDER

A Product of Experience

Feeds Uniformly Coarse or Fine Material

Handles Successfully Both Dry and Damp Material

BELT DRIVEN TYPE

Also Furnished in Stamp Actuated Type.

ADJUSTABLE while running, the "HAMILL" can be set to longer or shorter stroke, or to nothing, independently of the speed of the driving pulley or rock-shaft.

SELF-CONTAINED. The "HAMILL" is a unit, light, handy, easily attached to the bin or hung under the stamp platform.

RUGGED, almost unbreakable in its construction with all-steel frame, it will run for years without any repairs, requiring no attention when once set.

REQUIRES LITTLE HEIGHT, little space, and weighs less than half the weight of other feeders.

For Trommels

See this bank of revolving screens. There is a steel plate screen to take the impact of large pieces generally encountered in the run of mine ore. Inside, to do the screening, is where **PERFECT** real screens show to the best advantage.

It's the Double Crimp that counts!

Every wire is kept firmly in place. There is no shifting about as the screen wears down. It also affords the greatest element of strength, every wire being a flat arch, the crimps forming the buttresses. Every particle of crushed ore passes through, if it has attained the requisite fineness. The reject is free from fine particles.

Your next replacement should be **PERFECT.** Write for prices.

Make your next replacement

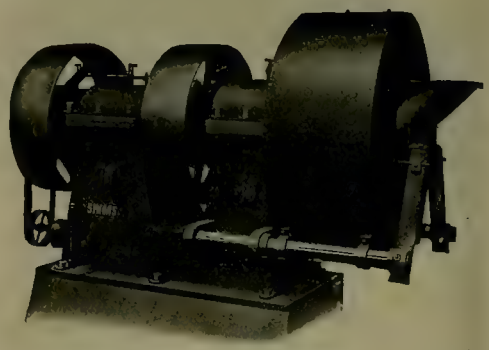
"Excellent result with this crusher"
"Better than rolls."

Wins

On its record in the field - the



Symons Disc Crusher

because——

It is the only crusher which will take the rejections, screened or unscreened, from large standard gyratory crushers and effect a reduction rapidly at one operation to ¾ inch or less.

It is the only crusher which spreads the rock while crushing, it thereby avoiding congestion, choking and unnecessary wear.

It is the only crusher equipped in every case with manganese steel crushing members.

Users of Symons Disc Crushers do not hesitate to tell of their experience. Above are excerpts from letters received.

There is a place in your mill for the Symons Disc Crusher

Are You Producing Any of These?

If so, there is no question about the advisability of your investigating the Oliver Filter.

Its value to you is always proved. YOUR industry is one in which Oliver Filters are in successful operation, which always means increased efficiency and decreased costs.

Why? Because the Oliver is automatic and continuous and needs no operator.

Discharges a residue sufficiently dry to be handled on a conveyor. Delivers a thoroughly washed cake.

See this filter in actual operation. There are over six hundred Oliver installations in the United States, and one of them is near you.

New descriptive Bulletin, THE OLIVER FILTER, ITS USE, CONSTRUCTION AND OPERATION, on request.

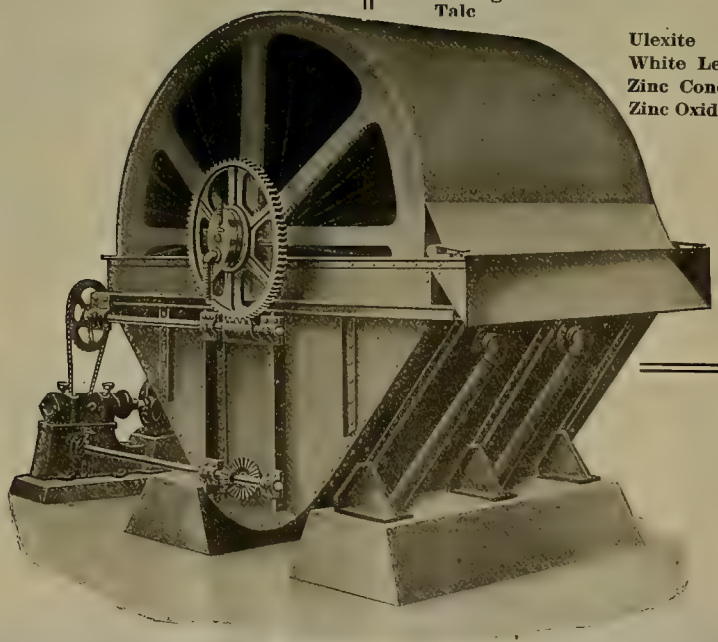
THE OLIVER CONTINUOUS FILTER



To Users of the Callow Pneumatic Flotation Cell—

The recent decision in the Butte & Superior suit with Minerals Separation has an important bearing upon the use of the Pneumatic, or Callow method of flotation.

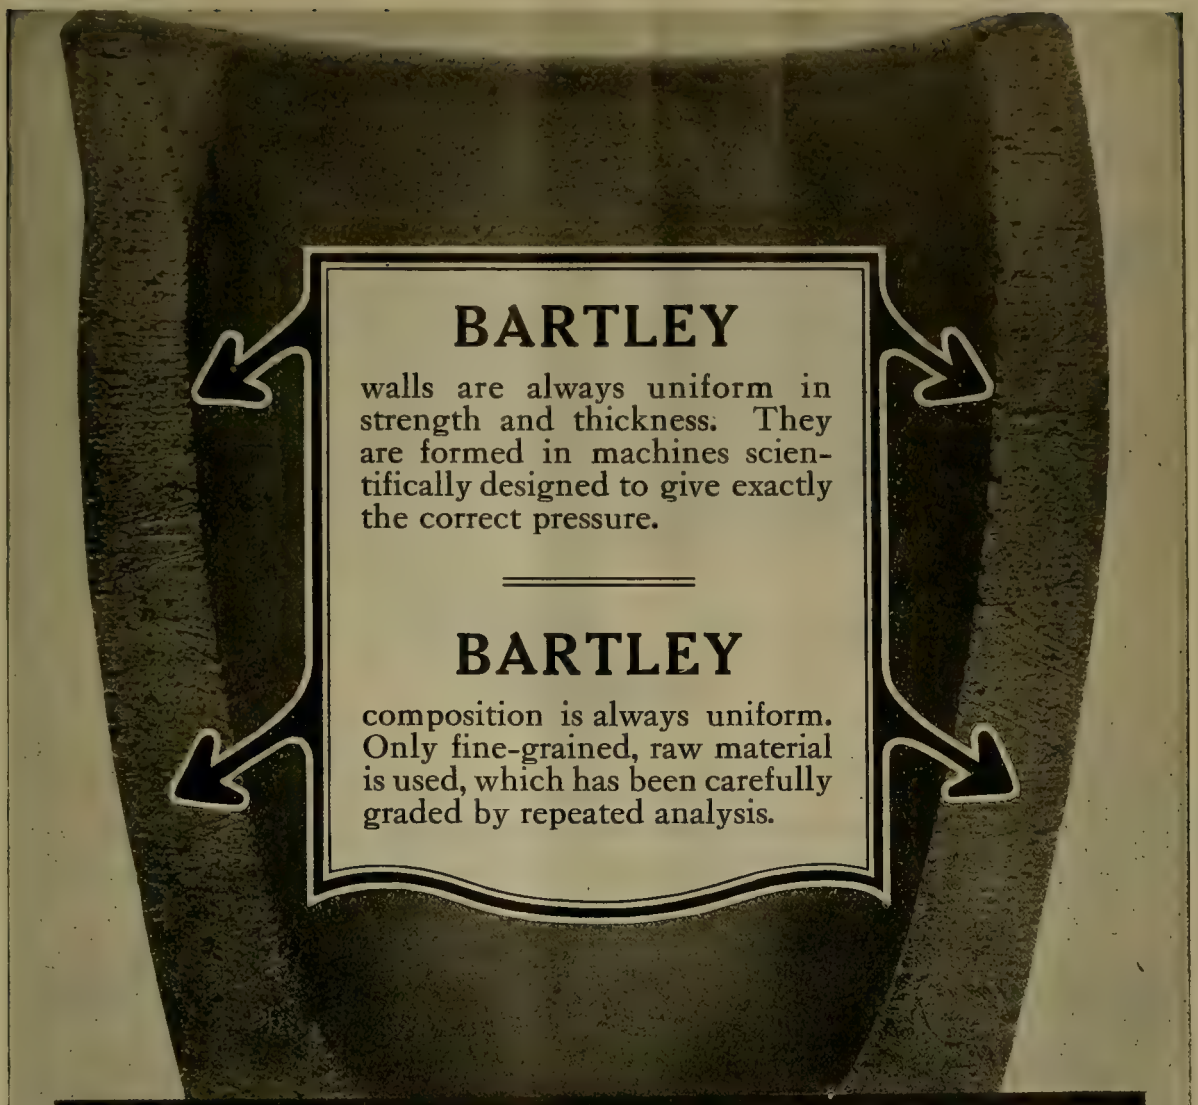
The Appellate Court's decision at Philadelphia, in the Miami case, had already made clear the distinction between (1) froth produced by violent mechanical agitation of the Minerals Separation process, and (2) simple levitation by air bubbles, as practiced in the Callow or Pneumatic cell, without such agitation.

Now the Appellate Court at San Francisco has interpreted the United States Supreme Court's opinion in the Hyde case, whereby the Minerals Separation patent was restricted to the use of a minimum, or 'critical' proportion of oil, in combination with violent mechanical agitation.

This latest decision of the Appellate Court in the Butte & Superior case, restricts the Minerals Separation basic patent to the use of a quantity of oil ***not in excess of ten pounds (0.5%) per ton of ore, in combination with violent agitation;*** it is a logical sequel to the Supreme Court's opinion and confirms the status of the Callow or Pneumatic method of flotation as distinct from the agitation-froth process.

Both the use (1) of oil in excess of ten pounds (0.5%) in combination with violent agitation, and (2) the use of the Callow system of aeration with any quantity of oil, appear therefore to be immune from any charge of infringement.

(Signed) J. M. CALLOW



BARTLEY
walls are always uniform in strength and thickness. They are formed in machines scientifically designed to give exactly the correct pressure.
BARTLEY
composition is always uniform. Only fine-grained, raw material is used, which has been carefully graded by repeated analysis.

Bartley Crucibles

From raw material to finished product Bartley Crucibles represent painstaking effort and critical inspection. These crucibles will give better results and last longer on your work. Proof will cheerfully be furnished.

RED CHIEF MINING COMPANY
CAPITAL STOCK $500,000.00

Casa Grande, Arizona April 29th, 1918

Young & Tyler,
Los Angeles, Cal.

Gentlemen:-

We are pleased to advise you the result of our first large test run of galena ore, which was as follows:

	Lead	Silver	Gold
Heads	4.6%	1 oz.	Trace
Concentrates	21.5	3 "	.80
Deduster	3.0	1 "	Trace
#1 Tailings	.5	Trace	"
#2 "	.5	½ oz.	"
#3 "	.75	1½ "	"

This shows a saving of about 90% on first run product which we consider remarkable for our class of ore. Our heads were lower than expected owing to the fact that a portion of the ore had been screened and the screenings covered up so that they could not be gotten at. The screenings ran 14% lead, 8 ounces silver and $3.00 gold.

Wishing you all the success that you deserve in making it possible for us to handle low grade ore in a dry country, we ask to remain,

Yours very truly,
RED CHIEF MINING COMPANY.
By J. P. Copeming
Gen. Mgr.
TPC

90% Saving
——With the——
Elsol Dry Concentrator

Not an unusual case—even better results are being obtained on certain classes of ore. The Elsol has solved the concentrating problem in the dry mining field.

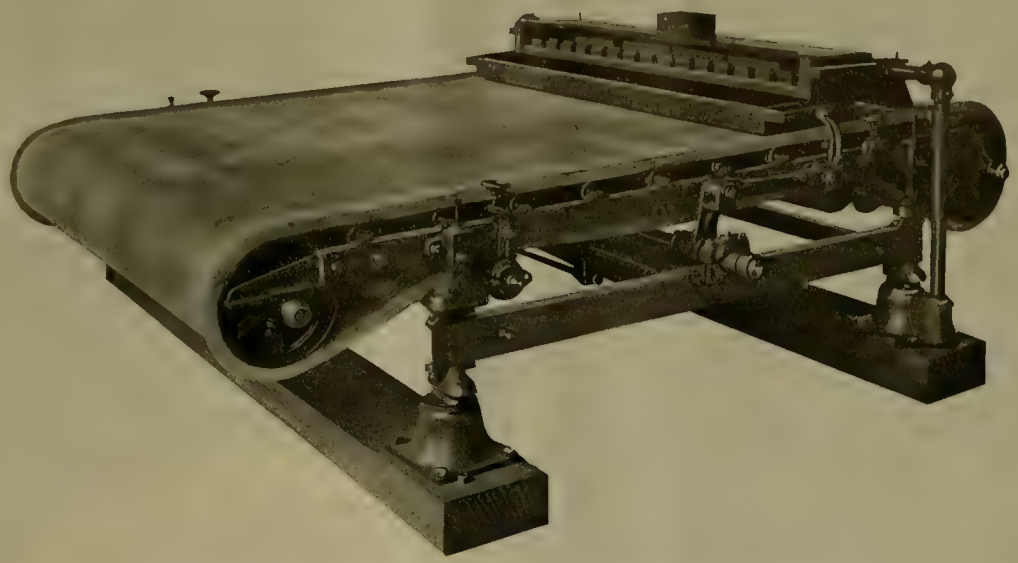
Young & TYLER
430 Wesley Roberts Bldg. Los Angeles, Cal.

1918 Model, Simplified, Ball Bearing
Senn Panning-Motion Concentrator



Capacity;—from 20 Tons of Slimes to 150 Tons of –3 mm. Unclassified Feed, or the Entire Product of 10 Stamps.
Water Required;—2 Tons per ton of solids in the pulp.
Power Required;—3/4 Horse Power.
Shipping Weight;—Domestic, 2700 pounds; Export, 2900 pounds.
Heaviest Box;—Standard Packing, 475 pounds; Special Packing, 300 pounds maximum, if specified with order.
Floor Space;—8 feet 6 inches wide, 9 feet 6 inches long, 3 feet 1 inch high from top foundations to top feed box.

Senn Panning-Motion Concentrators Make Concentration Cheaper

When handling the usual vanner feed or a slime feed, One Senn handles the same load that would require from 4 to 6 vanners of any other make, and it recovers more of the fine or slime values than any other belt machine because its continuous "panning" motion keeps the pulp loose and enables it to handle a much thicker pulp and avoid currents of water that wash away the finest concentrates.

The Price of One Senn is only a fraction of the price of from 4 to 6 "vanners" of any other make, and the Cost of Attendance and Upkeep are Correspondingly Less Per Ton treated.

When handling an Unclassified Feed that would otherwise require "tables", the Senn still handles a thick pulp and it saves the fine values that no "table" can save. Its Capacity is equal to that of the best "table" handling the same material. It is Cheaper because its Recovery is Greater.

One Senn is handling the entire product of 10 stamps, or their equivalent, in each of a number of California gold mills; 4 Senns are handling from 150 to 200 tons per 24 hours of –80 mesh silver-gold ore in a Nevada mill; 30 Senns are handling the entire Flotation Tails from a 1400 ton copper mill in New Mexico, and 6 Senns have been installed to take the Flotation Tails from another 300 ton mill; in a mill in Canada, Senns are "roughing" the 3 mm. unclassified feed and finishing the Flotation Tails. Senns have been and are being installed from New Brunswick to New Zealand, to handle gold, silver, copper, lead, zinc, tungsten, chrome, wulfenite, etc. They are called upon to handle all sorts of materials upon which others have failed—and they do it.

"Handling" a certain tonnage, when applied to the Senn, means Making The Maximum Recovery from that tonnage, in Clean Commercial Concentrates; not merely the passing of that tonnage over the machine nor making a concentrate so dirty and low grade that it must be cleaned before it can be considered a commercial product.

The Millman "Pans" His Tailings to Check the Work of His Concentrators

The Senn Will Save All The "Pan" Can Save

HAUL
Your Light Loads
The "Little Tugger" Way

Man or mule power will do your hauling—but the cost will be lessened by substituting "Little Tugger."

With it a single workman can haul one, two or three cars up an incline or as conveniently lower them. You save the cost of keeping a mule or the time of other workmen.

"Little Tugger" operating costs are negligible.

You can clamp or bolt it anywhere and use it for any of the odd jobs of hoisting and handling. It will lift weights up to 1000 lb. or haul much greater loads. It is portable, entirely self-contained and can be operated by anyone.

Bulletin 4233 gives full details.

The Monotony of Unusual Performance

DUPLEX 4-WHEEL DRIVE

11th YEAR

TO DUPLEX 4-Wheel Drive Trucks, the unusual is the commonplace! Breaking records has become a matter of course.

To us, Duplex performance is nothing to wonder at; it is expected—planned, and pre-determined. This is why we rarely cite definite cases of Duplex achievement, such as the following:

Between Edgewater and Paterson, N. J., is the famous—or infamous—Fort Lee hill. It's a mile long and has grades up to 17 per cent. Doesn't sound difficult to negotiate?

No! But the bottom abounds in deep chuck holes; the middle is a mass of soft asphalt; the top section is rough cobble stones. As good measure there's a hair pin turn on the last lap.

Still, it's **negotiable**—for an automobile or a lightly loaded truck. But the Duplex was neither!

At Edgewater they gave the Duplex eight thousand pounds of sugar to **carry**—and another six thousand (loaded on a trailer) to **haul.** All told, the load totaled **seven tons.**

Summarized, the conditions were:

A stiff grade; bad road surface; difficult turn where the grade was steepest; seven tons on truck and trailer; new, stiff engine.

The 3½-ton Duplex made it!

Made it in twelve minutes. Made it without difficulty, although in places the soft asphalt was two inches deep.

Then it completed its 50-mile run on a total gasoline consumption of seven gallons, and at a cost of four cents per ton mile.

* * * *

To us this performance is not particularly startling; to us such accomplishment is perfectly natural. But here are quotations from truck **users**—who keep careful tab on all trucks.

"Seven miles to the gallon with four tons on truck, and pulling a trailer carrying three tons is indeed a marvelous performance."

"It does not seem possible that any truck . . . . could obtain such remarkable mileage."

"In all my records which cover the operation of 1400 different trucks I can find nothing to compare with it."

* * * *

The Fort Lee hill performance was unusual as a **motor truck** achievement, and **not** unusual as a Duplex accomplishment, simply because such ability is built into every Duplex truck. Exclusive principles — correct designing — careful construction — and ten years spent in doing it—help us produce a truck that is so dependable.

Duplex Truck Co., 2038 Washington Ave., Lansing, Mich.

NORDBERG HOISTS

FOR years Nordberg Hoists have been the first choice of mining experts. The largest hoist in the world—with a rope pull of 42,000 pounds, and a hoisting speed of 6,000 feet per minute—was built by Nordberg.

The hoists that hold the record for operating efficiency are Nordberg hoists. We have built hoists for almost every conceivable condition of load, depth, speed and driving power.

NORDBERG HOISTS

will enable you to hang up new records for daily, weekly and monthly production. Their use effects many unexpected economies in mine operation.

Write today for full particulars of the Nordberg Hoist. You will never invest a three-cent stamp to better advantage.

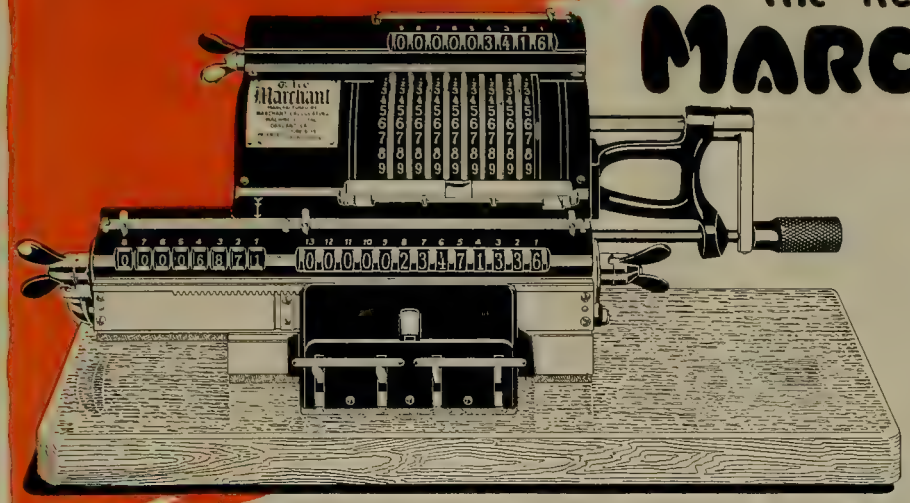
A Perfected Calculator - the new MARCHANT

Pony Special "A"



Hand figuring is obsolete—you do not permit out-of-date methods in the mine or mill. Why allow **time wasting** pencil calculation in the office?

The **MARCHANT** Pony Special "A" meets the need for a convenient calculator which may be easily carried by the mining engineer and others whose work often requires a portable instrument.

It possesses all of the features of speed, accuracy, and simplicity of operation which have made the Standard **MARCHANT** a general favorite.

It may be easily carried—weights but twelve pounds—measures eight by twelve inches at the base. It is **absolutely accurate**—all work is **automatically proved.**

The Top Register Dial a distinct new feature

gives a **double check** on every calculation. The figures placed on the setting levers are registered on the top dial also—every step is visible to the operator.

Investigate this new **MARCHANT** Pony Special "A." Mines, mills, and smelters have found it invaluable. Tonnages, averages, percentages, and costs figured easily, quickly, and accurately.

Test the MARCHANT in your own office

Cochise Drills

—in the daily grind of actual service

Day in and day out under all sorts of conditions, COCHISE DRILLS are cutting drilling costs to a minimum.
Economical air consumption—great power and long life are the outstanding features of COCHISE DRILLS. A miner who has run a COCHISE will give it preference over any other type.

Size for size COCHISE ROCK HAMMERS have other drills beaten for effectiveness and economy.

They will drill greater footage—use less air and stay underground longer than other types.

Our claim to much greater footage at less air consumption is not idle talk.

We are ready to prove this to your own satisfaction.

COCHISE DRILLS must make money before you pay any out.

Arrange with us for a free demonstration on your own property

Kennedy Gyratory Crusher — Standard Discharge

Kennedy Gearless Crusher Showing Sheave Drive and General Construction

Kennedy Crushers

KENNEDY GYRATORY CRUSHERS and **PATENTED GEARLESS CRUSHERS** lead because they are the result of a demand for a stronger and more durable crusher than has yet been put upon the market and one that would handle larger quantities of rock and ore without the attendant difficulties encountered in some of the older and somewhat antiquated types.

THE KENNEDY GYRATORY and **GEARLESS FINE CRUSHER** have patented ball and socket, self-aligning eccentric that can be run for years without the eccentric rebabbitted. This item alone will more than pay the interest on the crushing plant, to say nothing of the increased capacity which is the result of a constant eccentricity.

This is only one of the many important features found in the **KENNEDY CRUSHERS**. Our catalogs contain illustrations and descriptions of the latest and most modern **GYRATORY CRUSHERS**. While we have not attempted to imitate other makes, we have not departed from the settled practice in the general design of **GYRATORY CRUSHERS**; we have applied modern and up-to-date mechanical features to the principal working parts, which will be at once recognized and appreciated by the skilled operator and engineer as being vastly superior to anything that has yet been designed.

Bulletin No. 2 on the **GEARLESS FINE CRUSHER** will be very interesting to you, as it describes fully this very superior **FINE CRUSHER**. You should acquaint yourself with this new equipment; it will prove a revelation.

Collins & Webb, Inc.

Manufacturing Engineers and Machinery Dealers

412 E. Third St., **Los Angeles, Cal**

in Their Class

The Isbell Concentrator

leads, because —

It will treat a mixed pulp direct from grinding screens as coarse as 6 mesh **without preliminary classification** and save both the slime, fine and coarse concentrate.

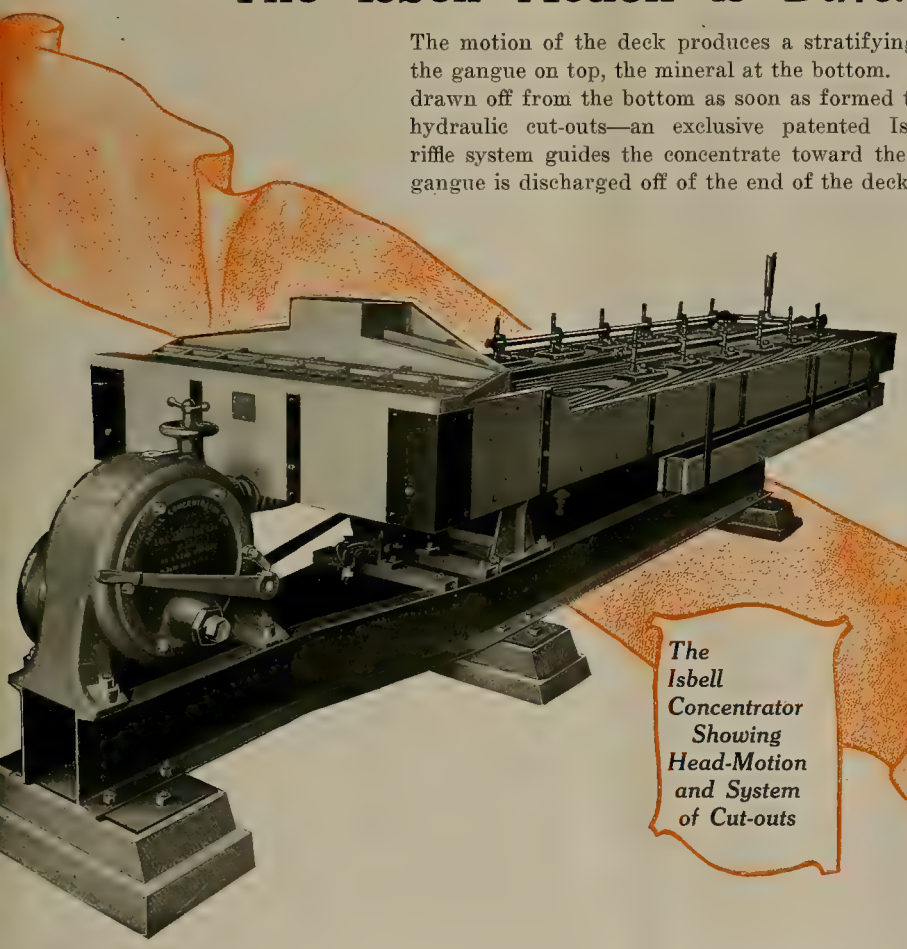
Uses absolutely no cross wash-water, therefore no loss of slime. Saves the cost of classifiers, sizers, settling tanks, vanners or "slime tables," with their necessary power and transmission, mill floor space, etc.

Has a capacity with recovery equal to the average of four of the cross wash-water type of table—treats 50 to 100 tons per 24 hours.

Most substantially constructed concentrating table ever made—the Isbell patented head motion is simplicity itself—self contained, self oiling and trouble proof.

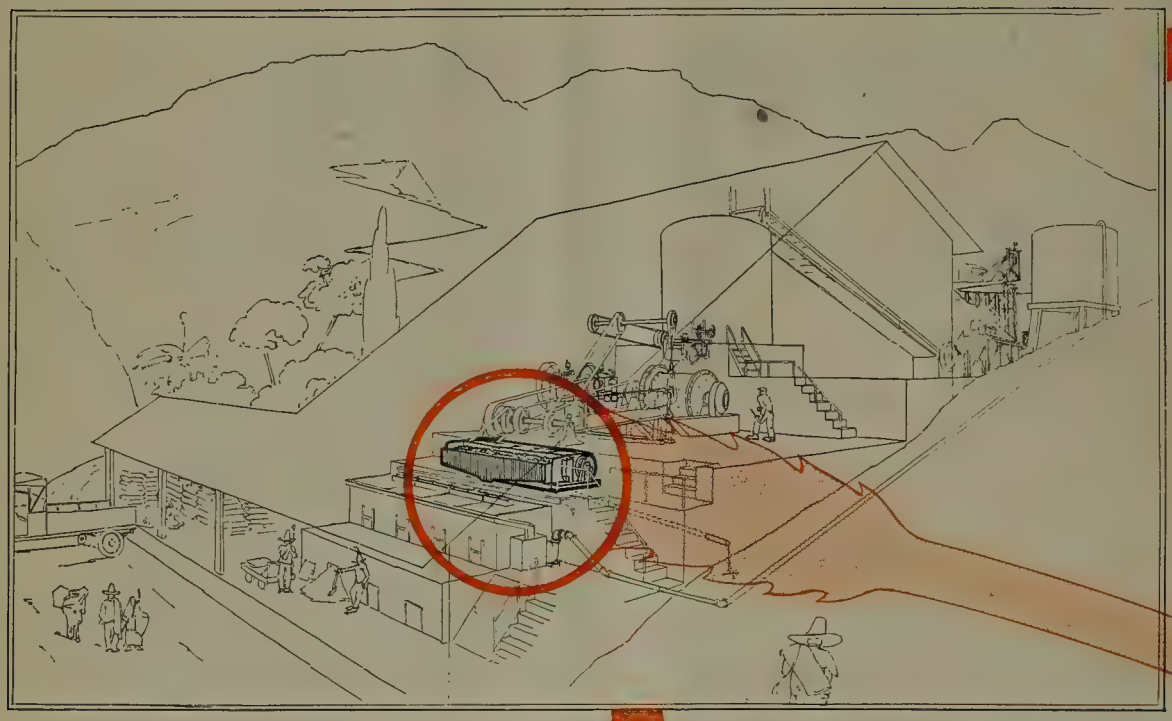
The Isbell Action is *Different*

The motion of the deck produces a stratifying action at once—the gangue on top, the mineral at the bottom. The concentrate is drawn off from the bottom as soon as formed through a series of hydraulic cut-outs—an exclusive patented Isbell feature. The riffle system guides the concentrate toward the cut-outs while the gangue is discharged off of the end of the deck, a clean tailing.



The Isbell Concentrator Showing Head-Motion and System of Cut-outs

INVESTIGATE THE ISBELL TODAY. IT OFFERS POSSIBILITIES FOUND IN NO OTHER TABLE. A BULLETIN CONTAINING VALUABLE INFORMATION WILL BE MAILED ON REQUEST. SEND FOR IT.



The K & K Flotation Machine in a typical plant. Note the compact get-at-able-ness of the entire arrangement.

Flot
Mac

One Continuous Operation

From pulp to concentrate—and no lost time. A continuous operation is afforded during which separation and discharge take place. Note the typical installation above. The feed enters at one end of the machine, the tailings being discharged at the opposite end while the concentrate is discharged over the lip of the "frothing chamber" into a suitable launder. Everything necessary to complete separation is accomplished in one operation.

If you are considering the installation of flotation equipment you cannot afford to overlook the K & K. There have been many instances where it has turned flotation from a failure to a success. Our metallurgical department had made a study of the difficulties presented by different ores which hitherto were not considered amenable to flotation. We have valuable information on the treatment of carbonate ores and have worked out many knotty problems by flotation.

Let us aid you with the information we have secured. Write today for our new and complete catalogue.

Southwestern Engineering Co.,

523-526 Wesley Roberts Bldg., Los Angeles, Cal.

A Complete Flotation Unit

ready for business the minute you set it up. Connect up with power—introduce your flotation feed and the machine does the rest. No pre-agitators, compressors or other auxiliaries required. Automatic control requiring little or no attention.

The K&K ation hine

Large Capacity

Largest machine treats 80 to 150 tons per 24 hours; smaller sizes also made. The K & K cycle of operation delivers the concentrate in the shortest possible time—therefore the high capacity.

Low Power Consumption

Requires but 6 to 8 H.P.—no violent churning or agitation with the K & K. The rotor is the only moving part and is mounted on ball bearings producing minimum friction losses.

Low Up-keep Expense

There is practically nothing to wear out about the K & K. The only wearing parts are the riffles which are easily and cheaply replaced.

Small Floor Space

The K & K requires about half the space for installation needed by other machines—only 4½ x 15 ft. for the largest size. Also very little head-room is needed. This has made its use possible in many cases where larger apparatus would have caused considerable expense for re-arrangement.

THE JORDAN SPREADER

"DOES THE WORK OF AN ARMY OF MEN"

In Mine, Mill, and Smelter Operations

Where you have 8 or more men employed in spreading waste dumped from cars the Jordan Spreader can be used economically in their place and anything dumped from cars such as ore, slag, tailing, fuel, etc., may be handled with the Jordan.

JORDAN USERS
include
Oliver Iron Mining Co.
Utah Copper Company
New Cornelia Copper Co.
Calumet & Arizona Smelting & Refining Co.
M. A. Hanna Co., Northern Michigan Mines,
etc. etc.

It Entirely Eliminates Gang Labor

As a saver of money, time and labor, the Jordan Spreader is in a position by itself. Moving and Spreading all classes of material up to 75,000 cu. yds. a day at a cost of ½ mill per cubic yard it displaces hundreds of men at a cost that is insignificant.

One man and a train crew operate the Jordan Spreader

It is built to last a life time. The upkeep and repairs are insignificant. Many Jordan Spreaders have been in use for more than twenty years.

Send for a catalog and let us tell you what Jordan Spreaders will do on your particular work

THE O. F. JORDAN COMPANY Chicago and Kennedy Aves. EAST CHICAGO, INDIANA

DODGE

Belt Conveyors

The Dodge line of equipment for the continuous handling of materials by belt or bucket is most complete.

Dodge service in the elevating and conveying field is comprehensive and is exceptional because of our wide experience also in other and closely related branches of transmission engineering.

The intensively specialized facilities of the Dodge companies concentrate, upon the production of each pulley, bearing and other part of conveying and elevating installations, the highest engineering and manufacturing skill.

Many distinctive features, such as interchangeability of parts, special facilities for adequate and positive lubrication, and other refinements of design —coupled with general excellence of detail and finish—insure smooth and continuous operation.

Upkeep costs thereby are minimized perceptibly, and efficiency is established at the high standard rigidly maintained for Dodge installations of every kind.

Whether your requirements in the elevating and conveying line are large or small you will find, in Dodge equipment and in Dodge service, values important to elevator and conveyor users in all branches of the mining industry.

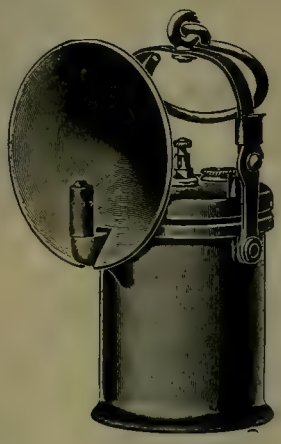
WOLF

Acetylene Lamp



Highly regarded wherever used—

"With a Wolf lamp there is less time wasted in the mine. The next property I get will sure have the Wolf Lamp in preference to any other."

"Your Wolf lamps are used exclusively in the Daly Mine * * * it is the only practical and successful carbide lamp that will stand up and give the satisfaction the Wolf does."

" * * * Wolf lamps operating at a total cost of 2½ cents per 10-hour shift."

This is what three users say—there are scores of similar instances.

The Wolf Acetylene Lamp is sturdiness personified. It is made of drawn-steel and heavily tin-plated or made of sheet-brass.

The burner is of such excellent quality lava that one man has constantly used a single tip for four years.

Gives a brilliant light, burns cleanly, operates most economically, is entirely dependable, and is reasonably priced.

We can furnish two or two thousand lamps. Write for details and quotations.

No Matter What Your Crushing Problem

Get a TRAYLOR JAW CRUSHER to Start

We illustrate our Type B Crusher, made in the following sizes: 15x48", 15x60", 24x48", 24x60", 30x48", 30x60", and 30x72", with one piece cast steel frame of box section, water-cooled cast steel pitman, and water-cooled main pitman shaft bearings.

This is only one of five types of jaw crusher which we make in 36 sizes, ranging from the little 7" x 10", weighing 8000-lb. up to the Giant Crusher, having a jaw opening of 66" x 86", and weighing 680,000-lb.

They're all fully described in Bulletin J-2. It's just off the press.

THE MODEL 8 "WAUGH" SHARPENER

The highest efficiency in sharpening and shanking steel is only obtainable with the Model 8 "Waugh" Sharpener. In actual service it has demonstrated that it produces perfectly worked bits and shanks in the *shortest possible time* with the *minimum consumption of air.*

Not only will it use less air at equal pressures than other machines, but it will operate effectively on lower pressures than are required by machines of similar capacity.

The illustration shows one of two Model 8 "Waugh" Sharpeners at the Empire Copper Company's mine, Mackay, Idaho.

EDITORIAL

NOTES 1

JAMES DOUGLAS 2

The passing of James Douglas, the dean of the mining profession in America; outline of his career; co-operation with T. Sterry Hunt in metallurgic invention; identified with Phelps, Dodge & Company; developed some of the largest copper mines in the world; distinguished also as a historian; his influence on exchange of technical information; his democratic ideals. M. & S. P., July 6, 1918.

THE TARIFF HEARING ON METALS 3

Steps toward preparedness in making America economically self-sufficient; function of the U. S. Tariff Commission; the policy of protection; a tariff to promote a benevolent peace; testimony on the status of antimony, mercury, and tungsten industries; decline in production after the War inevitable without tariff restrictions; present production limited by lack of guarantees; need of the War Minerals bill. M. & S. P., July 6, 1918.

ARTICLES

THE PRODUCTION OF QUICKSILVER AND TUNGSTEN 5

Tables of production and prices; cost of quicksilver production in America, Spain, and Austria; low-grade ores and low recovery in this country; protection needed to develop large low-grade orebodies; metallurgic improvements; outline of the condition of mines and stocks on hand by J. H. Mackenzie; cost of production; German-owned mines idle; guarantee of prices for a period needed to stimulate production; development of large low-grade mines depends on protection. M. & S. P., July 6, 1918.

THE WAR-MINERALS BILL

Testimony of Walter R. Ingalls 9

Fears that mines of copper, lead, and other metals might fall within the operation of the bill through control of accessory metals; thinks no stabilizing of the market is necessary; Government has all the authority it needs; no necessity for Government intervention in producing such things as magnesite, mercury, or tungsten; Government should go out and get what it needs, as would be done in business; has observed no desire anywhere to hold up the Government; objects to price-fixing. M. & S. P., July 6, 1918.

OUR WAR-FINANCE PROBLEM 18

Total Government expenditures from July 1, 1917, to May 15, 1918; sources and amounts of revenue; advances to our Allies; estimated requirements. M. & S. P., July 6, 1918.

CUNNINGHAM PASS DISTRICT, ARIZONA

By W. Tovote 19

A 'poor man's' copper district; 20 years experience shows large returns per man from small rich veins; ore contains copper and gold; desirable fluxing quality. M. & S. P., July 6, 1918.

HOISTING WITH STEEL CABLES

By Ernest Levy 21

Practical discussion of causes of breakage, and points on cable that most often fail; methods of inspection; rules for maintenance of cables. M. & S. P., July 6, 1918.

ALUMINUM IN GERMANY 22

Account from a Germano-Hispanic source of condition of the aluminum industry in the Central Empires; a new type of deposit in Alta Hesse; recent metallurgic improvements. M. & S. P., July 6, 1918.

THE BASIC PRINCIPLE OF CONCRETE MIXES

By Duff A. Abrams 23

Experimental data showing great increase in strength of concrete from proper proportioning of water; sloppy concrete is weak. M. & S. P., July 6, 1918.

Let Us Help You Serve Effectively

Service is vitally necessary in business today that we may pull together to accomplish our common aim.

The General Electric Company has located industrial power experts at all large cities in this country to serve industry's electrical requirements. For instance, experienced textile mill electrical engineers will be found in all textile centers. Among other industries so served are the iron and steel, coal and metal mining, cement, clay and glass, lumber and woodworking, grain and sugar, canning, packing and refrigeration, shoes and rubber, paper and wood pulp, tobacco and cigars, chemicals and gas, and the construction and shipbuilding.

These experts are prepared to cooperate with industrial engineering firms to show the best way to drive a machine or a factory to get maximum production of highest quality at minimum power cost.

Back of these experts is the experience gained in supplying much of the electric power equipment now used in American industry and a corps of scientists with research facilities for pioneer work.

Call on us to help perfect your service to American business.

GENERAL ELECTRIC COMPANY

General Office, Schenectady, N. Y. Sales offices in all large cities.

43-43

NEVER since the Declaration of Independence has the Fourth of July been celebrated so worthily. On the 142nd anniversary the United States is making good the Declaration by fighting for its own safety and for the safety of the allied democracies against a tyranny as much worse than that of the German-English King, George III, as it is more menacing to human liberty elsewhere. This Fourth is not only a national holiday, it is an international celebration in which 23 peoples participate enthusiastically.

HOUSE Resolution No. 291, introduced by Mr. James H. Mays, of Utah, proposes to extend to oil-shale placer locations the Act suspending the requirements of annual assessment work upon mining claims for the years 1917 and 1918. The wording is not specific as to how the exemption shall apply for the past year, but an amendment will probably cure this defect before the measure becomes law.

ALUMINUM is so essential to the construction of aeroplanes that a vulnerable point in the German structure appears in the circumstance that her main dependence for bauxite is upon the mines near Sebenico and Derins in Dalmatia. Sebenico lies but a short distance from the sea. If this source of supply could be cut off the effect upon the size of the German air fleet would soon become apparent. Elsewhere in this issue we publish a statement of German methods of reducing aluminum ores.

FROM Washington we hear that the recent meeting of the Institute was an unqualified success. On the invitation of the Food Administrator the engineers dined at the Food Administration cafeteria. A number of speeches were made on patriotic effort, more particularly on the winning of metals for use in the War. Mr. Hoover himself spoke, we are informed, "most effectively." Other speakers were Messrs. Sidney J. Jennings, R. V. Norris, William L. Saunders, and Pope Yeatman. A new section of the Institute was organized.

IMPORTATION of 12,000 tons of ferro-manganese from Great Britain has been authorized by the War Trade Board to offset the shortage of ore in this country. The American Iron and Steel Institute, through its subcommittee on ferro-alloys, has recommended that the standard for ferro-manganese be reduced from the present requirements of 78 to 80% of manganese to 70%, and that spiegeleisen shall contain from 19 to 21%. It is proposed that the new standards be accepted as 'good delivery' under existing contracts, with suitable adjustment of tonnages and prices. These recommendations are made in order to conserve shipping and to encourage the utilization of domestic ores as far as possible. The importation of ferro-manganese, therefore, is only a make-shift until the supply from our own mines shall respond more fully to the needs of the steel industry.

AN interesting statement is made by Mr. G. J. Kapteyn, a Dutch engineer recently arrived in this country from Holland, that United States gold notes are in great demand in his country, whence they are smuggled into Germany. The normal money-changer's value of American currency in Holland is 2.45 florins on the dollar; the present rate is 4.85. At the same time the rate for British currency is 13.6 florins per pound sterling, as opposed to 12.1 before the War. The inference is that the Germans are playing safe, and that they entertain a strong conviction that England and America will still loom large on the map when the smoke of battle has cleared away. Nevertheless, we think that the Germans have not yet been punished as much as they deserve, otherwise the premium on our currency would be higher. At the same time we note Mr. Kapteyn's earnest plea for a generous compromise peace with the Teuton, from which it would appear that Holland is too close to Germany to admit of seeing things from the Allied point of view.

THE War-Minerals bill, as passed by the House, is now before the Mines Committee of the Senate, where it has been held in abeyance pending the return of Senator Henderson. The House struck out the principal clause, namely, that authorizing the President, through the Secretary of the Interior, to guarantee a fixed minimum price on specific minerals for a period not to exceed two years. It is expected that the Mines Committee of the Senate will restore this proviso, without which the Bill is emasculated to the point of uselessness. A decision in this matter is due at any moment, our hope being that an alternative clause, embodying the one deleted by the House, will be added, so as to give

effect to the original purpose of the Bill. Elsewhere in this issue we publish the testimony of Mr. Ingalls, whose opposition to the Bill is noteworthy. If he made out a much poorer case than Mr. Manning, who testified for the Bill, we may assume that he was handicapped by the weakness of his case.

RAFFERTY, FRANK A., Armagh, Ireland, is the first name in a recent casualty list. He was a corporal and was "killed in action," fighting in the American Army. We salute this good citizen; it is he, and others like him, that will solve the Irish problem. When Irishmen are fighting and dying for the cause of human liberty, whether they be enrolled under the American or the British flag, they are making good the claim to Home Rule, and they are shaming those that stay at home to make political trouble at a time when complete unity of effort is essential. When a man is in a fight, for a right cause, he is impatient of a friend that stays out of it, and he has no use for his friend if he fail to come to his aid, no matter what the reason—least of all politics. The Irish have a sense of humor; they will see that so long as other Irishmen are fighting in France it is absurd for their comrades to remain in Ireland talking. "Come on, boys, the water is fine!" Don't wade in the shallows of a domestic squabble, but plunge like brave swimmers into the deep waters that will wash the world free from Prussian bestiality.

AT a time so critical, when our heart-strings vibrate continually to news from the battlefields in Europe, it is a pity that the editors of our daily papers do not place the selection of head-lines in the hands of grown men—that is, mentally grown. Most of the head-lines appear to be concocted by ignorant boys. We read "Austrian Line Broken," as in truth it was two weeks ago, but the head-line we quote referred to a local skirmish. If the British make a successful raid, the 'Huns are Hurled Back"; if our American boys are successful in an affair of outposts, it is "Another U. S. Victory"; if the French advance a thousand yards on one flank, it is "Germans Crushed by the French," although concurrently the other flank may have been compelled to retire several miles. We have had some notable successes lately, especially on the Italian front, and our own Army is beginning to make itself felt in no uncertain way, but it is only childish to exaggerate every little affair in which our men or those of our Allies are successful. The daily exaggeration of bits of good news destroys the true perspective of the great events that we are witnessing through the turbid medium of newspaper correspondence. It is time for editors to appreciate the dignity of history in the making.

NO peaceful settlement of the issue between the Allies and the Enemy is possible so long as the leaders of Germany talk in terms that to us are incomprehensible. The recent speech of the Kaiser and the speeches made in the Reichstag by Von Kuehlmann and Von Hertling are couched in language that indicates methods of reasoning utterly different from the rest of the world. There is such a failure to recognize facts as we see them that these German pronouncements might as well be published in Mars as in the Allied countries. The Kaiser says that the War is due to the Anglo-Saxon ambition to dominate the world; Von Kuehlmann says that Russia is the culprit. At first England was chiefly to blame, because she did not remain quiet when the German armies used Belgium as a road to Paris; now England is only third in blame, the first place being given to Russia and the second to France. The German Secretary of Foreign Affairs says that Germany asks for "a free existence within the boundaries drawn for us by history." What historian is to decide? Treitschke? The reading of history has manifest subjective limitations. Germany desires "the freedom of the seas." Our notion of freedom is not the same as the German, and that is why we are fighting. The German idea is unrestricted submarine piracy, ours is that the seas shall be free to peaceful commerce. Germany desires "overseas possessions corresponding to her greatness and wealth." She has shown striking incapacity to administer her colonies. The vaunted greatness of Germany is being prostituted to brutal aggression and to bestial warfare; her wealth was used for insidious propaganda and the secret penetration of her neighbors; we recognize no claim for dominion based on the superiority suggested, on the contrary we hold that her actions have proved her entirely unfitted to control peoples other than her own. It is satisfactory to note a recognition of the fact that the end of the conflict "can hardly be expected through purely military decisions alone," but the blatant boast of the Kaiser and his generals has been for four years that the "good German sword" was going to settle the question. Just now it is the purpose of the Allies to prove that there are better swords than the Germans, and that free men fighting for liberty can use them not only to defend themselves but to cut through the sophistries and insincerities of the Potsdam conspirators, who now stand unmasked and unashamed before the world.

James Douglas

Edmund Garrett, the editor of the 'Cape Times,' said that two things made life worth while: friends and the hope of being effective. He achieved both, although he died at 42. A few days ago there passed James Douglas, at the age of 81, after a long life as effective in service as it was rich in friendships. Born at Quebec, the son of a physician, he became a resident of the United States in 1875. He began his career as a professor of chemistry in his native city and early became associated with Thomas Sterry Hunt in developing the hydro-metallurgy of copper, one result of which was the invention of a process that holds an honored place in the history of the art. Later he became mining engineer to the founders of the Phelps Dodge Corporation, and guided

them in the development and exploitation of copper mines in Arizona, and the South-West generally, until he became identified with some of the biggest and most successful mining enterprises in the world. His standing as an engineer was recognized by his being twice elected president of the American Institute of Mining Engineers, and by other honors, including honorary degrees from universities. Despite the preoccupations of a successful professional career, he found time to write, not only many valuable technical papers, but several pamphlets and books of a scholarly character, such as 'Old France in the New World' and 'New England and New France.' He was keenly interested in the history of America on both sides of that boundary which needs no forts to guard it; more than this, in his own person, he illustrated the solidarity of sentiment and the unity of purpose that now animates the three great democracies of the world. James Douglas was sagacious rather than smart, he was wise rather than clever, he was the James Bryce of mining; like that distinguished Scottish author and diplomat, he had a kindly humor, a keen insight into the character of men, a philosophic outlook on life, and an unfailing kindness for those less fortunate than himself. How many there must have been during the last few days that stood up to say, "He helped me when I was a young fellow," "He encouraged me in my work," "He gave me the suggestion that led to my success." Blessed are the old when they leave such a trail behind them—a trail on which the forget-me-nots grow.

When the newspapers announced his passing, one spoke of him as a "copper magnate," another as a "millionaire." How he loathed such terms! Magnates and millionaires are cheap compared with such as he. They may, like him, be magnificent in their financial benefactions, for he endowed universities and hospitals, but he gave much more, he gave the priceless gift of human sympathy, as warm as it was intelligent. He was unassuming, simple in manner, unaffected, he preferred the Mr. to the Professor or Doctor that was his by right, he was unfailingly courteous, in a way that we call old-fashioned because it has become uncommon in the rough and tumble of modern life. He was a gentleman of the old school, to whom belonged peculiarly "the grand old name of gentleman, defamed by every charlatan, and soiled by all ignoble use." As a mining engineer he held to his ideals, setting an example of the most stimulating kind during half a century of professional work. He took a strong stand on a matter vital to technical progress: he was opposed to secrecy in the arts. Twenty years ago he attacked the "mistaken reticence" that leads metallurgists to hug their experience to themselves; he contrasted "the wasteful effects of secrecy" with "the nobler practice of mutual helpfulness." True to his own preachment, he gave freely from his individual store of knowledge, to his acquaintances as to scientific societies in formal assembly. He agreed with Bacon in holding "every man a debtor to his profession, from the which as men of course do seek to receive countenance and profit, so ought they of duty to endeavor themselves by way of amends to be a help and ornament thereto." A help and an ornament to his profession he was. These to his memory.

The Tariff Hearing on Metals

The most important result, so far, of the calamitous end of our trust in international harmony has been to reminds us of Washington's warning to be prepared. We have discovered also that a vital condition for national protection is economic self-sufficiency; we have found how perilous it is to depend upon supplies of potash from Germany, of nitrate from Chile, of chromium from New Caledonia, of antimony from China, and of manganese from Brazil, Russia, and India. With the utmost desire on the part of England, France, and Brazil to help us in this emergency, the scarcity of shipping renders their goodwill of small avail; we are forced to develop, hurriedly and inadequately, our own latent resources. The argument that flows logically from this is that we should encourage the development of every essential material at all times by a consistent use of the tariff. That was the thought lying back of the hearing conducted by the United States Tariff Commission last week in San Francisco, on which occasion the status of the antimony, quicksilver, and tungsten industries was considered. This is looking toward the future, when the fighting is over, when we may lay our plans for a better ordered economic system. The chairman of the meeting, Mr. W. S. Culbertson, called attention to the scope of the activities of the Commission, with the desire to extend its usefulness. Because a hearing is given to the representatives of some particular industry the inference must not be drawn that immediate steps will be taken to establish a duty upon the article concerned. As now constituted the Tariff Commission is purely advisory to Congress; its duties are to collect and collate data that may serve as a guide to Congressional legislation; it performs no star-chamber functions, but gathers its information openly and records it for the use of the people. The time may come, and should come, when a more scientific organization of government will result in giving to a tariff commission the duty of adjusting the tariffs themselves according to fixed rules for equalizing competition, but this transcends any conception that yet seems to have entered the minds of our law-makers. That is for a wiser and saner future, when we shall honestly and seriously endeavor to establish a benevolent peace throughout the world, instead of the cut-throat peace before the War that offered Germany an opportunity to levy unjust tribute upon all nations. Our present duty is to proceed as if altruism were a forgotten ideal, and to shelter ourselves under protective laws. To this end we must remember that the Tariff Commission is a permanent institution; that its headquarters are at Washington; and that it seeks all the information obtainable regarding every industry. Its activities are not confined to public hearings, like the one just held on the minor metals; it welcomes data that any producer may choose

to submit, by letter or otherwise, at any time. The trouble with the mining of antimony, tungsten, and to some extent with mercury, these being the metals discussed at the conference with the Commission in San Francisco, is the erratic character of the orebodies, and it was clearly shown by the evidence that a relapse to the inactivity existing before the War is inevitable unless protection be accorded. Details of the testimony on antimony were presented in our issue of last week, and a summary of the evidence on quicksilver and tungsten appears elsewhere in this number. The special problem presented by quicksilver is the treatment of low-grade ores. Unless that can be done successfully the industry will languish. Mr. L. H. Duschak has just completed a valuable study of the metallurgical methods adaptable to low-grade ores, and we hope to publish it shortly. He shows that a 90% recovery is practicable here as well as in Austria, whereas American practice today returns only about 75% of the total mercury content of the ore. Mr. H. C. Davey, of the Guadalupe mine, in California, showed that as much as 75% of the costs of production were chargeable to exploration. An increase in the percentage saved would alter that figure, but we may accept the statement of Mr. H. W. Gould, of the New Idria company, that a specific duty of $35 per flask, in addition to the existing tariff of 10% ad valorem, is essential for ensuring the industry against decline. The average grade of Californian deposits is about 0.4%, while the Spanish ores, after sorting, contain 14%, a grade unattainable in this country.

The market for antimony has always been erratic. This is not the result of sudden fluctuations in consumption so much as because any metal that normally occurs in small detached orebodies is unattractive to capital; production therefore depends upon the occasional work of men who do not find it worth while to make it their exclusive business. This has been true of tungsten as well as of antimony. The discouragements incident to uncertain and unsteady output soon cause a decrease in deliveries until the market presently reveals that the demand has distanced the supply. The price and the output thus play a game of battledore and shuttlecock. The low prices before the War nearly extinguished the antimony industry in this country, because the unstable conditions previously mentioned disheartened the American miner, so that the dependence of the world for its supplies fell upon countries where a superabundance of low-priced labor was available. There may be more antimony in China than in the United States, but coolie labor is the controlling factor. Mr. C. Solomon Jr., a smelter of antimony, declared that a duty of $10 per ton would not prevent the Chinese from shipping it hither; he advocated a bounty of 3 cents per pound to the American miner, and 5 cents to the smelter, in order to encourage domestic production. It is well to point out, however, that the chief difficulty has been the uncertainty of a sustained price at a remunerative level; therefore no response in production comparable to the rise in quotations has taken place. The same is true regarding chrome and magnesite. A tariff sufficient to stimulate initiative in producing these metals in large quantities must needs be much higher than the duty requisite for sustaining such an output once it has begun. This emphasizes the urgent need of passing the War Minerals bill with the price-fixing authority retained. The Government is now protected against loss in accumulated stocks by the Act approved by the President on May 10 of this year. That disposes of one of the arguments offered by members of the House against a guarantee. It transpired, also, at the hearing on tungsten, that the activity of firms owned and controlled by Germans has been most pernicious in bottling up many of the tungsten mines of the country, the favorite scheme being to buy promising properties and keep them idle. German concerns, under the plea of pacifism, before we entered the War, bought all the tungsten that was offered them, and refused to re-sell, except under the obligation of old contracts. This was to save the souls of Englishmen from the sin of killing Germans! Such tactics helped materially to force the price to its abnormal height. Once again the Teuton miscalculated, for when tungstic acid finally rose to more than $100 per unit the resources of the country proved to be enormously greater than had been expected. It was impossible to corner the market. After we declared war all stocks were practically commandeered, including those in German-American warehouses, but restriction of the output was then attempted through acquiring ownership of the leading sources of supply. The War Minerals bill specially provides means for destroying this kind of obstruction by the Enemy.

Large deposits both of mercury and tungsten ore exist in the United States, and a suitable guarantee for the disposal of the product at a remunerative price, coupled with continuing protection under a tariff, would lead to exploitation on a scale great enough to ensure an output that would make us independent of importations from other countries. That seemed to be the sense of those who testified at the hearing, and it indicated the double requirement of passing the emergency War Minerals bill and of adopting a sane protective policy. At the present moment, as shown by Mr. J. H. Mackenzie, we are actually accumulating stocks of tungsten, but we must be careful not to draw false conclusions from that fact. We must remember that the richer deposits, by their very nature, are precarious, and also that the larger, low-grade, and more dependable resources, with few exceptions, remain untouched. In most cases where big low-grade deposits are left unexploited the cause is the same as that which retards the production of other minor metals, namely, the capital expenditure would be so large, whereas the persistence of remunerative prices through a period of years is so uncertain, that the provision for rapid amortization thus made necessary, coupled with high taxes, render expansive ventures too perilous for careful business men to undertake. The assurance of our supply of these minor metals depends primarily on the immediate enactment of the War Minerals bill.

The Production of Quicksilver and Tungsten

As Discussed Before the United States Tariff Commission at San Francisco

On June 26 the status of quicksilver in the United States was discussed at a public conference before the U. S. Tariff Commission. W. S. Culbertson presided, and Guy C. Riddell acted as metallurgical adviser. There were more than forty present, exclusive of officials.

The following table summarizes the output and prices during the past five years:

Year	Flasks	Average price per flask
1917	36,351	$98.29
1916	29,932	93.50
1915	21,033	81.52
1914	16,548	49.05
1913	20,213	40.23

H. W. Gould of the New Idria company represented most of the Californian producers and one in Texas. He viewed the post-war outlook with some concern if the present tariff is to apply. War-prices have stimulated prospecting and development in this country, although the principal increase in production is from the old mines. America cannot compete with the higher-grade ores and cheaper labor of Austria, Italy, and Spain, in normal times. The average cost of producing mercury in the United States is between $70 and $75 per flask. The Almaden mines in Spain yield mercury from ore averaging 11%, at a cost of $16 per flask. These deposits are owned by the Spanish government, but the output is contracted to the Rothschilds in London at £7 per flask. London has been considered the controlling market. The industry in Europe has been fostered by the governments. Metallurgical methods in Austria and Italy are efficient, but not so in Spain. The ore-reserves at Almaden are good for 40 years, on the basis of an output of 1000 tons of metal per annum. The cost in Austria and Italy will always be lower than in America, and those countries will be able to dump metal in America at less than $40 per flask. The ore deposits in California are small when compared with those in Europe. The main orebody at Almaden, Spain, carries 14%, and subsidiary orebodies 2½%. The average grade in California is 0.4%, equal to 8 lb. per ton of ore. The Italian content is about 1%; in Austria 0.85%. The Scott furnace is recovering 75% of the Californian output. Production after the War is likely to be much lower than before, owing to lower grades of ore being worked, these being about half as rich as in 1914, owing to the high prices. The New Idria and the Sulphurbank mines in California concentrate 300 tons daily each, but the losses are excessive. Mr. Gould sees no economic future for these properties. Mechanical concentration yields a product containing from 3 to 50% mercury. The recovery is as low as 50%. The costs at New Idria increased from $47.50 per flask in 1914 to $68 in 1917, covering an output of 11,000 flasks per year. The reserves of ore in the United States are not considered extensive. Labor costs account for 43% of the New Idria output, wages having increased 75% in three years. When the costs in California are compared with those in Europe—$75 here as against Spanish metal imported at $40 per flask—it is comprehensible why the producers suggest a duty of $35 per flask in addition to the present 10% ad valorem tariff to maintain the present American

MAP OF THE UNITED STATES SHOWING SITUATION OF QUICKSILVER DEPOSITS

output. The current price is $105, compared with $35 to $40 prior to the War.

Edmund Jussen, of the New Almaden mines, California, stated that his company handled ore from which 6 lb. was actually recovered, against 220 lb. in Spain. The geology at New Almaden, California, is similar to that at New Idria, and the costs are $90 per flask, based on the ore actually mined. The Cottrell precipitator is used to bring down the dust prior to the condensation of the mercury. The temperature of the gas passing through the Cottrell treater is too high to admit of condensing the metal. The Senator mine, of the New Almaden company, is 600 ft. deep, the old mine 2000 ft., and the New Idria 1200 ft. on the dip of the vein. The best incentive for the industry will be an assured price.

Clifford G. Dennis considered that the efficiency of labor at the two mines he supervised in California (the St. Johns) and Nevada (the Mercury) has decreased very little. Conditions at New Idria are more favorable than at other mines in this State. The average cost at all mercury mines in the United States over a period of five years was $50 per flask, indicating a loss of $15 per flask.

Murray Innes of the Oat Hill and Oceanic mines took issue with Mr. Gould regarding the question of ore-reserves, and thought the deposits in America extensive. If a fair price were assured for the metal we could keep up the output, otherwise Europe could flood the market. Mr. Innes thought the average ore in this State does not carry 8 lb. per ton. The future is uncertain, owing to the War. Metal sold to the Government by several producers has not been paid for in several months.

E. B. Crane of the Black Butte mine in Oregon considered that insufficient prospecting has been done to ensure the future output. In the case of his mine the suggested duty of $35 per flask would be too low. A new concentrating plant is now at work, recovering 85% from a soft disseminated ore carrying 4 lb. per ton.

H. C. Davey of the Guadalupe mine, California, thought that producers should enlarge their vision so as to consider consumers. The high-grade cheap-labor interests in Spain could dump metal here, and a tariff could not prevent it. The Spanish ore is evidently sorted up to the 14% previously cited. Owing to the pockety nature of the deposits, prospecting accounts for 75% of underground costs in America. There are large bodies of low-grade ore in California.

W. C. Crittenden, attorney for several quicksilver companies, took exception to statements concerning the quantity of ore available in this country. On account of the uncertain future no capital can be raised for developing prospects. When the War is over the demand for fulminate will drop considerably. Europe has increased its output, and a flood of cheap metal will threaten our market. A reasonable price for the metal is necessary to prevent this. E. de Golla of the Etna mine corroborated Mr. Crittenden's remarks.

George Roeth of the Great Eastern mine gave a résumé of quicksilver mining in California, stating that the average grade through many years was 0.5%.

C. E. Humbert of the Culver Baer Mining Co., Sonoma county, said that half of the men engaged in such operations are prospecting and half are mining. All the cost of looking for ore should be charged to mining. If the future were assured, capital might be interested.

Andrew Rocca of the Western Mercury Co., Sonoma county, considered that it was impracticable to charge capital with the cost of prospecting in the case of a quicksilver mine. There is plenty of ore here, but some protection is necessary. The grade in his mine is 10 lb. per ton. The total cost is $68.49 per flask, including depletion charges. Only the best ore is extracted on account of present conditions. At the Helen mine in Lake county, as low as 3 lb. per ton made ends meet.

C. W. Haas, selling agent for several Californian producers, said that there had been no imports for 18 months. (F. L. Ransome here interposed to say that a total of 710,000 lb. came from Mexico in 1916 and 1917.) His firm did import Spanish metal. There should be a duty put on the metal. When prices were high there were many offers from England, but when the price dropped these ceased.

Charles Bondies of the Study Butte Mining Co., Terlingua district, Texas, said that there were large deposits in Mexico.

Leslie Oliver, of the California Cap Co., a consumer, said that at present the consumption of mercury as fulminate is large, but substitutes are in use for detonators. The powder manufacturers are keen to have the production maintained. Substitutes for fulminate are effective, but they will not exclude mercury; they require some fulminate to detonate them, although they reduce the amount of fulminate required as much as 75%. Substitutes were so cheap prior to the War as to equal mercury at $41 per flask. No Ordnance Department, however, will accept substitutes for detonators in shells.

L. H. Duschak of the U. S. Bureau of Mines, who has been making a metallurgical investigation on mercury, said that a survey of the deposits in this country is under way. The present recovery in California is from 75 to 80%, but 90% is practicable. At Idria in Austria the recovery is about 90%. Fuel consumption in the Herreshoff furnace is 1½ times greater than in the Scott type; it makes more dust. The scope of concentration is limited, but furnace treatment will hold its own.

W. W. Bradley, of the California State Mining Bureau, gave excerpts from a new bulletin entitled 'Quicksilver Resources of California.' He exhibited a map of the State showing the quicksilver belts. From 1850 to 1917 a chart indicated three periods of large production —1861 to 1869, 1875 to 1883, and 1914 to 1918—concurrent with low prices, immediately following high prices. Normally the United States used 25,000 flasks per annum, against an output of 20,000 flasks, the difference consisting of imports. Half of the metal in peace time is used for fulminate. It is an essential metal at all times, and the industry should be fostered, protected, and maintained. There are undeveloped deposits in this State. The present duty of 10% ad valorem is not sufficient to protect the demostic industry. Spain is the greatest factor in the world's markets.

H. W. Gould added that the Santa Barbara mine, in the Huancavelica district of Peru, closed since 1789, is being re-opened by E. E. Fernandi of Lima. It produced 1,500,000 flasks up to 1790, this being more metal than any other mine in the world has yielded. It may be a factor in the market.

Murray Innes added, from conversation with H. C. Buckminster of the New Idria company, that there is practically no quicksilver in New York today. If it were not for the Government action in fixing the price for 40% of the output at $105, the present price would be $150 or more.

F. L. Ransome detailed the uses of mercury, namely, in drugs, electric apparatus, batteries, vermilion, amalgamation of gold and silver, measuring-instruments, paints for ship's bottoms, cosmetics, for floating lights in lighthouses, and in power-plants (a new use). Substitutes can be used in place of mercury, but their cost may be too high. An estimate of American requirements for 1918 is 36,166 flasks for all purposes. There are five producers in Texas, four being in the Terlingua district where the ore is considerably richer than in California, much being mined that yields 4%. Most of the high-grade ore now has been extracted.

G. McM. Ross gave some of his experiences in the use of quicksilver in the treatment of gold and silver ores. He did not favor a tariff, but a bounty on the metal.

Charles G. Yale, of the U. S. Geological Survey, said that the gold mines of America used 100,000 lb. of mercury per year in catching the metal, 45,000 lb. of which is used in California. The Kennedy mine at Jackson, with 100 stamps dropping, used only 1275 lb. last year, equal to about 0.007 lb. per ton of ore.

The hearing on tungsten was held on June 28. There were over thirty present.

Production in the United States has been as follows:

Year	Tons of 60% WO_3 in U. S.	Average price per unit
1908	671	$5.70
1909	1,619	6.30
1910	1,820	7.60
1911	1,334	5.90
1912	1,330	6.30
1913	1,537	7.30
1914	990	7.30
1915	2,332	15.40
1916	5,849	33.50
1917	4,800	20.80
1918	(estimated) 4,000 to 4,500	$16.00 to 26.00

J. H. Mackenzie, at one time connected with the Atolia Mining Co. in California, said that the production of tungsten in 1918 would be less than in 1917 and the imports would be greater. For the first four months of 1918 the receipts were 2382 tons of 60% concentrate. Some of the imported materials is impure, but it commands a ready sale. The imports come chiefly from the Orient, Mexico, Portugal, and Bolivia. The last-named deposits are from placers and lodes in the mountains. In 1917, 4880 short tons was imported. Portugal produces 3000 tons per year. That country has fixed the price at about the same as the present American prices, namely, $20 to $24 per unit. Some Korean mines produce tungsten as a by-product [notably the Soctarie mine of the Seoul Mining Co.—EDITOR.] Prior to the War the United States used little tungsten. Atolia formerly shipped concentrate to Germany. Mr. Mackenzie attributes the drop in output to the drop in price due to accumulated stocks. The ferro-tungsten stocks of 16 consumers on May 1, 1917, were 517,572 lb.; a year later they were 545,575 lb.; ore and concentrate, 1,134,379 lb., and a year later 2,370,219 lb. was in stock; high-speed steel stocks in May 1917 were 3,555,257 lb., and a year later 5,269,958. Reducing all to a 60% basis 3,690,720 lb. was on hand May 1, 1917, and 5,757,640 lb. a year later. Between 900 and 1000 tons of concentrate was in Eastern warehouses on May 1, 1918. His opinion is

MAP OF THE UNITED STATES SHOWING SITUATION OF TUNGSTEN DEPOSITS

that there will not be much change in the market this year. Consumers' wants for 1918 are 11,575 short tons of 60% WO_3. The newest use of the metal is for aeroplane engine-valves, containing 4 to 10% tungsten, employed in the steel valves and seatings; it makes them wear better. A number of producers stated that it was a matter of price alone that would increase the output. At least $35 per unit was necessary for this. The American deposits contain substantial tonnages of 0.5 to 0.75% ore, too low at present prices to interest capital. Colorado has no large deposits of low-grade ore, that is, below 1%. The highest grade being mined by the Atolia company is between 2 and 8% ore. This mine is worked to a vertical depth of 500 ft. This is not considered a big resource, as the bottom levels do not look so well as the upper. The future output of this country will come from California and Nevada. The Nevadan ores carry from 1 to 3%; those near Bishop, California, about 1%. The cost per unit of 60% concentrate in Colorado is twice that of California and Nevada. The peculiar mining necessary is responsible for this. The operating cost at Atolia is about $8 per unit. The total cost of the Bolivian product is $15.75 per unit, laid down at New York; and $11.60 from China. No Burma ore comes to America at present. That country, Bolivia, and America produce similar quantities. The Burma cost is $12.25 per unit. The world's consumption of tungsten is 21,000 tons, and the reserves are probably not more than this total, that is, assured. The British and French governments are trying to arrange with the United States to allocate the world's output, for the period of the War, but the terms have not been settled by this country. None of the Allied countries find molybdenum satisfactory as a substitute for tungsten in steel, although the Germans must be using it. The average recovery of tungsten by concentration is 75%. Stage-crushing and more careful classification will help to improve this. Tungsten minerals are not amenable to flotation.

W. W. Bradley of the California State Mining Bureau gave a list of the known tungsten prospects and producers in this State. Californian production has been as under:

Year	Tons	Value
1917	2,458	$3,068,331
1916	2,270	4,571,521
1915	962	1,005,467
1914	....	180,575
1913	....	234,673

Inyo, Kern, Nevada, and San Bernardino are the producing counties. The last is the richest, on account of the Atolia mine, which accounts for 50% of the State's total. The Inyo County deposits may be called disseminated; the ore carries under 1%. Four mills are at work near Bishop. Apart from Atolia and Bishop, the output of California is from small mines. Losses in slime are probably responsible for the present low recovery. The possibilities of finding ore in this State are good, provided the market remains favorable.

F. L. Ransome gave Mr. Hess' figures of cost as $6 per unit at Atolia, $10 at Bishop, $5 near Toulon, Nevada, and $20 at Boulder, Colorado. G. B. Ackerman gave some information on the Nevada deposits. Costs near Sodaville have been $5 per ton. This was in mining high-grade scheelite. Mineral and Humboldt counties contain big deposits. Production in Nevada fell-off after the price receded from $40 per unit. In 1915 the output of Nevada was 55 tons, and 689 tons in 1916. Joe Beane, who had knowledge of the property at Sodaville, stated that it is costing $16.85 per unit at the present time. The ore averages 4.2% tungstic oxide.

Samuel Kahn, representing H. M. Byllesby & Co. of Chicago, said that his firm became interested in a mine near Lovelock, Nevada, in 1916. They are concentrating custom ore from the region, including the Mill City district. His firm considers that a higher price would stimulate production in this district.

F. W. Griffin, of the Tungsten Mines Co., considers that the future of the industry lies in the low-grade ores. His company at Bishop, California, is milling 0.5% ore. If a price of $28 to $30 were assured for some years, production should be maintained. The tariff should be arranged toward this end. Freight on concentrate to the East is $35 per ton, plus the recently increased rate.

P. J. Osdick, producer at Atolia and president of the Rand Mining District Association, read a statement prepared by this Association. The stabilizing of the market, the elimination of middlemen or dealers, and the licensing of buyers, samplers, assayers, etc., is desired. The production of the Rand-Atolia district has declined since July 1917. Only $20 per unit is offered by the one buyer in the district. Martin Conroy interposed here, explaining that the local assayers gave a lower return than assayers in other centres. Between the broker and assayer the small miner did not receive his full value, he being at the mercy of these dealers, whose Eastern connections are not known. A great deal of leasing is done in this district, the leases being on a royalty basis from 15 to 50%. The two companies that had a regular output received several dollars per unit more than did the lessees. Waldemar Schmidt explained that royalties are on both a cash basis and on a sliding scale, depending on the price of the metal. He also said that the Atlas Crucible Steel Co., of Dunkirk, New York, eventually gets the product of the small mines.

R. A. Kinzie of the Tungsten Mines Co., Bishop, California, considered that the local deposits were larger than those in San Bernardino county. The future of the industry, as in other metals, depends on the low-grade formations. Near Bishop they are garnetiferous and are the lowest grade in the world. The Tungsten Mines, Standard Tungsten, and Round Valley companies are mining similar ore. The deposits do not persist; so far nothing was found below a depth of 260 ft. The cost at Bishop is $21.80 per unit, including operation, capital, interest, and depreciation. A fair depreciation charge for a tungsten mine is 50%. Joseph Beane stated, in support of this, that several companies that had spent up to $375,000 in Nevada had suspended work in less than a year. The cost at Bishop is between $5 and $6 per ton of ore milled. A preferred price would be $25 to $30 per unit.

The War-Minerals Bill

Testimony of WALTER R. INGALLS, Editor of the 'Engineering & Mining Journal', Before the Committee on Mines of the House of Representatives

MR. INGALLS: Mr. Chairman, I have been asked to come down here and express my opinion about this bill. As I understand it, the prime purpose of the bill is to increase the supply of certain minerals, but more especially the manganese ore, pyrite, and chrome ore. The bill enumerates many other mineral substances of which the production is already at the maximum and whereof we have a surplus. For example, it enumerates the metal antimony, which at the present time is in the same depressed condition that are lead, zinc, and many of the major minerals. The production of other minerals that are included in this enumeration has already been so stimulated that we can say today that there is a superfluity rather than a deficiency.

There are other minerals mentioned in the list whereof it is extremely doubtful whether we can do anything whatever to increase the production in this country. Take, for example, tin. I understand that in the original draft of this bill it was contemplated to include copper, zinc, lead, and other major minerals which have since been excluded. I do not think the phraseology of this bill does exclude them. The bill speaks of the ores of arsenic and the ores of sulphur, for example, and our ores of copper are frequently ores of arsenic, and our ores of zinc are very largely ores of sulphur. So, if you think that in the first paragraph of this bill you are excluding zinc, copper, and lead, and perhaps even gold and silver, do not be too sure of that.

THE CHAIRMAN: Do you not think it would only be by a stretch of imagination that you could get that interpretation in this bill?

MR. INGALLS: Most distinctly, yes. Our zinc ores, for example, are regularly ores of sulphur.

THE CHAIRMAN: Do you call a mine where zinc and copper are being mined as the principal ore with a by-product some other kind of ore, or do you call them zinc and copper mines?

MR. INGALLS: We call them zinc and copper mines.

THE CHAIRMAN: Of course, we do not want to include them here.

MR. INGALLS: We commonly designate mines by the predominant mineral, but there is scarcely an important mine in this country which does not produce many substances from the same ore.

THE CHAIRMAN: Certainly, that is true. But are they known in mining law or in ordinary mining understanding, and in common usage and technical usage, or any other kind of usage—they would not be called ores in this particular mine, would they? Of course, you might find a little mixture of that kind in any ore you get out, and probably in some you would find them as by-products; but would it be your opinion that they would be included under the terms of this bill?

MR. INGALLS: I think they might. I think it would be desirable to make your language so specific that they would not be included.

THE CHAIRMAN: Of course, we do not want them to be.

MR. EVERETT SANDERS: Would you suggest that we include by specific terms copper, zinc, lead, gold or silver, or anything of that sort?

MR. INGALLS: I do not think we need any help at this time in the gold or silver mining or lead mining.

MR. SANDERS: But, considering the proposition from a technical standpoint, do you think the section ought to exclude certain of those things in order to make it perfectly clear that they were meant to be included?

MR. INGALLS: I do.

MR. COURTNEY W. HAMLIN: Do you think that by the use of the expression here that arsenic would, by any reasonable interpretation, be included in the mining of copper?

MR. INGALLS: We have a large production of arsenic in this country. We do not need to do anything to increase that production. I do not know of a single pound of arsenic, however, that is obtained from any ore except copper.

MR. OTIS WINGO: Your idea is that if we provide for control over arsenic in order to exercise that control completely we would have to take control of the copper mine from which you would get it? Is that your idea?

MR. INGALLS: You certainly would.

THE CHAIRMAN: Let me call your attention to this proposition: That does not necessarily mean if you have a super-abundance of arsenic in this country being produced that the Government would do anything except possibly look out for its distribution, and so on; that the Government would not go in and mine arsenic when there was a super-abundance of it being produced.

MR. INGALLS: I should hope not.

MR. WINGO: Would you think this, that the question of control of the arsenic lies in the State? I am not familiar with those things, but for illustration, let us say, that arsenic was being used in steel production, and we had undertaken to control the price of steel. Do you not think it would be a matter of fairness in order to stabilize the market so that these people would have some assurance as to what the prices of these different materials that enter into that production will be? Would that be a proper and a fair thing to do?

MR. INGALLS: I do not think we need any stabilizing of the market. I think that efforts in that direction are

more likely to be mischievous than otherwise.

MR. WINGO: You do not believe in price fixing?

MR. INGALLS: Absolutely not.

MR. HAMLIN: Am I correct in saying that arsenic is a by-product of copper?

MR. INGALLS: Of copper ores.

MR. HAMLIN: You say if we control the production of arsenic we would have to control the copper mines.

MR. INGALLS: I do not see how else you could do it.

MR. HAMLIN: Suppose the Government would take control of oleomargarine. You do not mean that that would give them the power to control the whole cattle industry, from the farm up on through to the packers?

MR. INGALLS: I wish you would cite some analogy which is more in my line.

MR. HAMLIN: Oleomargarine is a by-product of the cattle business; you know that?

MR. INGALLS: Yes.

MR. HAMLIN: If we were to undertake to control——

MR. SANDERS: I do not think oleomargarine is a by-product of the cattle business.

MR. HAMLIN: Is not oleomargarine a by-product of the cattle business? What is it made of?

MR. SANDERS: It is made out of a great many things.

MR. HAMLIN: It is a by-product of the steer, is it not? Is that not a fact?

MR. INGALLS: I do not know about that.

MR. HAMLIN: I understand that oleomargarine, a substitute for butter, and the very best quality we can get, is made from certain portions of the beef and is manufactured by the packers at Chicago and everywhere else. The point I want to get at is this: Is it not true that while arsenic may be extracted from copper ores, that is done only in negligible quantities; that is, compared to the principal amount of copper produced?

MR. INGALLS: It is relatively small.

MR. HAMLIN: Negligible.

MR. INGALLS: Relatively small.

MR. W. FRANK JAMES: Let us take Mr. Douglas, for instance, who is the president of a company owning and operating a copper mine. Do you think because they manufacture some arsenic that this bill is so broad that under its terms the Government would control his entire output of copper unless there was some amendment made?

MR. INGALLS: I think that the mine administration, under that authority, might step in and attempt to control the whole output.

MR. JAMES: You think it would not only control the market on arsenic, but his entire copper product?

MR. INGALLS: They probably would not undertake to control the price of the copper output, but they might indirectly undertake to control the way he was doing his business.

MR. JAMES: Do you mean to say that in order to get some arsenic they have to go down there and take control of his copper mine and run his business, and then turn it back to him again.

MR. INGALLS: It seems to me that is true.

MR. JAMES: You do not think that is the intent of the bill, do you?

MR. INGALLS: I do not think it is.

MR. HAMLIN: What proportion of the arsenic that we use do we produce in this country?

MR. INGALLS: The production is possibly 4000 or 5000 tons a year.

MR. HAMLIN: What percentage of that which we consume do we produce in this country now?

MR. INGALLS: I think we produce all our arsenic. I think there is a capacity to produce a superfluity of arsenic.

MR. E. S. BASTIN: The production is about 60% of the consumption at the present time. My understanding is that we are not self-sufficient at the present time, but that, however, if a contemplated smelter is built by the Anaconda Copper Co. we are likely soon to become so.

MR. HAMLIN: About 60% now?

MR. BASTIN: Yes, sir.

MR. INGALLS: You are talking about a smelter being contemplated by the Anaconda Copper Company.

MR. BASTIN: I understand they are building a plant to recover arsenic, or that they have plans drawn up for a plant which will yield an output that will practically make us independent, but that we are not now independent.

MR. INGALLS: Very likely that is so. The Anaconda Copper Co. has been the largest producer of arsenic for years, and if our production has lately been insufficient, the Anaconda Copper Co. has stepped into the breach and supplied it. Our raw materials for the production of arsenic are probably superfluous.

MR. HAMLIN: What is the relative production of arsenic and copper in this country?

MR. INGALLS: The production of arsenic to copper is a mere speck. I suppose that the annual production of arsenic is in the neighborhood of 5000 or 6000 tons a year, while our production of copper last year was 1,800,000,000 pounds.

MR. HAMLIN: So the amount of arsenic, as compared with the amount of copper, is quite negligible.

MR. INGALLS: A mere speck. Then, in the matter of investigation as a means of increasing the production and eliminating wastes in tin and in tin scrap and other things, I do not think that this bill confers one particle of authority in addition to what is already being exercised by bureaus of the Government. In the matter of commandeering supplies when necessary, the Government is already doing that. We do not need to have any more authority. Coming back to the main purpose of the bill, the increase in the production of manganese ores, pyrites, and chrome ores, the production of those ores is already being stimulated feverishly under the influence of high prices. Our production is increasing every month by leaps and bounds. It may be necessary to do more. Some of our friends say it is, and I will not dispute that proposition. Please understand I am not opposing the purposes of the bill. But if that is the purpose, why not go directly at it and say that we hereby appropriate to

the Secretary of the Interior the sum of $50,000,000 with which to go and get manganese and pyrites. It seems to me that what is in mind in the bill is excellently illustrated by the case of chrome, which we get substantially from nowhere except in California. In California there are numerous small deposits which have been worked, and the effect of increasing production so long as they are reasonably near the railroad might be good. In order to increase the production of chrome ore it is necessary to go to more remote deposits and build in there branch lines of railways or highways for bringing out the ore, which it is represented that private capital is unwilling to do because of the uncertainty of the market. Very well, then, let the Government, through the Secretary of the Interior, or any other proper medium, back those people for that specific purpose. But why guarantee a price to everybody, including those who are already working their mines at a profit? Let them alone.

THE CHAIRMAN: Do you think it will be the intention of this bill, or anybody who was administering it, to guarantee a price to the people who are supplying sufficient quantities of these ores at proper prices which might be discovered after an investigation by the bureau?

MR. INGALLS: How else are you going to do it?

THE CHAIRMAN: If you say they are already receiving a profit and they are working their mines to the fullest capacity and getting plenty of ore out of them, do you think the Government would do that?

MR. INGALLS: I should hope not.

THE CHAIRMAN: I would say I would not be for the bill if I thought they were going to do that. Nobody connected with this committee or with the Government imagines for a moment that such a thing would be done.

MR. INGALLS: It seems to me that this bill has got to be fixed in order to take care of that.

THE CHAIRMAN: We have got to trust men with some judgment and common sense in those things when it comes to a matter of that kind. Certainly we have more confidence in the Government than to believe that the Government officials would do such foolish things as that. Do you not think so?

MR. HAMLIN: What mineral mentioned in this bill is now being produced in sufficient quantity with a prospect of being able to meet the increased demand occasioned by the War? Will you please name those you think are in that category?

MR. INGALLS: So far as antimony is concerned, our main supply comes from China.

MR. HAMLIN: I do not think you understand my question. I got the idea from your statement that we had included in this bill certain minerals that are produced in this country in sufficient quantities to meet the present demands, with a prospect of meeting future demands, at a profit. I asked you to name those and not to name those which are not produced in this country.

MR. INGALLS: We are producing sufficient arsenic; we are producing sufficient magnesite; we are producing sufficient mercury; we are producing sufficient molybdenum; we are producing sufficient tungsten.

MR. HAMLIN: And you think the prospects are good enough so that we can trust to the future for the supply of any increased demands that may come upon these mines, that they will be able to meet them?

MR. INGALLS: I do not see any necessity for interfering with those mines, either with assistance or by restraining language.

MR. MAHLON M. GARLAND: It was explained here by some one that it was necessary to increase the output because of the fact that we have to supply our Allies, and also that it is necessary to relieve the ships that are carrying that stuff from China now, but that the more special need is to supply our Allies, and that while we were getting enough for this country the demands for these things by our Allies are increasing.

MR. INGALLS: The use and importation of many of these minerals is a very small tonnage business. In this whole list the only big tonnage imports are those of manganese ores and pyrites.

While it is true that the bulk of our antimony comes from China, the total use of antimony is but a relatively few tons, and it is heavy freight, and it comes in ships that are bringing light shipments, and it is very questionable whether the exclusion of such a small tonnage would really accomplish anything. How much money ought we to spend in this country to develop very lean and poor antimony mines in order to save the bringing in of a very few tons of antimony from China, which would probably come along in a ship that is bringing something else anyway?

MR. WINGO: Suppose we were to put an embargo on those light Chinese things we do not need in this country and which are now being brought over in ships on which our antimony comes, and that it is desired to save all of that shipping. As I understand it, the rule now is that 1 ton of ore can make way for about 5 tons of food. As I understand it, that is what they figure on. What would you do in order to make up the deficit in any of these different metals which are necessary, even though they may be necessary only in a small amount; how would you go about doing that?

MR. INGALLS: I should say in the first place that the premise is impossible. We could not put embargoes on everything. We could not put an embargo on tin, because we would not get any tin.

MR. WINGO: I said we might put an embargo on the light things coming from China, which you mentioned and which are unnecessary. Evidently we get a great deal of stuff from China which we do not need now, and the need for ships is so great that if an embargo has not been placed on them it should be. Suppose we eliminate all that stuff, and we find that the need for ships is so great upon the Atlantic coast that they find it necessary to take the ships which have been bringing that unnecessary stuff across the Pacific and bring them around to the Atlantic coast for the purpose of furnishing supplies to our Allies and to our own men. Then practically all of the supply of antimony that has been used to meet domestic needs in this country would be thus

shut off, and we would be shut off from the supply we got from abroad?

MR. INGALLS: If you are going to do that, the only thing you could do would be to work our lean mines and get what you could from them, regardless of the expense.

MR. WINGO: Could not you develop new antimony deposits or develop some that are already known of and are undeveloped?

MR. INGALLS: Before the War the normal average price for antimony was in the neighborhood of 8 cents a pound. At the present time the market price is a little over 12 cents a pound. Although that, in figures, is a high price, relatively it is a low price, because it simply measures the expansion that we have had in everything. In the early days of the War antimony rose to something like 45 cents a pound. For long periods of time it was up in the forties, and it failed to stimulate our antimony production.

MR. WINGO: Did it not open up any new mines?

MR. INGALLS: Not to speak of.

MR. WINGO: What do you mean when you say "not to speak of"? Did it open any that you know of?

MR. INGALLS: I think that during that period the old mines in Arkansas were operated spasmodically, but there were no antimony mines in this country operated sufficiently to make any material production.

MR. WINGO: Where was it in Arkansas where they had old mines which had been worked prior to that time, and what deposits were there that had ever been worked before the War?

MR. INGALLS: I cannot tell you the names, but there are some old antimony mines in Arkansas.

MR. WINGO: Old antimony deposits that have been incorporated and driven down to demonstrate that the antimony was there; but was there ever any ore shipped in commercial quantities from Arkansas prior to the War?

MR. INGALLS: I think so.

MR. WINGO: Why do you say it is impossible for us to put an embargo upon non-essentials? If it is necessary to put an embargo upon the ores we are getting from China, why do you say it is impossible for us to put an embargo on these other things in order to save the shipping for foods and supplies to our Allies and our men, and then by that very process encourage the opening up of old mines, as you suggested, and new, undeveloped deposits? Why do you say it is impossible for us to do that? You said it was impossible.

MR. INGALLS: I said it was impossible to put a general embargo on those things, which was your proposition.

MR. WINGO: I did not say general embargo. I said a special embargo on these unnecessary things. Why is that impossible? Are we not doing that very thing now? Has not the President of the United States put an embargo on various things? Have you not overlooked the fact that the prime purpose is to save ships which are now being used to carry such things as these light unnecessary things which come from China? In order to encourage the opening up of undeveloped deposits of such things ought we not encourage capital to go in and develop them and not let it be left broke by a sudden and unexpected cessation of the War?

MR. INGALLS: You make it a business proposition. The question is whether it is better to save one ship or two and use the labor of many hundreds of men and much material in order to get something out of an uneconomical proposition.

MR. GARLAND: Take the case of pyrites. As I understood it from the statements that have been made here, it requires 5 ships to bring the pyrites we use in this country now from Spain. Is there any way of relieving that? Pyrites are very cheap, as a rule, and there are a great many mines in this country, are there not? Are we doing anything in the way of developing pyrites mines now?

MR. INGALLS: Yes.

MR. GARLAND: Are they able to mine pyrites at a profit at the present time?

MR. INGALLS: The prices are high. The stimulus of high prices is increasing the production of pyrites. We have also other means of increasing our production of sulphuric acid, namely, through the wider use of zinc blend, and even through the use of brimstone. Mind you, Mr. Chairman and gentlemen, I am not opposing the principle of this bill, or the desire to increase the production of these minerals and metals by a governmental subsidy or bonus. I do advise that the bill say more specifically what it aims at, and create more specifically an authorization to the Secretary of the Interior, or some bureau of the Government, to go out and get these things, as would be done in business, and so let our industry, that is well able to take care of itself, let that part of our industry alone.

MR. GARLAND: I see your point there, as you have stated it. I mentioned pyrites because it was stated here that we could save a large tonnage by getting it in this country. We are now getting pyrites at a price that recompenses those producing it in this country, but not enough of it. Your idea would be that if there is a pyrite mine located where that stuff can be secured, but which is a long distance from a railroad, that the Government should step in and build a road instead of raising the price or guaranteeing the price for that mineral.

MR. INGALLS: Yes.

MR. GARLAND: It seems to me that looks reasonable, too.

MR. INGALLS: If the Government wants to do that.

MR. GARLAND: If they want the pyrites, they would have to.

MR. INGALLS: The normal increase in the market price, the advance in the market price, has automatically increased the production of these substances, and at the same time it has curtailed the consumption of things that are unnecessary. Take, for example, the matter of chrome ore—the advance in price and the increased production of chrome ore. At the same time it has or will decrease the use of chrome ore for refractory material.

BUTTE, MONTANA, WHICH IS PRODUCING AN ESSENTIAL METAL

IN THE HEART OF THE MOUNTAINS, WHERE WAR MINERALS ARE FOUND

It will give an available supply of chrome ore for the manufacturers of ferrous alloys and ferrous chrome, and for the people who are now using them for refractory material, and they can also use magnesite, of which we have an ample supply. Magnesite serves quite as well for their purposes, and there is a point in the price where they will do it.

MR. GARLAND: The point made by gentlemen who appeared here on the first and second days of these hearings was that it was necessary to speed this matter up; that it is absolutely necessary to do this at once; and that they cannot wait for the development in the manner in which you speak, and therefore the necessity of this bill.

MR. INGALLS: Very well. Simply say to the Secretary of the Interior—I speak of the Secretary of the Interior because I agree with my friend Mr. Douglas that the industry has confidence in the Secretary of the Interior and his bureaus, and we do not have confidence in commissions that are stepping in to take a part in our industry—say to the Secretary of the Interior, "Here is $50,000,000, and with that go out and get manganese or pyrites or chrome ore in any way you see fit, because we want it in a hurry."

MR. GARLAND: I see the point you are making.

MR. HAMLIN: Then suppose the producers would get together and say to the Government, "You will have to pay us a certain price," which was an unconscionable price, "because you cannot get it anywhere else." Then you would leave the Secretary of the Interior at the mercy of the producers when he comes to expend that $50,000,000. What are you going to say then?

MR. INGALLS: You contemplate the organization of a combination?

MR. HAMLIN: I contemplate that that is within the range of possibility under that scheme, and I also contemplate that without this law or some similar provision these sources that are now producing quite sufficient quantities of certain of these vital necessities might do that for the purpose of enhancing the price or reducing the amount of production so as to create an artificial demand. That is within the range of possibility. It has been done before, and, unfortunately, we have some people who might do it again.

MR. INGALLS: We are conducting a very great mining industry. These matters of manganese ore and chrome ore are very important, but in comparative magnitude with other branches of our mining industry they are relatively insignificant. I have not observed any desire or any effort on the part of anybody to hold up the Government. On the contrary, my own observation has been that everybody is patriotic and that everybody is competitive, and I cannot conceive that anyone who had a production of manganese ore would fail to sell it as quickly as he could at the going price.

MR. HAMLIN: Let us hope that is true. But do you not think that in these times of national stress and peril it is the part of wisdom and statemanship to do everything that is necessary to be done to be able to control any situation that might arise, and if these parties are patriotic, as we all hope they are and as we have every reason to believe they are, they could not and would not complain at any Government restrictions or control?

MR. INGALLS: If that condition arises, the President would simply step in and commandeer the supply, as he has already, through the various departments, commandeered supplies of other needed substances.

MR. HAMLIN: That is just like surgery. We prefer to apply the less heroic remedies, unless it becomes necessary to perform a capital operation, and this bill seeks to provide a way so that it may be less disturbing to the business interests of the country by regulating it, and then everybody will understand how to take it and it will not be necessary to resort to radical measures.

MR. WINGO: Is not this the trouble, that we have been following your plan for 12 months, and I do not suppose anybody is satisfied with the progress that has been made. Is not this one of the measures by which we can proceed to do directly what we want to do and speed up things and get what we want right now and go ahead and win the War?

MR. INGALLS: There has not been the stimulus of high prices in connection with these particular things until quite recently.

MR. WINGO: In some instances there have been some cases, in extreme instances, where the Government has not gotten much help, except in the way of depleting the Treasury. But I think all industries ought to remember this, that we cannot shut out privateers altogether. The fact is that we have not gotten to the point where we have a sufficient supply in this country and must shut off all the tonnage which is used in importing that stuff, so that we can use that tonnage in carrying the most important things to Europe. Is not that the practical thing, and can we meet that by an academic eulogy of the thing which I admire as much as you do, and that is the law of supply and demand. I have very great respect for the law of supply and demand. I am a great believer in that myself, but we have reached the point where our customary economic theories fail, and so is it not our duty to try something else to see if we cannot get better results?

MR. INGALLS: My observation has been that our customary economic theories have not failed.

MR. HAMLIN: It is a very serious situation, which from all reports seems to be confronting us now, so far as our shipping goes. You realize that, do you not?

MR. INGALLS: Surely.

MR. GARLAND: I would like to have the gentleman go on and state what he would further advise along those lines, by way of amendment of the provisions we have in the bill which is before us.

MR. WINGO: That is the point I was trying to get at. You are a practical man and we want to have the benefit of your suggestions. If this is a plan that is unnecessary and that will not work, tell us some other plan that will help to speed up the matter and save the shipping.

MR. INGALLS: I should say as a practical plan that the best method would be to create a United States Mining Corporation, with all the capital stock owned by the

United States Government, with sufficient capital to accomplish the purpose that is desired, and, in general, instructions should go out to increase the production of manganese and pyrites and to go out and get that. If it were not desired to do that I should say simply appropriate for the use of the Secretary of the Interior the sum of $50,000,000, or whatever is deemed desirable, with the simple instructions to go out and get these minerals.

MR. JAMES: At what price?

MR. INGALLS: In any way he can. If you want a thing very badly, the price does not cut much figure.

THE CHAIRMAN: That would require commandeering to get that stuff, would it not?

MR. INGALLS: I do not see why it would require commandeering. It would simply be an ordinary business method.

THE CHAIRMAN: You mean you would send the Secretary of the Interior out with $50,000,000, send him out throughout the country to buy the necessary war materials?

MR. HAMLIN: At any price?

THE CHAIRMAN: At any price.

MR. INGALLS: I would send him out to get the materials in any way he could get them.

MR. HAMLIN: At any price he sees fit to pay?

MR. INGALLS: At any price he sees fit to pay.

THE CHAIRMAN: If they asked him $2 for a pound of an article which was ordinarily worth only 50 cents, he would pay that amount; is that your idea?

MR. INGALLS: I assume he would be properly advised.

THE CHAIRMAN: But he would have to buy it. You said you would not commandeer it, but you would buy it. You could not take a man's property under your plan. If you go to him and say, "I want so many pounds of pyrites," and he had it, and he said, "I will not sell it to you except at a certain price," the Government would have no power to get it except by paying the price he asked for it. Do you not think the Government in that case ought to have some right to fix the price, which would be reasonable and afford the man who was mining the mineral a reasonable profit?

MR. INGALLS: It seems to me the natural competition among producers would give the Government the material.

MR. WINGO: Let us assume that we have shut off the imports in order to save the shipping. Then suppose a man would say, "I want to help you, but I cannot afford to go into this thing, to put in money for improvement and take a chance on the War stopping suddenly. I would like to get my capital back, but under your proposition I would not get my capital back and would not get a reasonable return for the capital, considering the time it had been used." Do you think it would be a practical thing for the Government to do that, and do you think you would get the results? Do you think that men would feel that their patriotism required them to take that chance and to do that thing? Would not the Government get better results if we were to say, "We do not ask you to risk anything, but if you will put in the money necessary to open these deposits, we will guarantee you such a price for a certain length of time, and it will be a safe venture for you, and you can start at it without risking your fortune and everything you have in it."

MR. INGALLS: I suppose we could do that by contract.

MR. WINGO: Is not that what this bill practically does? We say to the Secretary of the Interior, "Here is $50,000,000. You go out and encourage the opening up of these deposits in this country and guarantee such a price for such a length of time that will make it an attractive proposition," and would not that encourage the very sort of thing you are talking about and encourage the sort of men you are referring to? Is not that what the bill proposes to do in a practical, direct way?

MR. INGALLS: I think that is what you have in mind.

MR. WINGO: That is what I want to get at.

MR. INGALLS: I think that is all right, but what I would like to see would be for you to protect that part of the industry that can take care of itself and do not give anybody the right to come in and interfere with things.

MR. WINGO: I beg your pardon. I think you said you would be in favor of taking over the project.

MR. INGALLS: No.

MR. WINGO: I thought you wanted to organize a United States mining corporation to go into the general business.

MR. INGALLS: I would have that corporation go into business as anybody else.

MR. WINGO: Do you not think that a United States mining corporation, organized with $50,000,000 of stock, would have a negative or depressing effect upon private producers? Does not a large corporation of that kind always depress the smaller man and make him more cautious in his investments? Can you conceive of a more powerful corporation than a United States Government mining corporation, clothed with all the powers of the Government back of it?

MR. INGALLS: I do think it would be a good business for the Government; I do not believe there would be any profiteering by anybody.

MR. WINGO: Certainly not, if you have socialism in this country. If you had that, you would shut out profiteering, except profiteering in controlling the Government. We would be trying to be directors of the governmental corporation. Is not the practical thing now to encourage the development of this stuff so that men will go out and get it and bring it to the Government? If that is the thing to do, and if we have not done it, what language would you suggest by way of change in this bill to make it more practical?

MR. INGALLS: I would change that language that gives anybody the right to interfere with a mining business that is being efficiently conducted at the present time by its private owners.

THE CHAIRMAN: Will you please point out where that is done in this bill?

MR. NATHAN L. STRONG: As I understand it, your criticism of this bill grows out of the conception that it is proposed to stabilize the general market rather than to render aid to the individual.

MR. INGALLS: I understand it so.

MR. GARLAND: Why would it not be proper if you make an increased price for any article to have all of them participate in it?

MR. STRONG: I interpret your idea that way.

MR. INGALLS: I am under that impression.

MR. WINGO: Do you think it is more practical for the Government to build a railroad for the benefit of this producer than to make a contract with a man and say it will take a sufficient amount of this stuff—say that it will take a certain amount of this material at a certain contract price for a certain number of years that will justify the man in making this expenditure, or do you think it would be better for the Government to build a railroad for him? Then, what would you do with the railroad, give it to him? Or would the Government operate the railroad when the necessity for it passes?

MR. INGALLS: It would come to the same thing.

MR. JAMES: Suppose the price of copper was not a sufficient price to make up the expenses? Would it not be better for the Government to guarantee a price to the copper miners than to take an undeveloped property and run a railroad from the mines and let properties already developed lie ilde?

MR. INGALLS: I have no doubt that if the Government would let things alone we would have plenty of copper and everything else.

THE CHAIRMAN: Right on that line, we have not plenty of these articles now in our own country, have we? We are not producing them?

MR. INGALLS: We have not right now sufficient manganese, sufficient pyrites, or sufficient chrome ore. This is an emergency that has come on within a few months.

THE CHAIRMAN: That is what we have to meet, this emergency that is on us.

MR. INGALLS: You have to meet this emergency. The stimulus of high prices will help you meet the emergency.

THE CHAIRMAN: Supposing shipping is interfered with between here and Spain, or between the United States and the point where we get our manganese, as it is now being interfered with, and the need for ships is so great for the purposes of carrying food and other supplies to Europe, so that we are deprived of those articles that are necessary. The emergency is here; what are we going to do about it?

MR. INGALLS: What is anybody going to do?

MR. CHAIRMAN: We are going to try to meet it by provisions of this bill.

MR. INGALLS: Private capital is already trying to meet it.

THE CHAIRMAN: But they have not yet met it.

MR. INGALLS: They are further on the way to meet it than anything which will be done under this bill.

MR. WINGO: Would this bill accelerate or retard their efforts?

MR. INGALLS: I should say it would do neither.

MR. HAMLIN: Then it will not harm anything?

MR. WINGO: You think it is a harmless piece of legislation, then?

MR. INGALLS: So long as the Government does not interfere with our industries and they are being successfully prosecuted, it is immaterial and it is harmless. It may be helpful.

THE CHAIRMAN: Will you point out where this bill would interfere, if you please? We would like to know that.

MR. HAMLIN: Is it not the licensing feature of this bill which you most object to?

MR. INGALLS: That is one feature.

MR. HAMLIN: Is not that your real objection?

MR. INGALLS: The bill is full of—

MR. HAMLIN (interposing): Regulatory provisions?

MR. INGALLS: Regulatory provisions of that character which afford some new commission authorization to come in and interfere.

THE CHAIRMAN: Let me ask you this question: Do you believe in war time that everybody ought to be turned loose to do just as he pleases, or has the Government the right to come in and regulate the absolute necessities in war times?

MR. INGALLS: The Government has an absolute right.

THE CHAIRMAN: Do you think they ought to do that as a matter of safety for the country and for the successful prosecution of the War, or ought everybody to be turned loose to do as they please?

MR. INGALLS: I am afraid that some of the things the Government has done in the way of regulating, with special reference to our industry—

MR. JAMES (interposing): Is not your real objection to this bill the fact that you are afraid this bill is simply a stepping stone to another bill to take care of the copper and iron industries? Is not that your real objection?

MR. INGALLS: No.

MR. JAMES: You are talking about mines already developed, and all these things have been already developed. The crisis is here. We have heard that from Secretary Lane and Mr. Baruch. The question is what are we going to do now that the crisis is here? If this bill will not take care of it, what plan will you suggest?

MR. INGALLS: I have not disputed that; I have simply advised confining attention to those matters in which the crisis exists.

MR. HAMLIN: If the present conditions are satisfactory, and we ought not to interfere in any way with them if you are right about that, this crisis would not have arisen, would it? If private capital and private industries engaged in these things are and had been equal to the emergency this crisis that is now conceded to be upon us would not have come, would it?

MR. INGALLS: The crisis is absolutely artificial. It becomes necessary to cut off certain importations. That is a condition which nobody in the normal market can foresee.

MR. HAMLIN: Certainly. It comes as the result of abnormal conditions throughout the world, for which we are not responsible. Now, then, what is our duty, as Members of Congress, under these existing conditions?

Ought we not to do something to try to meet this abnormal condition?

MR. INGALLS: I admit that.

MR. HAMLIN: Perhaps I have not understood you. The drift of your idea as it has impressed my mind is that we ought to do nothing. I understood you to say in answer to Mr. Wingo that we should not pass this bill, that private capital will take care of the situation if we will leave it alone.

MR. INGALLS: I beg your pardon; you have misunderstood me.

MR. WINGO: That is the impression I got.

MR. INGALLS: You have misunderstood me in that.

MR. HAMLIN: What is your remedy?

MR. INGALLS: Where you have misunderstood me is in this: I said private capital under the stimulus of high prices is already doing a great deal in these particular things. I said I am informed by the gentlemen who framed this bill that it is necessary to do something more.

MR. HAMLIN: Then, if high prices have already stimulated private capital, how could the Government step in and say to those same people, "We will guarantee you that the prevailing prices shall not drop below a certain point and interfere with the present stimulation of high prices. We are not fixing the maximum; we are only fixing the minimum." Ought that not to contribute to this stimulation?

MR. INGALLS: Yes.

MR. HAMLIN: Then how could you object to that? That is what this bill does.

MR. INGALLS: If people are already producing these things and do not need a guarantee of the minimum, why is it necessary to give it to them? I admit it is my understanding that this bill does that.

THE CHAIRMAN: Only if necessary to get the article.

MR. INGALLS: I believe there is a difference of opinion, that some think the guaranty may only be to some people and not to other people.

MR. HAMLIN: Not to be to some people, but it may affect some particular mineral and perhaps might not apply to others.

MR. INGALLS: You are going—

MR. HAMLIN (interposing): For instance, there is manganese produced in sufficient quantities so that the President finds that probably it may not be necessary for him to take any action in regard to that particular ore. But we give him the right to do it if it becomes necessary. But there is another ore which is mentioned in this bill and it becomes necessary for him to do that in order to stimulate it, and he is given the right to do.

MR. JAMES: It says, in section 14:

"That whenever the President shall find that an emergency exists requiring stimulation of the production of necessaries, and that it is essential that the producers of necessaries shall have the benefit of the guaranty provided for in this section, he is authorized, from time to time, reasonably and as far in advance as practicable, to determine and fix and give public notice of what under specified conditions are reasonable guaranteed prices in order to assure such producers a reasonable profit."

You do not suppose that applies to manganese; if we are producing more than we need, that there is going to be any stimulation given by the President in that situation for the production of manganese?

MR. INGALLS: That is the way I read the bill.

MR. JAMES: It says "whenever the emergency exists," and it would not exist if we were producing all we need.

MR. INGALLS: No.

MR. JAMES: Then it would not apply to manganese.

MR. INGALLS: Take the case of magnesite. The production is already increased, and some people have gone into the business and made large outlays under existing commercial conditions. Are you going to make a guaranteed price to them on top of that?

THE CHAIRMAN: Of course not.

MR. WINGO: It is only in those cases where, because of the uncertainty of the market, these mines do not attract capital so that these deposits will be developed. We actually need them now.

MR. INGALLS: Then you say you will stabilize prices for some people?

MR. WINGO: No; we are not doing that for the market. Take a practical illustration. Take, for instance, some of the things that are not being produced in sufficient quantities. There are men who are not willing to go out with the uncertainty of the market and develop those things, in the face of the fact that when the War is over and get back to normal conditions that property might not be a profitable proposition, and we would say to such men, "Would you be willing to put your money in a mine now, knowing that the guaranty that you would get would give you a reasonable profit on the capital which you would put in now, and which you might not be able to use after the War is over."

MR. INGALLS: I cannot answer that, generally. It is not a normal condition. We had the same condition in the zinc industry in 1916, where people put millions of dollars in a plant on preliminary figuring, with one year's amortization.

MR. WINGO: Suppose there is another place where private capital does not feel justified in going in and developing the ore. What are you going to do?

MR. INGALLS: Let the Government provide the capital.

MR. WINGO: You believe in giving subsidies instead of stabilizing prices and guaranteeing a contract for a sufficient length of time to justify private capital going into it?

MR. SAUNDERS: Doctor, I would like to ask your opinion about certain phases of this bill that you have not discussed and which, it seems to me, might lay the basis for some of the fears you seem to entertain. The thing which you fear more than anything else is that this regulatory bill, this legislation for the purpose of regulating these industries, may interfere with the industries and hamper them. Now, there are certain sections of this bill which I think might lay a foundation for that fear. Section 5, for instance, deals with the other parts of the situation. A good deal of the bill deals with the question of fixing minimum prices, and, of course, would encourage the industries; but there is another phase of

the bill which was not meant to encourage the industries, but which was meant to regulate them. For instance, section 5 permits interference by the Government whenever any royalty, charge, or commission or profit is unjust or discriminatory, and section 4 contains this language:

"That it is hereby made unlawful * * * to monopolize or attempt to monopolize, either locally or generally, any necessaries * * "

And that means necessaries enumerated in Section 1—

"to engage in any discriminatory or unfair or any deceptive or wasteful practice or device, or to make any unjust or unreasonable rate or charge, in handling or dealing in or with any necessaries."

In other words, the bill, in addition to providing a minimum price which would tend to encourage the industries, goes ahead and gives authority to provide a maximum price, and is not that the feature of the bill which really forms the foundations for your misgivings about it?

MR. INGALLS: Very much so.

MR. SANDERS: In other words, when you are fixing a minimum price, that tends to encourage production, and when you fix a price as a maximum price, if that price should happen not to be right, should happen not to be fair, that would discourage production. That occurred in the local industry when Dr. Garfield fixed a price which was not adequate for the small mines, particularly. Is not that the feature of the bill rather than the feature of the bill fixing a minimum price the one you have in mind?

MR. INGALLS: I have that very much in mind.

MR. SANDERS: What would you think about the provisions in the bill which permit the fixing of a price above which the producer cannot go and fixing the charges and commissions and royalties for all of this?

MR. INGALLS: I think it would be very dangerous.

MR. SANDERS: What would you think about the provisions in the bill which permit the fixing of a price above which the producer cannot go and fixing the charges and commissions and royalties for all of this?

MR. INGALLS: I think it would be very dangerous.

MR. HAMLIN: Gentlemen, it is after 12 o'clock, and the House has met, and we will be needed over there.

THE CHAIRMAN: Mr. Ingalls, we are very thankful to you for your kindness in appearing here, and we certainly appreciate it.

MR. INGALLS: Thank you, sir.

MAGNESIUM may be estimated rapidly, according to N. Busvold, by precipitating it from a mixture of calcium and magnesium salts by the addition of an excess of lime. After filtering and washing with an excess of lime, the precipitate is boiled with an excess of oxalic acid, and is thus converted into the soluble magnesium oxalate. The total oxalic acid is determined with permanganate, and the free oxalic acid is titrated, using methyl red as indicator.

Our War Finance Problem

Total expenditures of the Government from July 1, 1917, to May 15, 1918, were $10,365,629,602. For the period from January 31 to May 15, 1918, the average daily expenditure was approximately $39,000,000. On the assumption that the daily rate of expenditure for the remaining period of the fiscal year will be about the same as at present, the total expenditures for the remainder of the fiscal year would be $1,755,000,000, making a total of estimated expenditures of $12,120,000,000.

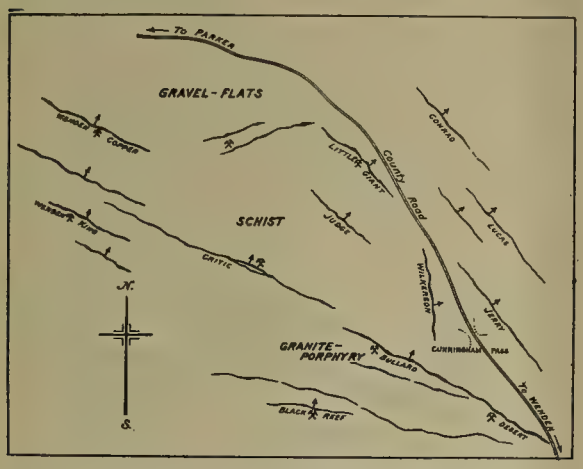
In view of the fact that the daily expenditures have been increased above the average, and in view of the fact that the operation of the war machinery is daily being extended, it has been thought advisable to add at least $150,000,000, which would make a total of $12,300,000,000 as the total estimated expenditures for the present fiscal year. The ordinary revenues of the Government, including Panama Canal tolls, less income and excess profits taxes from July 1, 1917, to May 15, 1918, were $1,063,345,638. On the basis of the average daily receipts from January 31 to May 15, 1918, of about $4,270,000, this total will be increased to $1,260,000,000. Various estimates have been made as to the probable returns from income and excess profits taxes for the present fiscal year. They range from $2,700,000,000 to $3,500,000,000. The latest estimate of the Secretary of the Treasury of the probable return of these two taxes is in excess of $2,700,000,000. On this basis the Treasury Department estimates that the revenue receipts of the Government as distinguished from proceeds of loans, will be about $4,095,000,000. Should this estimate of income and excess profits taxes be conservative, as many think, the receipts will be in excess of these figures.

The total advances to our Allies from July 1, 1917, to May 5, 1918, were $4,251,329,750. During the period from January 31 to May 15, 1918, the average daily advances to Allies were $10,670,000. On the assumption that the advances to our Allies will continue to the end of the fiscal year at the same rate, the total advances to them will approximate $4,750,000,000. If the total estimated advances to our Allies of $4,750,000,000 be deducted from the estimated total expenditures of the Government of $12,300,000,000, there remains $7,550,000,000, which would represent our own governmental expenditures. On the basis of the above figures, the percentage of total governmental expenditures to be met by taxes and ordinary receipts is approximately 33%. If the income and excess profits taxes yield a larger sum than has recently been estimated by the Treasury Department, this percentage will be increased. If the total estimated advances made to our Allies be deducted from our total expenditures, it is seen that we will pay at least 54% of our governmental expenditures from ordinary receipts and taxes. The deficit must be covered by loans. A part of our expenditures are for capital account and will finally yield revenue.—'Guaranty Trust Bulletin.'

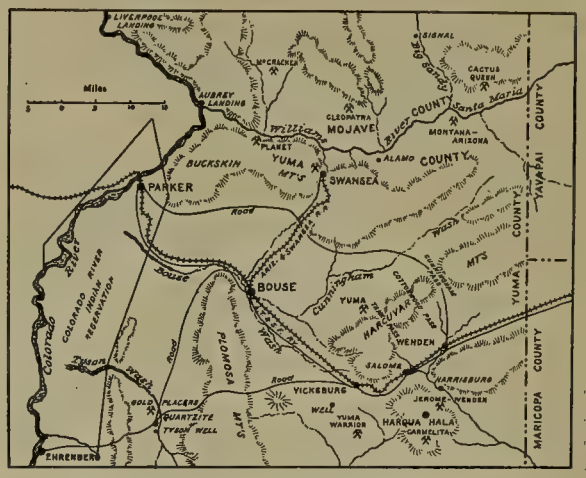
Cunningham Pass District, Arizona

By W. TOVOTE

The Cunningham pass country, in northern Yuma county, Arizona, recently has been attracting considerable attention. This is less because of the amount of ore being mined than for the fact that the ore is high-grade and of excellent character for smelting. Three mines are now producing steadily, others are in process of development, and small shipments are being made by lessees from undeveloped properties. The district is about 10 miles north of Wenden on the Arizona & California



SKETCH SHOWING PART OF VEIN-SYSTEM NEAR CUNNINGHAM PASS



SKETCH OF THE PARKER CUT-OFF DISTRICT IN YUMA COUNTY

branch of the Santa Fe system. It is part of the Ellsworth mining district.

Cunningham pass is a low saddle in the Harcuvar mountains. The main traveled road from points in central Arizona to Parker used to lead through this pass, but in recent years a new highway has been constructed along the railroad, which now takes most of the through-traffic. The country is a typical semi-desert. Water is scarce and wells supply most of the drinking water. Small towns and settlements have grown wherever water has been found in sufficient quantity. Vegetation is scanty, the mesquite and palo verde being the principal shrubs, and some ironwood is found along the arroyos.

Mining near Cunningham pass dates back at least 20 years. The Critic and the Bullard mines were started on rich surface-ores, and both produced for awhile. The Critic is credited with an output of $500,000 and the Bullard with $150,000. The Bullard was opened by four short tunnels, the longest being 320 ft., with a maximum depth of about 225 ft. vertically. Ore was also developed in two shafts. The ore-shoot in the tunnels was partly stoped and the mine closed because the owner did not care to operate it, while prospective buyers were reluctant to meet his price and terms. The mine has been worked intermittently since by lessees. The Critic is a shaft-mine. It was opened to the 400-ft. level and partly stoped, some good orebodies being overlooked. Lessees have operated it since with indifferent success, until J. Nohlecheck, about two years ago, opened several good ore-shoots, increasing the reserves steadily, while making regular shipments.

Two years ago H. Barkdoll, superintendent of the Old Dominion Copper Mining & Smelting Co., at Globe, and his associates, acquired the Wenden Copper mine, sank a shaft 200 ft. deep, shipped ore and then closed. Adjoining the Wenden are the Conrad claims, which were purchased by El Paso people who organized the Wenden King Mining Co. Considerable money was expended without much to show for the expenditure, and the enterprise came to grief. Activity lagged again, until recently a rather remarkable showing was made in the Little Giant mine. Here two lessees had stoped out a small surface-shoot of high-grade copper ore, ranging from 2 to 15 in. wide. At 35 ft. this gave out, but the new owners acquired a lease and option and continued sinking. At 75 ft. the vein suddenly widened to about two feet, and was followed for about 70 ft., yielding ore assaying from 15 to 20% copper. Sinking was resumed and the ore improved in value. A new level at 125 ft., driven for over 100 ft., revealed excellent ore, in some places being 40 in. wide. About 200 tons of ore was shipped from development work alone, which returned more than $50 per ton net. This new development has

been widely advertised and a number of new companies and lessees are entering the district.

GEOLOGY. The Cunningham pass country is worn down to the old gneiss or schist basement of pre-Paleozoic age. The schist is apparently derived mostly, if not exclusively, from intrusive rocks. Acid and semi-acid rocks, like biotite-gneiss and granite, prevail. The schist strikes N.60°E. and dips 25 to 30° to the north-west. Contorted and folded areas interrupt the uniformity. Paleozoic strata do not appear within five miles of Cunningham pass. The schistose complex has been invaded by intrusives. Two of these are prominent in the mineralized area and have probably influenced the ore deposition. They are: A granitic intrusion of the quartz-monzonite type, sending out numerous pegmatitic and aplitic dikes; and a semi-basic to basic intrusive, ranging from coarse hornblende-diorite to dense porphyritic dikes, resembling diabase. The latter strike generally north-west, while the pegmatite dikes lie in all directions and are irregular in outline, forming a network of dikes, sills, and penetrations in the schist. Both systems of intrusives are cut by the veins and sometimes are distinctly displaced.

The most important veins strike about 60 to 70° north-west and dip to the north-east. Flat and steep dips alternate, varying from 30 to 90°. Even reversals of dip have been found at places. Cross-veins striking N. 30°W. are similar to the main-veins in character and mineralization. Others with a course from north to N. 10°W. seem to carry more gold and less copper. Bedded veins with a strike about N.60°E. are ore-bearing, but likely to prove irregular. The chief importance of all the smaller veins is their enriching influence upon the main veins at intersection-points. Enrichment occurs as well in strike-intersections as in dip-crossings.

Composite stringer-veins predominate, usually with one fissure that is likely to persist over considerable distances. From the evidence available the veins must have been re-opened several times, and the principal fissure appears frequently in several displaced sections, joined by a network of stringers, giving the impression that the main mineralization shifted from one branch of an intricate fracture-system to another abruptly. The dislocating fractures had a course about N.30°E.

The mineralization indicates two distinct periods. The principal gangue of one period of mineralization is quartz, while the other period is characterized by iron, principally as hematite. Both are associated with copper and gold. The strong influence exerted upon the veins by the pegmatite dikes leads me to consider the pegmatite as responsible for the acid mineralization. The iron mineralization I attribute to the semi-basic intrusives. Seams and veinlets of hematite are frequent in the pegmatite dikes, from which it appears that the pegmatite antedates the basic mineralization in the veins, and that considerable replacement of quartz by hematite must have taken place. The hematite has been altered to limonite superficially, but not to any large extent. It occurs massive and in its micaceous variety. The latter is considered a more favorable sign of ore. It is probably due to stress and pressure and is coincident with areas of folding and contortion along the veins. These frequently have produced a false secondary schistosity, and often make the veins appear to conform to the schistosity, where they actually do not. Other gangue-minerals found are siderite, dolomite, and ankerite. Of these siderite is the most important and is closely associated with chalcopyrite. Possibly the hematite has been derived from siderite by metamorphism. Apparently post-mineral barite is common; less frequent is calcite, which is probably secondary. The metallization introduced chalcopyrite and pyrite with accessory gold. Silver is found, but seldom exceeds two ounces per ton, while the gold ranges from $2 to over $50 per ton. The copper has undergone considerable secondary concentration. Chalcocite, cuprite, and malachite are the principal products, while native copper, azurite, and chrysocolla are rarer. The ore generally assays higher than would be judged by its appearance, owing to a penetration of the hematite gangue by cuprite. Exceptional cuprite is found in perfect transparent crystals, accompanied by velvety malachite. The primary chalcopyrite is very pure and usually greatly in excess of the accompanying pyrite.

The orebodies are roughly lenticular, and vary from stringers to about four feet in width. A series of lenses, joined by narrow stringers, has produced a maximum stoping-length of 450 ft., and about the same proven depth in the Critic mine, the most extensively explored property in the district. The Bullard has an ore-zone about 150 ft. long. Favorable places for ore are folded areas, pegmatite-contacts, and the vicinity of basic intrusives. Intersection-zones increase the grade as well as the quantity of the ore.

The average grade of ore shipped from the district in the past was about 18 to 20% copper with about $10 gold per ton. Chalcocite-stringers only a few inches wide are mined, and on being followed they will widen suddenly to several feet of solid ore and then contract again. While careful sorting is required where the vein is narrow, the ore breaks remarkably clean in the bigger shoots. The number of men employed is small. A mine employing 10 men and shipping 200 tons per month should make a good profit, as the net smelter returns are from $50 to $70 per ton. The haul to Wenden costs about $4.50 per ton by team, but is now being done for less by trucks. The roads are fairly good and the grades not heavy. The Jerome scale of wages prevails, but labor is not very satisfactory, because many people dislike the hardships of the desert. The Bullard has shipped over 100 tons per month, working only two to three men, and the same ratio would be possible in most mines, if they were properly opened and employed power drills. The ore commands a ready market on account of its self-fluxing quality. The Clarkdale, Humboldt, Hayden, Sasco, and Douglas smelters have been receiving ore from the district. Cunningham pass is one of the few 'poor man's' copper districts in Arizona.

CREOSOTE has advanced to $2.10 per pound. The demand is active.

Hoisting With Steel Cables

By ERNEST LEVY

Ropes generally break within the lower 150 ft., and nearly always within the lowest 50, especially when the hoisting is done chiefly from the lowest level. This is due mainly to two causes, torsion and vibration.

1. On raising the load the rope twists, and the shorter the loose part becomes the greater is the stress on the rope, owing to the amount of twist having an increasingly shorter length over which to be distributed, hence, when the rope is wound up the torsional stress is greatest.

2. When raising, vibrations are caused to run down the rope; these on reaching the capping become reversed and run up the rope, and in places synchronize with those coming down; at these points of synchronization the strain is most severe. These points are situated within the lowest 150 ft., because at this distance the upward-going vibrations have diminished and died. Hence, the lower 150 ft. has become weakened; in cases, therefore, where the bulk of the hoisting is done from the lowest level it is not advisable to change the rope, end for end, as such procedure would bring the weakened part of the rope into that position which requires the greatest strength.

Another point of great strain is the two feet just off and immediately adjoining the drum, because here the rope has little room for movement, or for disposing itself to strain when the load is started from rest.

Another point of great wastage of life is that part of the rope which touches the sheave-wheel when the cage is at rest, and when the cage hangs freely and does not stand on the chairs, in which event the weight is off the sheave except in very deep shafts, where the weight of rope is a large factor.

The best method for prolonging the life of the rope is to cut from the lower end a length two or three feet in excess of the length of the arc of contact of the rope on the sheave-wheel when the cage hangs freely. This brings the two upper positions of weakness to new places where the strains on them will not be so great, and at the same time the better preserved parts take their places. Rapid hoisting, such as is usual in large coal mines and in the Rand mines, necessitates cutting off the cable every four or six months. One wire broken here and there is not a serious matter, but when several are broken in the same neighborhood the rope is dangerous.

The following directions to the master-mechanic are useful:

1. A weekly examination should be made of all ropes, cages, brakes, clutches, and sheaves, connected with hoisting appliances for raising or lowering men, and a test of the cage-dogs made.

2. The draw-bolt and pin attaching the cage to the rope should be annealed at least once every six months. When the cages are changed it is advisable to have the draw-bolt annealed.

3. Ropes should be greased at least once every month.

4. Ropes should be re-clamped at least once every six months, a minimum of six feet of the rope being cut off each time. The portion cut off must be carefully examined, both as to the exterior and the interior, for corrosion and breaks.

5. Ropes should be discarded either when the number of broken wires in one 'lay' exceeds six, or when the wires on the crown of the strands are worn to less than 65% of their original diameter, or when they show marked signs of corrosion, provided, however, that when such broken wires are reduced by wear more than 30% in cross-section, the number of breaks in any lay of the rope shall not exceed three. In any case, ropes should not be used for more than three years unless a piece cut from the clamping end has been tested by actual breaking-test under supervision of a competent authority.

6. Ropes should be securely fastened to the drums and, when in use, should never be fully unwound; at least one full turn must always remain on the drum.

The 72 outside wires of the rope come to the surface once in every complete turn in the rope's construction, or in every 'lay,' as it is technically termed. With respect to external wear, the places in the rope that should be specially watched are those where the contact with the sheaves or guide-pulley occurs at acceleration or retardation periods of the hoist. These places are also likely to suffer more than others from internal wear, except perhaps that portion of the rope near the cage, which, although generally subjected to no wear from rubbing, yet is exposed to a corrosive effect as well as to the bending and shock stresses. In addition to these positions, attention must be directed also to that part of the rope which lies between the drum and the sheave when the load is at the bottom of the shaft, as also to those parts of the rope which come in contact with the flanges of the drum.

Records of results of all the above directions should be kept either on regular forms or in a book provided for the purpose.

Hoist-men should be warned that:

1. Any defects should be reported immediately to the superintendent, master-mechanic, or other person in charge of the works at the time.

2. Every morning, before hoisting or lowering men, each cage must be run a complete trip up and down the shaft, with a view to making sure that everything is in good working condition.

3. The night-shift man should be required to make an examination daily of all parts of the hoist and to pay particular attention to the controller, brakes, clutches, and ropes. The results of such examination should be recorded on the form provided therefor, and placed on file at the mine office.

4. After every re-clamping of the rope, every rope so treated should be run for at least four trips under full load, before being used for lowering or hoisting men.

5. When a new hoisting-rope is put into use, it should be run for at least 10 trips under full load before being used for lowering or hoisting men.

Aluminum in Germany

A hyphenated Spaniard, by the name of Rodolfo Goetz Philippi, writing for the 'Revista Minera Metalúrgica y de Ingeniería,' of Madrid, professedly knows much concerning the detail of aluminum production in Germany at the present time. He affirms that the Neuhausen concern produced 10,000 metric tons of aluminum last year, using ores derived for the most part from the Austrian bauxite mines. These deposits are inferior in grade to those of France and Spain, but the German metallurgists are said to have so far perfected the process of extraction that large quantities of silica in the bath no longer entail the difficulties that were formerly experienced from an excess of that ingredient. The Neuhausen works are utilizing 80,000 hp. in the form of hydro-electric energy, and the house of Giulini Brothers is constructing a new aluminum plant in Bavaria on the river Inn, where a hydro-electric installation developing 50,000 hp. is being erected. This concern is now producing metal assaying 99.75% pure as tapped from the furnaces. Mr. Philippi also states that the Neuhausen works produce aluminum by means of the Moscicki process which involves the recovery of fixed nitrogen as aluminum nitride in the refining of the bauxite. This is leached, and ammonia is recovered from the liquor, while the alumina is precipitated. The details given are not sufficient to show how this differs from the Serpek process. It is evident, however, that the Germans are carrying the principles of conservation to a high degree in this industry. They are not missing so valuable an opportunity as is presented in the refining of bauxite for utilizing coal slack in order to extract the fixed nitrogen evolved with producer gas made from such cheap fuel. So far this opportunity has been neglected in the United States, although we are hard-pressed for fixed nitrogen and the bauxite of the Southern States is nearly all produced within a few miles of coal mines where similar processes might be utilized. The fact that the Germans are able to employ low-grade bauxite is significant also. The United States has recklessly allowed too many of its trained metallurgists and chemists to go to the firing line instead of keeping them where they can do a higher good through promoting technical advance for the more effective conduct of the War. Germany seems to have been far-sighted in this regard, and it behooves us to attend with equal care to such vital problems. We are inclined to think that the resources of Germany were fully known before the War, but the letter on aluminum in Germany, cited above, gives an account of new discoveries of aluminum ores, thereby greatly augmenting the supply. The deposits recently found are in Alta Hesse, and consist of nodules in the basaltic flows in the Vogelgebirge, the Spessart, and other mountainous areas containing similar rocks. The secondary hydro-aluminous silicates are so abundant in these lavas as to admit of crushing the rock and floating out a product rich enough in aluminum to serve as an ore. The alteration products formed in the basalt are said to exist chiefly as pisolitic nodules, varying from the size of peas to that of melons, while in some cases the change has progressed so far as to leave a mere skeleton of the original rock. The Austrian deposits are said to show a developed tonnage at the end of 1917 of not less than 19,000,000 tons, having the following analyses:

	High-grade, %	Low-grade, %
Al_2O_3	65.50	53.40
SiO_2	0.80	1.54
Fe_2O_3	20.34	30.80
Ti_2O	3.07	2.00
Moisture	11.62	12.00

The lateritic deposits of bauxite worked at Giessen, Gruenberg, Lich, and Gelnhausen contain from 48 to 52% Al_2O_3, and 26 to 34% Fe_2O_3 for the reddish colored ores, and from 57 to 74% Al_2O_3 with about 8% Fe_2O_3 for the white product. We must credit Mr. Philippi with having commented approvingly upon the foresight of the American Aluminum Co. in securing a preponderating interest in the bauxite mines of Dutch Guiana. The same company is working the deposits on Canje creek in the Berbice river district of British Guiana. Similar deposits are reported from many points in Venezuela and from the outer edges of the great bowl of the valley of the Amazon, particularly in Colombia and Ecuador.

Solder containing practically no tin is reported to have been discovered by the Germans. Tin there is scarce because none is mined in Germany and none can be imported. So, to provide a substitute, cadmium was tried first, large quantities of this metal being found in Germany. An excellent solder was made from 80% lead, 10% cadmium, and only 10% tin. This, however, could not be used for making and sealing cans for foods, as the lead in contact with fruit acids produces poisonous salts. Bismuth, another metal found in Germany, was then tried. This, with cadmium and some other metals not revealed, formed a solder which is reported to be non-poisonous. It is almost free from tin. Germany's tin problem must be serious, for a recent Government decree has ordered the confiscation of the tin tops of all beer rings and stems. Even the church bells have been appropriated to a large extent for their metal content.

The tungsten deposits of Essexvale, Southern Rhodesia are producing ore, thus far obtained from 'rubble' or detritus on the surface. The sources of the tungsten minerals, wolframite and scheelite, have not been found. The granite rocks are cut by greisen zones, and typical greisen minerals, including quartz, fluorite, and topaz, are present; there has also been some mineralization of the rock, with deposition of sulphides.

The State of New South Wales, Australia, produces considerable molybdenite. The Kingsgate mine in the north-central region, contains both bismuth and molybdenum. A recent yield from 101 tons of ore was 3804 lb. Bi_2S_3 ad 1297 lb. of MoS_2 concentrates.

The Basic Principle of Concrete Mixes

By DUFF A. ABRAMS

It is commonly stated that concrete is composed of a mixture of cement, sand, and pebbles or crushed stones. This conception of concrete overlooks one essential element of the mixture; namely, water. An exact statement of the ingredients of concrete would be: Cement, aggregate, and water. The last-named material has not yet received proper consideration in tests of concrete or in specifications for concrete work.

Early users of concrete centred their entire attention on the quality of the cement, and practically disregarded the characteristics of the other ingredients. During the past dozen years some attention has been given to the importance of the aggregate, but it is only recently that we have learned that the water also requires consideration.

Tests made of the effect of size and grading of aggregates have shown that the reason why concrete of higher strength and durability can be produced from well-graded aggregate as compared with a poorly-graded aggregate is that the former can be mixed with less water. If this is not done, no advantage is gained from using a coarse, well-graded aggregate. The following discussion shows that a similar conclusion can now be stated with reference to a rich concrete mixture as compared with a lean one:

While the injurious effects of too much water in concrete are apparent, tests made in this laboratory show that the fundamental part played by water in concrete mixtures has been overlooked in previous discussions of this subject. The relation mentioned above is emphasized by a series of compression tests of about 1600 six by twelve-inch concrete cylinders made as follows:

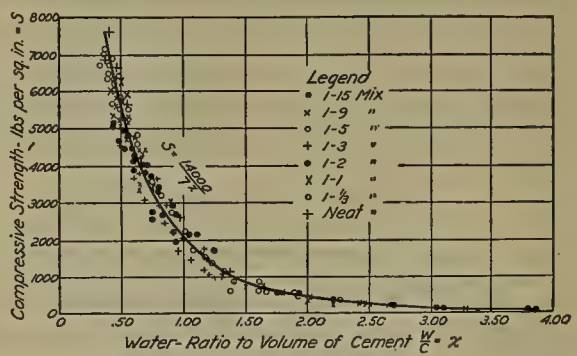
Mixture Cement to Aggregate	Range of sizes of aggregates	Consistence
1 to 15		
1 to 9		
1 to 5	0 to 14-mesh sieve	7 different consistences for each mix and aggregate
1 to 3	0 to 4-mesh sieve	
1 to 3	0 to 1¾-in.	
1 to 3	0 to 1½-in.	
1 to 1	0 to 2-in.	
1 to ⅓		
Neat		

The mixtures used covered a wide range, as did also the grading of aggregate and consistence. The aggregates consisted of two sizes of sand and mixtures of sand and pebbles graded to the sizes shown. The mixture is expressed in terms of volumes of dry cement and aggregate, regardless of grading; that is, a 1:5 mix is made of 1 cu. ft. cement (1 sack) and 5 cu. ft. of aggregate as used, whether a sand or a coarse concrete mixture.

*Abstract from 'Concrete Highway Magazine.'

This series gives valuable information on the effect of changing the quantity of cement, the size of the aggregate, and the quantity of water. The effect of many different combinations of these variables can be studied. One set of relations gives the effect of amount of cement using aggregates of different size and grading; another set of relations gives the effect of different quantities of water, varying both mixture and size of aggregate, etc. In all respects these tests bear out the indications of both earlier and later series. These tests are of interest in that they reveal for the first time the true relation between the strength and the proportions of the constituent materials in concrete.

The figure shows the relation between the compressive strength and the water content for the 28-day tests. The water content of the concrete has been expressed in terms of the volume of cement, assuming that the cement weighs 94 lb. per cu. ft. Distinguishing marks are used for each mixture, but no distinction is made between aggregates of different size or different consistences.



RELATION BETWEEN COMPRESSIVE STRENGTH AND WATER CONTENT

When the compressive strength is platted against the water in this way, a smooth curve is obtained, because of the overlapping of the points for different mixtures. Values from dry concretes have been omitted. If these were used we should obtain a series of curves dropping downward and to the left from the curve shown. It is seen at once that the size and grading of the aggregate and the quantity of cement are no longer of any importance except in so far as these factors influence the quantity of water required to produce a workable mixture. This gives us a new conception of the function of the constituent materials entering into a concrete mixture and is the most important fact that has been discovered in the studies of concrete conducted in our laboratory.

The equation of the curve is of the form,

$$S = \frac{A}{B^x} \ldots\ldots (1)$$

where S is the compressive strength of concrete and x is the ratio of the volume of water to the volume of cement in the batch. A and B are constants whose values depend on the quality of the cement used, the age of the concrete, and the curing-conditions.

This equation expresses the law of strength of concrete so far as the proportions of materials are concerned. For given concrete materials the strength depends on only one factor, the ratio of water to cement. Equations that have been proposed for this purpose contain terms which take into account such factors as quantity of cement, proportions of fine and coarse aggregate, voids in aggregate, etc., but they have uniformly omitted the only item that is of importance; that is, the water.

For the conditions of these tests, equation (1) becomes,

$$S = \frac{14000}{7^x} \ldots\ldots (2)$$

The relation given above holds so long as the concrete is not too dry for maximum strength and the aggregate not too coarse for the given quantity of cement; in other words, so long as we have a workable mixture. Other tests made in this laboratory have shown that the character of the aggregate makes little difference so long as it is clean and not structurally deficient. The absorption of the aggregate must be taken into account if comparison is being made of different aggregates. In certain instances a 1:9 mixture is as strong as a 1:2 mixture, depending only on the water content. The strength of the concrete responds to changes in water, regardless of the reason for these changes.

It should not be concluded that these tests indicate that lean mixtures can be substituted for richer ones without limit. We are always limited by the necessity of using sufficient water to secure a workable mixture. So in the case of the grading of aggregates. The workability of the mixture will in all cases dictate the minimum quantity of water that can be used. The reason a rich mixture gives higher strength than a lean one is that a workable concrete can be produced by a quantity of water which gives a lower ratio of water to cement. If an excess of water is used we are simply wasting cement. Rich mixtures and coarse, well-graded aggregates, are as necessary as ever, but we now know just how these factors affect the strength of the concrete.

Practical use may be made of the curve in estimating the relative strength of concretes in which the water content is different for any reason. For example, a concrete mixed with 7.5 gal. of water (1 cu. ft.) to one sack of cement (allowance being made for absorption of aggregate) gave a strength in this series of 2000 lb. per square inch ($x = 1.00$). For $x = 0.80$ (6 gal. of water per sack of cement) we have 3000 lb. per square inch; for $x = 0.75$ (5.6 gal.) 3300 lb. per square inch. Concrete in a 1:4 mixture (same as the usual 1:2:3 mixture with a coarse sand) should be mixed with 5½ to 6 gal. of water per sack of cement. The importance of any method of mixing, handling, placing, and finishing concrete that will permit the work to be done with a minimum of water is at once apparent.

Assaying on the Rand

As a subject for discussion by the Chemical, Metallurgical and Mining Society of South Africa, John Watson and Chris. Toombs contributed notes entitled 'Assay Economics,' from which the following is abstracted:

Litharge, the largest item of cost in assaying, is now made on the Rand. There is a doubt whether this substance is being used for its proper function, that is, as a lead producer for gathering the gold in the charge being fused, also as a flux. Excessive quantities of litharge are used at times. It costs 60 shillings per 100 lb., equal to 14.4 cents per pound.

Sodium carbonate is also made on the Rand. It acts satisfactorily, and costs 12.5 shillings per 100 lb., or 3 cents per pound.

Borax has been found unnecessary if the furnaces are kept in good condition and at a high temperature. The lead button breaks away clean and bright from the slag. Substitution of fluorspar for borax was tried. The melting-point of CaF_2 (1330° C.) is much higher than that of $Na_2B_4O_7$, and the fluorspar often caused the charges to boil over the crucible; therefore it is not suitable. As a flux in reducing gold precipitate it acts well, replacing half of the borax.

Corn-meal is an excellent substitute for charcoal or flour as a reducer.

Crucibles are all made in South Africa. The East Rand Proprietary reports the following results:

Year	Fusions	Crucibles used	Fusions per crucible
1917	204,200	16,280	12.5
1914	203,600	9,300	21.9

Opinions are divided on the use of part cement and part regular powder for cupels. The cement is decidedly economical costing 2 shillings per 100 cupels, or a half-cent each, but frequently the cupels crack.

MINERAL PRODUCTION of Venezuela during 1917 was 30,913 oz. of gold, 42,271 tons of copper ore, 54,072 tons of petroleum, and 20,165 tons of coal. The coal mines are all operated directly by the Government. The entire product was sold within the country at an average price of 24 bolivars ($4.63) per ton at the pit's mouth. The Ministry states that it is collecting data for a new law upon petroleum production, and urges that the present mining law be entirely changed.

WAR-BREADS containing bran have been found to produce secondary acid fermentations that are detrimental to health. To overcome the difficulty it is recommended that the dough be made with lime-water, the yeast being subsequently incorporated with the dough.

NEW YORK

Financial Situation.—A. I. M. E. Affairs.—Telephone and War.

The absence of any depressing war news has doubtless helped to maintain prices and, in some instances, to appreciate values during the past week. Further extensive selling of the two more recent issues of Liberty Bonds has, on the other hand, brought the market price near the low records of the year. The 4s now stand at 94, and the 4¼s at 96. Treasury Certificates of indebtedness at the rate of $750,000,000 are to be issued every two weeks, and will bear interest at 4½%. The fourth Liberty Loan is timed for October; the amount will be $6,000,000,000, according to recent advices; and the rate of interest will be the same as the last issue. The new loan will create a record if forecasts prove reliable, the minimum being nearly $1,000,000,000 more than the British loan of February 1917. The comparative magnitude of the financing of the two countries may be considered from the fact that the British loan was placed 18 months after the previous loan. About the same time has since elapsed without any further call of this sort. The shorter intervals of time between Liberty Bond issues indicates the financial necessities of this Government, also that War expenses are increasing at a prodigious rate. On the other hand, it would seem that the financial necessities have been over-estimated in the past, as indicated by the smallness of the last issue as compared with official forecasts of requirements made previously. Whether the $6,000,000,000 mentioned will be the sum asked for in October is far from certain, but it is evident that a larger call is unlikely.

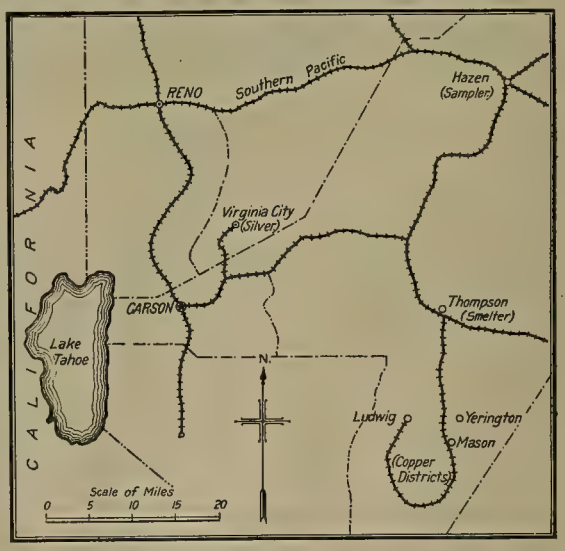
The new officers of the Executive Committee of the New York section of the A. I. M. E. are as follows: Allen H. Rogers, chairman; Forest Rutherford, H. C. Parmelee, vice-chairmen; H. C. Parmelee, treasurer; Walter S. Dickson, secretary; with J. E. Johnson Jr., F. T. Rubidge, and P. G. Spilsbury. The first meeting under the new regime was held at the Machinery Club on June 20, when the advisability of continuing the meetings throughout the summer months was discussed, also the question of holding the meetings elsewhere. It was considered that the committee should call meetings when suitable or feasible. With regard to the place of meetings some spot more central to the homes of the majority of members was considered. Three practical suggestions were made. One was to the effect that the section should take advantage of the fact that a splendid collection of minerals was now housed in the Natural History Museum, and that the meeting should be held there after a dinner in one of the nearby hotels; another was that the Institute should follow the practice of the Mining and Metallurgical Society by holding the meetings at the club at Columbia University; and the third was that the dinner should be held in the vicinity of the Institute headquarters on 39th street, and that the meeting should follow in the Engineering Societies building. Inaccessibility of the Machinery Club after office hours is perhaps responsible for the small number of local members who attend the meetings. In these days of thrift and war economy the price ($1.75) of the dinner is no incentive to a large and representative gathering; but the committee has doubtless found it impossible to efficiently cater at a smaller sum. Members are welcomed to the meetings after the dinner, but the number who have the courage to join the gathering at this stage is so small as to be negligible. The business and technical sessions might well be held in a different room; and the suitability of the United Engineering Societies building will doubtless receive due consideration.

After the last business meeting, members listened to an interesting lecture by H. J. Carroll, of the New York Telephone Co. on 'The Telephone and the World War.' The importance of effective field-telephone systems, especially at critical times, was dealt with realistically, and lantern-slides were shown; the particular adaptation of modern-warfare telephone installations in Mexico, Gallipoli, Italy, France, and Mesopotamia, was described in detail. One of the many modifications of the telephone of vital importance in modern warfare was an instrument, in appearance like a stethescope, for the purpose of detecting the working of enemy tunneling companies in the vicinity of trenches or underground passages.

MASON, NEVADA

Notes on a Lyon County District.

Copper mining has made considerable progress in this district during the past 12 months. Living conditions here



MAP SHOWING LYON COUNTY COPPER DISTRICT, NEVADA

are excellent, and the mines are within a few miles of Yerington and Mason. The former town is the seat of Lyon county and a centre for the agricultural interests in the fertile Mason valley. Skilled labor and miners are in demand.

The Bluestone Mining & Smelting Co., at Mason, is shipping a considerable quantity of oxidized copper ore to the

Thompson smelter; in addition to this it is now regularly shipping flotation concentrate to Utah smelters. The property of this company, formerly owned by J. D. De Lamar, has recently changed hands at the reported figure of $1,500,000, but this has not been officially confirmed. The new owner is the Dominion Reduction Co., with headquarters at Montreal and New York. Maurice W. Summerhayes, late of the Porcupine-Crown at Porcupine, Ontario, has taken over the management at Mason. A new 400-ton flotation mill has recently been completed, and started dressing sulphide ore, which carries an average of 2% copper. Plans provide for duplication of this plant, and it is intended to proceed with this new work almost immediately.

Copper production of the Mason Valley Mines Co. for May was 1,759,728 lb., against 1,058,400, 1,455,200, 1,253,000, and 1,536,600 lb. in the previous months of 1918.

LEADVILLE, COLORADO

Acid Mine Water.—Manganese and Molybdenite.

Generally speaking, mining in this district is unusually quiet. A number of the larger companies, including the Western Mining, Star Consolidated Mining, and Yak M. M. & T., have reduced their working forces. Good miners are scarce, but it is doubtful if more men would be employed if they were available.

The new management (J. G. Hardy in charge) of the Yak Mining, Milling & Tunnel Co., representing the American Smelting & Refining Co., which on January 1 purchased a half interest in the property, is having great difficulty in draining the workings of the Cord and White Cap, the two most productive sections. These workings extend several hundred feet below the tunnel-level and include the largest lead, silver, zinc stopes in the district. The water, which seeps into the Cord and White Cap shafts through extensive deposits of pyrite extending from the Yak to the Moyer and flows into the large open area in these properties, has become strongly acid (SO_4) and corrosive to pumping equipment. The trouble became pronounced early in the spring when surface water greatly augmented the natural flow in the lower Yak workings. The closing of the Moyer mine of the Iron Silver Mining Co., which had maintained large pumping plants in two shafts, also diverted a heavy flow to the Yak, giving the pumps at the Cord and White Cap an unusual burden. The water was more acid than in former years, and destroyed equipment almost as fast as it could be put in. As a result, the lower levels of both Cord and White Cap have been flooded. Additional plant has been secured from other local mines, and rapid progress is now being made in unwatering.

M. L. Buchanan and associates have taken a lease from the Down Town Mines Co. on the A. V. property at the southern limits of the city in California gulch. A steam plant has been put in, and the shaft is being repaired. The A. V. has been idle for several years, but when last active was a large producer of manganiferous-iron.

The May output of the Bohn on Carbonate hill was 700 tons of manganese ore averaging 36% Mn, exceeding the April production by 200 tons. Extraction of silver-bearing iron ore was started last month, and a steady output is being maintained.

Denver men interested in the Weldon property, between the Penrose shaft of the Down Town Mines and the Bohn, recently examined it for re-opening. The Weldon has not been active for nearly 20 years, and was flooded with the other Down Town mines in 1907. Drainage at the Penrose has unwatered it. It is considered to be on the trend of the Bohn manganese shoot, and is surrounded by large ore-bodies under development in the Penrose and Grey Eagle. The possibility of resumption in the near future is one of the brightest factors in the present outlook of Leadville.

Sinking at the Northern shaft of the Dold Mining Co. has been suspended owing to the increased demand for manganese being extracted from the mine. The shaft is 67 ft. below the old bottom level, and has cut a new shoot of high-grade manganese. The lower contact has not been encountered and sinking will be resumed later to accomplish this. The Northern is now producing the largest quantity of manganese since its re-opening two years ago. The plan for establishing the Newell shaft as the hoisting centre of this property is again under consideration.

During May the Climax Molybdenum Co. made two shipments of 25 tons of concentrate each, reported to be worth $200,000. Development at the mine on Bartlett mountain, as reported by the manager, J. H. White, is progressing most favorably. A large and steady tonnage of ore is being extracted through the upper tunnel, where ore-reserves are large. The new White tunnel, 200 ft. lower on the mountain-side, has been advanced to a distance of 500 ft. For its entire length it is in a solid ore. The tunnel will be equipped with electric-haulage system and made the main outlet channel of the enterprise.

A bunk-house for 70 men and three residences have been erected at the mine, and at the mill a boarding-house and several cottages. Another unit will be added to the mill during June, increasing its capacity to 500 tons daily.

Climax is considered to be the future mainstay of Leadville and will draw on the latter for all supplies. Should the Climax field be awarded to Lake county, in the suit pending between Lake and Summit counties, Leadville will certainly derive great benefit.

TORONTO, ONTARIO

Oil Development.—Labor at Porcupine.—Boston Creek.

There is a marked revival of interest in oil and natural gas development, due to the success of the Union Oil & Gas Co.'s operations in Dover township, near Chatham, Ontario. Some time ago oil was struck in a well 3185 ft. deep. This has since been yielding steadily, and recently a second well sunk to 3277 ft. was producing about 400 bbl. daily. Eugene Coste, a well-known oil engineer who has visited the field, states that it presents every indication of persistency. The formation is the Trenton limestone, the same as that which has yielded large quantities of oil in the western Ohio and Indiana fields. This is the first time that oil has been obtained from this formation in Canada, the reason, in Mr. Coste's opinion, being that hitherto drilling has been too shallow to reach the oil strata. With deeper drilling large areas might be opened. Oil operators are preparing to act upon this theory, and many new wells will shortly be put down. A recently-reported find of oil on the Canadian Northern Railway, 70 miles north-west of North Bay, has resulted in the staking of a large number of claims in that vicinity.

The shortage of labor at Porcupine, which is seriously curtailing gold production, has been brought to the attention of the Canadian government. Mine operators hope that action may be taken to relieve the situation.

The annual report of the Dome Mines for the year ended March 31 shows that 247,000 tons of ore was treated during the eight months the mill was in operation, compared with 459,530 tons during the previous year. Total earnings were $1,030,758, and net profit $355,023; compared with $2,171,785 and $952,449 in 1916-'17.

The Hollinger Consolidated is much in need of labor, its staff having lately been considerably reduced. It has declared a dividend of 1%.

Diamond-drilling is under way at the Dome Extension, with the object of ascertaining the direction of the vein system.

A new vein, 8 ft. wide, showing visible gold and telluride, has been found on the Miller Independence at Boston Creek, a little way north of present workings.

CRIPPLE CREEK, COLORADO

General News of the District.

By an agreement made between the Stratton's Cripple Creek Mining & Development Co. (The Stratton estate) and the Findley Mines Co., Basket and Luce, discoverers of the Basket and Luce vein in the American Eagles mine on Bull hill, have resumed work. The royalties from ore marketed will be deposited in escrow pending settlement of a suit between the two companies. The Findley company has brought suit to establish extra-lateral rights to the vein in question, from which the operators named, sub-lessees from W. L. Jamieson of Denver, the original lessee from the Stratton estate, have mined and shipped rich gold ore.

A new vein for the Specimen mine has been cross-cut while driving from the 13th level of the Orpha May shaft to a point under the main shaft of the Specimen mine on Bull hill. The ore is of good shipping grade, but the vein will be left undeveloped until such time as the contract is completed. The Specimen is a Stratton Estate property under lease to the Patterson Bradley Leasing Company.

Development on properties of the United Gold Mines Co. during 1917 totaled 4538 ft., 3130 ft. has been completed in the first four months of 1918. This work was performed by the company or its lessees at its mines on Bull and Ironclad hills and Battle mountain.

The financial statement for 1917 shows disbursements of $30,896, receipts, $17,639, making a loss of $13,257. For the first four months of 1918 disbursements totaled $21,341 and receipts $19,836, making the loss for the present year, $1505.

Two Tenderfoot Hill properties—the Queen Bess and Ella W—are again producing. The former is operated from the 1000-ft. level of the El Paso Gold King mine in Poverty gulch—a depth on the Queen Bess of close to 1500 ft. The ore on the Ella W. is mined near the surface. The Queen Bess ore is of 2-oz. grade; the Ella W. ore of low tenor.

The Jackson or main shaft of the Gold Sovereign Mining & Tunnel Co., on the south slope of Bull hill, has been leased to Evan J. Williams and Ben Olsen, well-known here, who have been operating on the north end of the Cresson property adjoining.

The Victory Gold Mining Co. is mining a good grade of ore on four levels of the Howard shaft of the Mary McKinney company on Gold hill. The same company is also shipping low-grade ore from the Beacon shaft of the Prince Albert group on Beacon hill. Both are leased properties.

LEAD, SOUTH DAKOTA

General Notes From the Black Hills.

Hill City.—H. H. Francis has made arrangements to resume work on his property near Oreville. It is expected that regular shipments of pyrite will be made. Motor-trucks will be employed in carrying the ore from mine to rail, a distance of six miles. The deposit is large and a considerable quantity could be shipped.

The American Tin & Tungsten Co. expects to start work at its tin properties. The Cowboy mine will be further developed and with other properties in the vicinity should supply a steady tonnage to the concentrator.

Keystone.—Regular shipments of copper ore are being made from the Blue Lead mine. Some machinery will be installed to facilitate mine work.

Deadwood.—Work at the Echo has been temporarily suspended awaiting the arrival of electric pumps to handle the water. The hoist and compressor have been moved from the main shaft to the new place of work, where lead-silver ore will be developed. A shaft will be sunk several hundred feet. The ore is high-grade galena, containing considerable silver.

The Golden Crest mine is being unwatered. It is also proposed to start the cyanide plant.

VANCOUVER, BRITISH COLUMBIA

Canadian Mining Institute Western Branch Affairs.

The annual meeting of the Western Branch of the Canadian Mining Institute, held at Vancouver on May 27, was well attended. It was agreed that steps would have to be taken to shake-up the organization. A Council was appointed as follows: J. D. Galloway, Provincial resident engineer of Mineral Survey District No. 2, with headquarters at Hazleton; George Winkler, of Victoria; John Hunt, general superintendent of the Canadian Western Fuel Co., Nanaimo; Thomas Graham, general superintendent of the Canadian Collieries, Cumberland; N. Turnbull, professor of mining in the University of British Columbia; J. G. Davidson, professor of physics in the University; A. B. Clabon, president of the Vancouver Chamber of Mines; E. A. Haggen, editor of the 'Mining and Engineering Journal' of Vancouver; Robert R. Bruce, manager of the Paradise mine, East Kootenay; S. S. Fowler, manager of the New Canadian Metal Co.; Oscar Lachmund, general manager of the Canada Copper Corporation; and E. E. Campbell, superintendent of mines of the Granby Consolidated Mining & Smelting Co. R. H. Stewart, manager of the Sunloch mines was made chairman, and W. Fleet Robertson, Provincial Mineralogist, vice-chairman. For the purpose of keeping informed on problems affecting every branch of mining it was decided that the Council should be given power to appoint sub-committees whose duty it would be to keep in touch with matters affecting the classes of mining work to which they were assigned and in the selection of which the special qualifications of the respective members would be the only consideration. These sub-committees will be as follows: coal, copper-gold, silver, lead and zinc, legislation, and membership. At the meeting three interesting papers were read. One by Frederick Keffer, read by W. M. Brewer, resident engineer for Mineral Survey District No. 6, was entitled 'Flotation Practice at Highland Valley Mines.' Another on 'Petroleum in British Columbia' was by E. A. Haggen; and the third by E. E. Campbell, of Granby Consolidated on 'Mining Operations at Anyox, B. C.'

VICTORIA, BRITISH COLUMBIA

New Mining Regulations.

Three amending acts, directly in the interests of men working in and around mines or smelters, were passed at the recent session of the British Columbia Legislature. These are entitled 'An Act to Amend the Labour Regulation Act,' 'An Act to Amend the Metalliferous Mines Inspection Act,' and 'An Act to Amend the Coal Mines Regulation Act.' The former provides for an eight-hour working day for all men employed "in, or about any coke-oven, smelter, concentrator, or mineral-separation plant." The chief amendment to the Metalliferous Mines Inspection Act is that providing for an eight-hour way to those employed underground, whose day will start when they leave the surface and end when they reach it again, as well as those employed on the surface. These two Acts will become effective on March 31, 1919. The amendment to the Coal Mines Regulation Act gives surface workers at coal mines the eight-hour day from March 31 of next year. New legislation also stipulates that inspectors of metal mines, after making their inspection, shall post the result thereof in some prominent place outside the workings, in order that the miners may be kept in touch with the conditions under which they are working. Another provision is that "every drill used in stoping in any mine where the character of the ground is such that dust is caused" by the work shall be equipped with a water-spray.

ALASKA

Juneau.—As already mentioned in the 'Press' of June 22, owing to the shortage of labor, the Alaska Juneau company is to discontinue using ball-mills and start the pilot stamp-mill. The new mill cannot be run economically on a 1000-ton basis. The present plans are to crush coarse, stamp the ore, and convey it from stamps of the pilot mill to the tube-mills of the new mill, side-stepping the ball-mills.

Skagway.—From a mine 80 miles from here, ore is being profitably carried to the Trail smelter, British Columbia, for reduction. The claims are the Venus group owned by A. M. Dewey of Spokane and a syndicate of Washington and Eastern men. He says they have shipped $200,000 of ore in the last two years. This syndicate is also working a property on Prince of Wales island, from which gold-silver-copper concentrate is shipped to the smelter.

Treadwell.—The Alaska Treadwell company is installing a 2-ton Heroult steel furnace, which has recently arrived from the East. With the addition of this furnace the Treadwell foundry will be the most modern foundry in Alaska. Other plant consists of two cupolas for iron castings, all being served by a traveling electric crane. A large quantity of scrap-iron and steel, accumulation of many years, is available as raw material. The company is making preparations to mill the ore from its molybdenum mine at Shakan. Extensive development has been under way for the past eight months.

ARIZONA

Globe.—The Iron Cap company paid 75c. per share on June 29.

Jerome.—This district seems to be again of more interest, as in the past week or two, three of the active prospects—Verde Combination, Pittsburgh-Jerome, and Calumet and Jerome—have exposed favorable formations. This, with the anticipated starting of the new smelter of the United Verde Extension, and the prospect that Jerome Verde will begin extraction of ore from the Maintop claim, all tend to create the same degree of activity and excitement that prevailed during the boom days of the fall of 1916. Now, however, it is not due to stock-gambling and blind speculation, but is the outcome of carefully following and keeping track of the extensive and systematic development work that has been carried on at the active properties during the past year and a half.

United Verde Extension pays 75c. per share on August 1.

Oatman.—Mine employees in this district are asking for an increase of 50c. per day. The companies offer 15c. The Federal mediator, H. Davies, is investigating conditions, and is to decide at an early date. His decision will be accepted by both sides.

Tombstone.—It is reported that material for the new mill at Douglas for the Phelps-Dodge Corporation is arriving daily, and that tests of the various manganese ores from Tombstone have proved satisfactory.

CALIFORNIA

Atascadero.—A large deposit of manganese has been discovered near this place in San Luis Obispo county. It occurs in serpentine, near a jasper formation. Two or three miles away is some chrome. The manganese is 8 to 10 ft. wide, and the outcrop has been traced 300 ft. It is 5 miles from rail, and a mile of road will have to be constructed. G. W. Cross is to take charge.

French Gulch.—The Crystal Creek power-house of the Hazel Creek Gold Mining Co., 8 miles from French Gulch, was destroyed by fire on June 27. The loss is $30,000. A short circuit was probably the cause. French Gulch and Tower House will be without power and light until the power-house is restored or until connection can be made with the Northern California Power Co. lines at the Gladstone mine.

Kennett.—On June 23 the 1000-ton ore-bins of the Mammoth Copper Co., at the lower end of the gravity train, were destroyed by fire. The loss is given as $10,000, but deliveries of ore from the mine to smelter will be stopped until the new bin under construction is completed.

Redding.—The hull of the American Gold Dredging Co.'s new boat on the Reid Ferry farm, across the river from Redding, will be floated in three weeks. It will take three or four months more to equip the craft. W. C. McBurney is superintendent of construction.

Valley Springs.—Lyons & Ward are shipping a car of chrome per week from this railroad terminus.——McAfee is also shipping some from here. The serpentine belt, in which the ore is found, is only a few miles distant.

Weaverville.—The Lagrange hydraulic mine will have to shut-down early in July on account of shortage of water. This has been the driest season for years.

COLORADO

Creede.—The Monon property, three miles from this place, is said to be the largest silver mine in the State. It is owned by the Monon Mining Co., but is being developed by lessees, A. M. Collins and Horace Wheeler. Ore was discovered on November 4, 1917. The shoot so far is 75 ft. long, 28 ft. wide, and assays from 40 to 200 oz. per ton. One hundred cars of ore returned $173,440. The present output is a carload daily. The property was first worked in 1891, and has been leased to various syndicates since.

Georgetown.—The new mill of the Colorado Central Mining Co. is working, dressing silver-lead-zinc ores.

Telluride.—Included in the Tonopah Belmont Development Co. of Nevada report for 1917 is a statement of operations of the Belmont Wagner Mining Co., which has an option agreement with the Wagner Development Mining Co. on its properties in San Miguel and San Juan counties. John M. Fox is superintendent.

The mineral holdings aggregate 124 claims. The property of present greatest importance is known as the Alta group, 4 miles in a south-westerly direction from Telluride. Other properties are in or near Silverton. Prior to acquisition by the Belmont, the Alta vein, a narrow but extremely persistent lode, with a reported past gross production of $1,500,000, had been developed by a series of tunnels aggregating 10,500 ft. in length. The lowest or 5th level followed the vein from surface for 3600 ft., and this, the furthest advanced of the levels, is yet some 500 ft. from the end line of the property. The greatest part of the ore

occurring between No. 5 level, and to a height of 180 ft. above No. 2 level, had been extracted, but the remaining undeveloped vein area between the upper workings and surface is extensive, the vein croppings on Silver mountain rising to a maximum height of 850 ft. above the uppermost workings. The previous development of the St. Louis-Palmyra mine had been confined underground, chiefly to the St. Louis vein. On the St. Louis vein, four levels, aggregating 4500 ft. in length, have been driven, and the lowest of these, No. 4, which followed the vein for 2000 ft. was, roughly, 2500 ft. from the property line. The vein outcrops reach a maximum height of 1650 ft. above No. 4 level, or somewhat over 1000 ft. above the uppermost vein workings. While extensive stoping has been done above the several levels, a considerable reserve tonnage of ore, the present principal value of the mine, remains blocked out, and a large further tonnage is indicated. The former

owners of the property had planned a lower tunnel for the extraction of ore below the lowest workings of the St. Louis and Alta veins, and this, the Blackhawk tunnel, had been started—from a point on the level of the upper floor of the old mill, and 400 ft. below the lowest vein workings—and had been driven 600 ft. For the deep development of the St. Louis vein 4400 ft. of further tunnel work is necessary, and 8000 ft. of still further work will be necessary to develop the other promising veins at this horizon. The early resumption of the driving of this Blackhawk tunnel was decided upon. George H. Garrey, consulting geologist, in a report dated August 1, 1917, summarizes the ore tonnages and values as follows: In the St. Louis vein, 90,987 tons of 'positive' ore, 43,947 tons of 'very probable' ore, 21,431 tons of 'probable' ore, 81,240 tons of 'possibly-indicated' ore, a total of 237,786 tons, of an average value of $10.96 per ton, and a gross value of $2,603,131. In the Alta vein, below the 5th Alta level, 13,604 tons of 'positive' ore, 34,010 tons of 'probable' ore, and 20,406 tons of 'possibly-indicated' ore, or a total of 68,020 tons averaging $11.13, and a gross value of $757,063. In the minor blocks of ore in the Alta vein between No. 5 and 1 levels, 4308 tons valued at $11.13, and a gross value of $47,948. The total reserves in the St. Louis and Alta veins, of all classes, are 310,114 tons averaging $10.99 per ton, and $3,408,142 gross. All values are calculated with gold at $20, silver at 70c., lead at 5c., and copper at 20c. In addition to reserves in place in the veins, there are impounded tailings estimated as follows: 130,000 tons of Alta tailing worth $3.70 per ton, 20,000 tons at $10 per ton, 150,000 tons at $4.54 per ton, and 25,000 tons of St. Louis tailing at $4.50 per ton. For an adequate financial return from the investment, and because the developed ore-reserves seemed to warrant it, the installation of mining and milling equipment for a daily capacity of 300 tons was decided upon for immediate installation. An entirely new mill was considered, but because the best situation was occupied by the existing old mill, and because a part of the old mill building could be made available for housing the new plant, it was decided to remodel the old structure, wrecking parts of it and erecting additions where necessary. New bunk and mess-houses for the men, store-houses and offices, cottages for married employees, etc., were planned.

The process to be used may be followed from the accompaning flow-sheet. Production was expected to start by June 1.

Westcliffe.—The Westcliffe Mining & Milling Co. is erecting a mill at its mine, using the Koering cyaniding process. A start will be made with one Koering recovery-drum, equal to 60-ton capacity. The drum is being made by the Koering company at Salt Lake City, and will be ready for shipment about July 1. A. L. deSpain of Denver is consulting engineer for the Westcliffe company and will be in charge of the installation.

IDAHO

Wardner.—After being a heavy lead and silver producer continuously since 1889, the Last Chance mine has reverted to the Bunker Hill & Sullivan company. This arrangement settles the apex dispute fought in the courts several years ago. By agreement the Federal Mining & Smelting Co., which owned the Last Chance mine, received 28,000 shares of Bunker Hill & Sullivan, and was given the right to work the Last Chance until the end of a period of five months, during which time the company operated at a loss. The Bunker Hill property surrounds the Last Chance. Immediately upon closing down the latter the Bunker Hill offered jobs to all of the old employees.

KANSAS

Baxter Springs.—This district in 1917 produced 10,184 tons of blende and 596 tons of lead, valued at $698,270. The field only entered the producing list of the region last year. There are now four mills in operation, six others nearly complete, and by end of 1918 it is expected that twenty will be dressing ore. Baxter Springs has for many years been the leading agricultural town in the south-east corner of Kansas. Farmers for miles around made it their shipping and trading point. Because of the business thus derived Baxter Springs grew to be a substantial city, gaining in wealth and civic improvements. The discovery of great mineral deposits in the adjacent territory has brought a great transformation in the town, which now has a population of over 7000 people.

MICHIGAN

Houghton.—Production of copper during June will exceed that of May by at least 1,000,000 lb. The most remarkable feature about the whole situation is the fact that the mines are increasing outputs steadily, and are not taking on many new men. Miners are getting more pay, particularly those working on contract. May was a good increase over April, at some mines 25% more, with the number of men at least 25% from normal. The increase is

due to greater labor efficiency. April saw a decided exodus of men. Many of these men moved away because of the prohibition law; many moved as is customary in the spring. The falling-off was noticeable in January, but did not assume large proportions until April. Up to that time the departure of men was normal. The increase in output for May and the still greater increase for June is credited to prohibition in this State. Men now work every shift. Those on contracts have made very high wages. The number of accidents has already been reduced to a low figure.

During May the Seneca Copper Co. sank its shaft 208 ft., which is fast work.

MISSOURI

Joplin.—Production of the region last week was 7044 tons of blende, and 1704 tons of lead. The average value was $51 and $94 per ton, respectively, making a total of $525,585. Missouri contributed $150,040.

MONTANA

Butte.—On June 28, Judge Bourquin of the District Court issued an order releasing all moneys of Butte & Superior tied-up under the order of October 3, 1917, resulting from its suit with Minerals Separation over the flotation patent. Several millions are held, so resumption of dividends is probable.

Corbin.—The Alta mine, 1200 ft. deep, is being unwatered. Water is pumped to surface through the Hewett shaft. A new drift was driven from the shaft under old workings and the water tapped by five diamond-drill holes. Copper ore is expected to be found in place of the great deposit of silver-lead ore mined in the past, said to have yielded many millions of dollars.

Iron Mountain.—On its 400-ft. level the Intermountain Copper company has opened 6 ft. of 12% ore for a length of 200 ft. A. I. Goodell is the new manager.

Jardine.—A shipment of chrome ore from the Jardine Gold M. & M. Co. in Park county recently netted $25,674. Settlement was at the rate of $24.50 per unit.

Kendall.—The Barnes-King company has acquired under lease the Mt. Pleasant gold prospect near its Shannon mine. The new property is considered very promising.

Wickes.—Mt. Washington mine is sending to smelter 75 tons of silver-lead ore daily. Ore is hauled in wagons to Wickes, 2½ miles, where it is shipped on Great Northern cars to the East Helena plant.

NEVADA

Belleville.—The Belleville Tailings Association has finished treating the old mill tailing here in Mineral county and ceased operations. F. C. Beedle was manager.

Goldfield.—Miners employed by the Goldfield Consolidated, Atlanta, and other companies have gone on strike, demanding $4.50 per day, or $4 and a 10% discount on all supplies bought from the company store. The present scale is $3.50, with a discount of 5% on supplies bought. The Silver Pick, Red Hill, and other properties are operating on a $5 scale.

Orizaba.—The Orizaba silver mine in Nye county is now controlled by C. S. Sprague and others, who control the Diamondfield Black Butte company of Goldfield. The mine has yielded ore worth $75,000 from above the 85-ft. level. Large quantities of ore are said to be in the mine and on dumps.

Pioche.—The new 3-compartment shaft at the Prince Consolidated is almost finished, and the hoist and compressor are being erected.

Tonopah.—The weekly production of the district remains around 10,300 tons, valued at $175,000.

The Extension treated 10,464 tons in May, yielding 1003 oz. of gold and 101,182 oz. of silver, giving a profit of $39,727.

Dividends declared are as under:

Company	Amount per share, cents	Total amount	Date
Belmont	10	$150,000	July 1
Jim Butler	7½	128,852	
Tonopah Mining	7½	75,000	July 2

The East Divide Mining Co., composed of Tonopah and Goldfield operators, has purchased the Merced claim east of the Tonopah Divide mine at Gold Mountain. Surface indications are said to be favorable for ore.

OKLAHOMA

Picher.—Production of Oklahoma districts last week was 4975 tons of blende and 1247 tons of lead, valued at $372,245.

A 500-ton mill of the Commonwealth Lead & Zinc Co., valued at $100,000, and out of operation since February, was burned on June 18.

Quapaw.—West of this place water is a hindrance to mining, and a number of mine-owners are co-operating to drain the area. The Muskogee, Imperial, St. Louis, and others are interested.

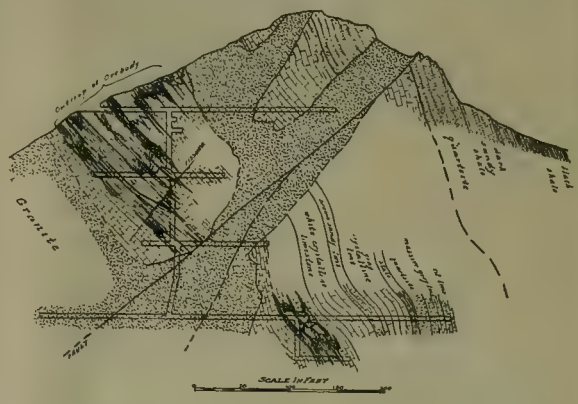
Tar River.—The Maxine company is to let a contract for a 400-ton gas-driven concentrating plant. Twenty-six drill-holes show fine ore at a depth of 205 ft., the face being 35 ft. high. W. C. Miller is superintendent.

TEXAS

Sierra Blanca.—Large pockets of high-grade wulfenite have been found by the Quitman Mining & Milling Co., eight miles west of here. When a process is devised a plant will be erected to dress the ore.

UTAH

Gold Hill.—In 'Economic Geology' for June the Gold Hill district of Tooele county is described by J. F. Kemp and Paul Billingsley. The Gold Hill is the principal mine of the Clifton district, and is shipping copper ore regularly to the



EAST AND WEST CROSS-SECTION OF GOLD HILL MINE, UTAH

smelter at Tooele. It is owned by the Western Utah Copper Co. The relation of the Gold Hill ore deposits to the general geological features of the district appears in the accompanying sketch. A rim of sedimentary rocks, mainly limestone, surrounds an inner basin of granite. To the north, at Dutch mountain, and to the south, at Montezuma peak, this rim rises to 8000 ft. or more. The granite itself forms no eminences, but residual fragments of its sedimentary cover stand up in irregular groups of hills. From the contacts now exposed it is evident that the intrusive top of the granite was nearly flat, and it is further apparent that the

present erosion surface throughout the inner basin nearly coincides with this plane. The more deeply incisive valleys are all in granite, while the hilltops are always sedimentary rock. Gold Hill is the southern termination and highest point of a ridge of such sedimentary formation, which extends as an easterly dipping belt of well-defined limestones, quartzites, and shales from the east flank of Dutch mountain for several miles to the south-east. The ridge is underlain by granite, which appears on both slopes, and it may be regarded as a roof-pendant partly submerged in the intrusive rock. The orebodies of the Gold Hill mine are found within the limestone member of the succession, at a point where it is most intricately cut and enveloped by the intrusive granite. They are not immediately associated with the contacts. Occasionally a contact will exhibit a little cupriferous pyrite intergrown with quartz, calcite, and garnet, but much unprofitable prospecting has demonstrated the small extent and low value of such occurrences. The important mineralization is found entirely within the limestone; and consists, at present, of porous iron oxides, carrying copper, and some lead, in the form of carbonates. No sulphides whatever remain, desert climate and hilltop location combining to carry complete oxidation below any levels yet reached in the mine. In all probability the original mineralization was of pyrite, chalcopyrite, galena, and sphalerite. Thus the Gold Hill ore deposits fall within a familiar and important group, that of the pyritic replacements of limestone near a granite or monzonite contact, a group found at its widest development in the Warren district, Arizona. It is a representative of this group that the Gold Hill orebodies are chiefly of interest, for in occurrence and mineralogy they have few unusual features.

Milford.—The old Lincoln lead mine, 17 miles south-east, is to be drained by a 3700-ft. tunnel. The water will be used for irrigating good land nearby. A. McLease is in charge. A recent shipment of ore averaged 25% zinc, 10% lead, 1% copper, 5 oz. silver, and $1.20 gold per ton.

Park City.—The Daly Mining Co. paid 10c. per share, equal to $15,000, on July 1. This makes $30,000 for 1918, and $3,015,000 to date.

CANADA

British Columbia

Cascade.—The chrome deposits near Laurier on the International boundary have been purchased from R. Wolverton by W. J. Nicholls and others of Spokane. A considerable quantity of ore is said to be available.

Grand Forks.—On August 1 Granby Consolidated pays a 2½% dividend. This is equal to $374,962, making $10,198,895 to date.

Kamloops.—For the further instruction of prospectors, also to induce the location and development of the rarer minerals in the Province, the Hon. Wm. Sloan, Minister of Mines, has authorized the Department of Mines to secure complete exhibits of these minerals and arrange for their display in the centres of the six mineral survey districts into which British Columbia has been divided. The first of these exhibits has been opened by R. W. Thomson, at Kamloops. There will be others at Nanaimo, Prince Rupert, Hazelton, Revelstoke, and Grand Forks.

Kaslo.—Permission has been secured from the Dominion government for the export from Canada to the United States of 5000 tons of manganese ore. The license applies particularly to the Curle property, near Kaslo, which has been opened recently and already has a considerable quantity ready for shipment.

Revelstoke.—The International Mining Convention of the Pacific North-West will be held here in July of this year. The arrangements include unusual and pleasant outings.

PERSONAL

Note: The Editor invites members of the profession to send particulars of their work and appointments. This information is interesting to our readers.

J. K. Turner of Goldfield is here.

H. Foster Bain is expected here this week.

F. W. Bradley spent the week-end at Atolia.

Charles W. Goodale has been in San Francisco this week.

Hennen Jennings received an honorary degree from Harvard University on June 20.

Guy C. Riddell was here last week as metallurgical adviser to the U. S. Tariff Commission.

Forbes Rickard has returned to Denver from the inspection of mines near Sumpter, Oregon.

Edwin E. Chase has gone from Denver to Wickenburg, Arizona, to examine a mining property.

J. S. Diller, of the U. S. Geological Survey, is in California investigating the chrome situation.

Walter S. Brown is now in the research department of the New Jersey Zinc Co. at Pemberton, New Jersey.

A. F. Kuehn has changed his name by legal procedure to Amor Frederick Keene. He is now at New York.

William R. Jones is now manager, at Tavoy, in Burma, for the High Speed Steel Alloys Mining Co., Ltd.

A. L. Queneau, who has seen active service with the French army, is now engaged as metallurgist in England.

William C. Russell has just returned to Denver from an examination of the oil-shale fields of north-western Colorado.

F. L. Ransome, of the U. S. Geological Survey, attended the hearing before the U. S. Tariff Commission in San Francisco.

Earl T. Stannard, manager for the Kennecott Copper Corporation, was married to Miss Jeannette Condon on June 11 at New York.

A. Stansfield, of McGill University, Montreal, is in California investigating electric smelting of iron ore for the British Columbian government.

E. Harms, after sixteen years service with the Cia. Metallurgist de Torreon, Mexico, as manager and metallurgist, has resigned and is now at El Paso, Texas.

Among the experts retained in the Utah Apex v. Utah Consolidated Apex suit are **W. H. Emmons, Waldemar Lindgren, George B. Wilson,** and **W. A. Wilson.**

John Sloan Stewart Jr., who was erecting the lead smelter for the Irtysh Corporation at Ekibastus, in Siberia, passed through San Francisco on his way to Mansfield, Ohio.

J. Volney Lewis, professor at Rutgers College and the University of New Jersey, will devote a considerable part of the summer to professional work in the southern Appalachians.

C. B. Clyne has been engaged as constructing engineer for the Compañia Minera del Mirasol, which is operating the mines for the Cusi Mining Co., at Cusihuiriachic, Chihuahua, Mexico.

H. W. Bell has been appointed Deputy State Oil and Gas Supervisor for the Third district, which includes Santa Barbara and neighboring counties. Mr. Bell has been on the State Mining Bureau staff for some time as inspector and engineer.

W. H. Parker was drowned while swimming the Sun river in Montana on June 22. He was only 27, a graduate of the Montana School of Mines, and had been working as a sampler in the Berkeley mine at Butte. He had been appointed recently safety engineer at the Great Falls Reduction Works of the Anaconda company.

THE METAL MARKET

METAL PRICES

San Francisco, July 2

Aluminum-dust, large and small lots, cents per lb	65—70
Antimony (wholesale), cents per pound	15
Copper, electrolytic, cents per pound, in carload lots	23½
Copper, electrolytic, cents per pound, in small quantities	24⅝
Lead, pig, cents per pound	8.15— 9.15
Platinum, Government price, per ounce	$105
Quicksilver, per flask of 75 lb	$120
Spelter, cents per pound	11
Zinc-dust, cents per pound	17½

'Antimony in 1916' has just been published by the U. S. Geological Survey. This country produced 4500 tons of 40% ore, valued at $40,580. Imports were 4742 tons of metal in ore and 9874 tons of metal in all forms. See page 899 of the 'Press' of June 29 for the antimony situation in June 1918.

ORE PRICES

July 2

Antimony, 45% metal, f.o.b. California, per unit	$1.10
Chrome, 38 to 48%, California, per unit	$1.25—$1.50
Magnesite, crude, California, per ton (nominal price)	$7.00—$8.00
Manganese, domestic, 35 to 54%, f.o.b. South Chicago, per unit (Government price, effective May 29)	$0.86—$1.30
Manganese, domestic, 35 to 54%, f.o.b. east of South Chicago, per unit (Government price, effective May 29)	$1.01—$1.45
(Manganese, domestic, penalty of 50c. to $1 per ton for 8% and up to 25% silica, and bonus of 50c. to $1 for less than 8 and 5%.)	
Molybdenite, per lb., 90% MoS_2	$1.25
Pyrite, per unit of sulphur, cents	28
Tungsten, 60% WO_3, California, per unit	$24

Tungsten, as discussed before the U. S. Tariff Commission at San Francisco, will be found on page 5 of this issue.

EASTERN METAL MARKET

(By wire from New York)

July 2.—Copper is unchanged. Lead is quiet but strong. Spelter is inactive though higher.

SILVER

Below are given official (not Government) quotations, in cents per ounce of silver 999 fine. In order to make prompt settlements with smelters and brokers, producers allow a discount from the Government price of $1, hence the lower price. The Government has not fixed the general market price at $1, but will pay this price (as from April 23, 1918) for all silver purchased by it. The equivalent of dollar silver (1000 fine) in British currency is 46.65 pence per ounce (925 fine), calculated at the current rate of exchange.

The U. S. government has ceased buying silver for the time being. Large quantities were purchased during the past few months. The Philadelphia Mint is reported to be melting 1,200,000 silver dollars daily. Silver certificates outstanding on June 20 were $392,668,956, compared with $439,960,611 on May 1.

COPPER

On September 21, 1917, the Government fixed copper prices at 23.50c. per lb. for large lots, and 24.67½c. for small lots, effective until June 1, 1918. On this date the prices were re-fixed until August 15, 1918. Quotations in cents per pound are as under:

Lead ore, basis of 80% metal, is quoted at $95 per ton at Joplin, Missouri.

ZINC

Zinc is quoted as spelter, standard Western brands, New York delivery, in cents per pound. On May 25, 1918, the Government fixed prices until September for grade A spelter at 12c. per lb. for itself and the open market. Lower grades can make their own prices as usual. Sheet-zinc is fixed at 15c., and plate at 14c. per pound.

Zinc ore is $5 per ton stronger at Joplin, Missouri, second grades selling at $51.

QUICKSILVER

The primary market for quicksilver is San Francisco, California being the largest producer. The price is fixed in the open market, according to quantity. The Government is taking 40% of the United States quicksilver output, paying therefor $105 per flask. Outside of this business the competitive market can make any price as usual. Prices, in dollars per flask of 75 pounds:

Eastern Metal Market

New York, June 26.

Quotations, except those for fixed markets, are generally higher than a week ago, and all the markets are strong.

Copper conditions are unchanged at Government prices, with demand on the increase.

Tin is quiet, due to uncertainty as to the effect of the new freight rates.

Lead is strong, but is under control at an agreed maximum price.

Zinc is moderately active, and higher in restricted offerings.

Antimony is quiet and unchanged.

The principal news in the steel market is the result of the meeting at Washington on June 21, on new steel prices for the third quarter. No changes were authorized except on iron ore, which was advanced 45c. per ton to $5.50, effective July 1. Merchant producers of pig-iron hoped for and claimed that they needed an advance on account of increased freight charges, but they were disappointed. With this exception the decisions were satisfactory in the main. The entire industry is on a war-basis, with distribution solely in the hands of the Government.

COPPER

The demand for copper continues large, with that for war-uses on the increase, and less available for strictly domestic use. While the smelter output will probably continue to increase, it is the opinion in the trade that it will be some time, perhaps several months, before this will be reflected in the output at the refineries. The question of price is still prominent. The belief and hope that an increase will be granted not later than August 15 on the present 23.50c. price still holds. Increased freight charges went into effect yesterday, and while the effect of this will not be felt at once, the ultimate result is claimed to be an increased cost of at least 1c. per pound. It is understood that the War Industries Board is about to review the recent decision of the Price-Fixing Committee, but it is hardly probable that this will be finished before the end of July. It has been pointed out that no copper has at any time been sold at less than the maximum price of 23.50c. per pound, which would seem to prove that there is a real scarcity. This is perhaps all the more true when it is realized that grade A zinc has been sold repeatedly at less than the maximum price of 12c. per pound. It is stated that the maximum jobbing-lot price of 24.67½c. per pound for copper has been shaded to 24.50c. Exports of copper in May are reported as 28,889 tons, compared with 49,245 tons in May 1917. The total to June 1, 1918, has been 150,995 tons, against 233,586 tons to June 1, 1917. This is a decrease of 33%.

TIN

The market continues decidedly quiet. One cause is the question of the effect of the new freight rates. This uncertainty has checked trading. Much of the tin now comes by way of the Pacific Coast, and, as most of it is consumed in the East, the question of freight is important. The new rate is reported to be $1.25 per 112 lb. from the Pacific Coast to New York, but this is not yet settled. A rate based on the value of the shipments may prevail, in which case it would be $2.81½. Rumors of a price-fixing policy are not seriously considered, and there is nothing definite regarding this. The spot price is maintained at 92c., New York. A steamer from the Orient, with 750 tons of Banca tin, has reached San Francisco. Already in June over 3000 tons has arrived at Pacific ports and 480 tons at Atlantic ports, and there is 5000 tons estimated to be afloat. The London market has changed little in the week.

LEAD

The market continues strong, and if given full rein it would probably advance to considerably higher levels. Prices, however, are the same as a week ago, or 7.75c., St. Louis, and 7.82½c., New York. The larger producers have mutually agreed, it is understood, on a maximum price of 7.75c., St. Louis, fearing, or perhaps realizing, that otherwise a maximum price will be fixed by the Government. Demand is strong, and this in normal times would create a runaway market, for the supply of lead is not equal to the demand. The requests for deliveries during the summer are reported as calling for probably more lead than can be supplied. According to the New York Metal Exchange the monthly price for lead in May 1917 was 10.91½c. per pound, contrasted with 7.10½c. for May this year.

ZINC

Since last week the market has continued to gain in strength, owing to various causes. On June 25 prime Western was quoted at 8.25c., St. Louis, or 8.50c., New York, an advance of ⅝c. per pound in the week covered by this letter. This is for June and July deliveries. For third quarter the quotation is 8.37½c., St. Louis, or 8.62½c., New York. This situation is due largely to the scarcity of offerings whenever any bids are made, the latter buying but little metal, a situation that has prevailed now for some time. Quotations as high as 8.75c., St. Louis, have been heard of. The entire situation is a strong one from the producer's viewpoint, and promises to continue so for a time at least. All Western smelters report trouble with labor, as well as serious operating conditions due to the excessive heat in the regions lately.

ANTIMONY

Chinese and Japanese grades are quoted at 13 to 13.12½c., New York, duty paid, with 13.25c. asked for small lots. The market is quiet.

ALUMINUM

No. 1 virgin metal, 98 to 99% pure, in 50-ton lots, is fixed by the Government at 33c. per pound, while for lots of 15 to 50 tons, 33.10c. is established, with 33.20c. fixed for lots of 1 to 15 tons. Scrap prices are on the same basis.

ORES

Ferro-manganese: The Anaconda Copper Mining Co. expects to begin making ferro-manganese in August. Its output, when at capacity, is expected to reach 30,000 tons per year by the end of 1918.

Iron: As mentioned above, the price of iron ore has been increased 45 cents per ton; following are the prices over a number of years:

Year	Per ton	Year	Per ton
1908	$3.50	1914	$2.85
1909	3.50	1915	2.80
1910	4.00	1916	3.55
1911	3.50	1917	5.05
1912	2.85	1918 (new prices)	5.50
1913	3.40		

Molybdenum and Antimony: There have been no developments reported, and prices are unchanged and nominal at the levels last quoted.

Tungsten: The market is quiet and nominal at $20 to $24 per unit in 60% concentrates, and with off-grades sold at concessions under these levels. Ferro-tungsten is quiet but strong at $2.35 to $2.40 per pound of contained tungsten.

INFORMATION FURNISHED BY MANUFACTURERS

COMMERCIAL PARAGRAPHS

The St. Bernard Mining Co., Earlington, Kentucky, has increased its capital from $1,000,000 to $1,500,000 for extensions in operations.

The National Aniline & Chemical Co., Buffalo, is having plans prepared for the construction of a new eight-story extension, about 145 by 225 ft., to cost $40,000.

The Constitutional Lead & Zinc Mining Co., North Century, Missouri, plans to increase the capacity of its milling plant near Joplin from 250 to 500 tons per day. William S. Rogers is president and general manager.

The Rachel Coal Co., Mannington, West Virginia, is planning for the erection of a new power plant and compressor works, to replace the structures recently destroyed by fire. A new ventilation system will also be installed at the mines.

The Midvale Steel & Ordnance Co., Widener Bdg., Philadelphia, Pennsylvania, is planning for the construction of a large new plant at its Nicetown works, to be devoted to the production of large guns and kindred products for Government use.

The Ferguson Steel & Iron Co., 1399 Bailey avenue, Buffalo, New York, will commence work at once on the construction of a new one-story steel addition, about 50 by 200 ft., to its plant on Stanley street. Plans for the structure have been filed.

The Lancaster Minerals & Mining Co., Lancaster, Pennsylvania, has been incorporated with a capital of $500,000 to operate lands containing ores and minerals. Harry B. Cochran, W. Frank Gorrecht, and John F. Smith, Lancaster, are the incorporators.

The Central Smelting & Refining Co., Rider avenue, New York, has commenced the construction of a new smelting plant on Borden avenue, Long Island City, to cost about $50,000. It is proposed to rush the erection and place the works in operation at an early date.

The Ozark Mining & Milling Co., Yellville, Arkansas, recently organized, is planning for the immediate installation of a new 100-ton concentrating mill at its lead and zinc properties. E. T. Stinchcomb, of Lehigh, Oklahoma, is president, and E. E. Scofield, Yelville, is engineer.

The Maryland Chrome Co., Baltimore, Maryland, is considering the installation of a quantity of new machinery and equipment at its chrome properties near Towson, Maryland, to increase the present capacity. The company now has under development about 1000 acres. Frederick A. Dolfield is president.

The Connecticut Zinc Co., operating near Cave City, Arkansas, has acquired about 2000 acres of manganese property along Cave creek, and plans for extensive operations for production and marketing of the material. It is proposed to build a concentrating plant and to install a number of steam-shovels. G. A. Williams is in charge.

Announcement has been made by the management of the **Aetna Chemical Co.** of the acquirement of property comprising about 500 acres at Mount Union, Huntingdon county, Pennsylvania, as a site for the erection of a large new plant to replace the works at Oakdale, recently destroyed by fire. Construction on the new plant will be commenced at once. It has been decided to abandon the site at Oakdale.

The Fairmont By-Products Corporation, Fairmont, West Virginia, is drawing plans for the erection of new coke works, using by-product coke ovens. The initial plant is estimated to cost about $1,500,000. The company was recently incorporated with a capital of $500,000 by O. F. Lough and C. E. Smith.

The Donner Steel Co., Buffalo, New York, operating a plant on Abbott road, is planning for the erection of a large coke works to be devoted exclusively to production for the Government. The plant is near Beacon street, adjacent to the present steel works. A new one-story addition to the steel works is now being erected, to cost about $50,000.

The Commodore Fluorspar Co., Hopkinsville, Kentucky, recently incorporated with a capital of $60,000, is planning for the operation of a plant for the production of fluorspar. An output of about 2000 tons will be made during the present year. The new organization will be under the management of the Southern Mineral Co., E. V. Rawn president.

The Curtis Bay Copper & Iron Works, Curtis Bay, Maryland, is planning for the immediate erection of three new buildings for the manufacture of copper and iron specialties, castings, etc. Plans for the structures, which will be about 60 by 110 ft. each, are now in course of preparation. The company has recently been incorporated with a capital of $1,000,000, the main office being at South Baltimore. William F. Cochrane is chief engineer.

The Princess Iron Corporation, Philadelphia, Pennsylvania, has been organized with a capital of $3,300,000 under the ownership of Frazier & Co., Broad street, Philadelphia. The company will acquire the properties of the Princess Furnace Co., Circle Ore Co., and Callie Mining Co., in the Glen Wilton district, Virginia. The blast-furnace has a daily capacity of 100 tons of high silicon-pig. With two brown hematite iron-ore mines, and over 1400 acres of land in this section, the company will engage in extensive operations, and is considering plans for development.

Meese & Gottfried Co. of San Francisco have issued a descriptive booklet dealing with the Meeseco belt-drive, which consists in the proper application of special resilient idler pulley, admitting of the use of short-centre belt-drives in many cases where speed-chain drives were formerly employed. It saves space, length of belt required, and reduces the width of belt as much as 30%. There are many other advantages, which are fully described with the aid of illustrations. It is a handsome catalogue, and gives instructions and diagrams covering the use of this appliance.

The Sullivan Machinery Co. calls attention to its 'DR-6' mounted water-hammer drill in a bulletin 70-H, which gives details of construction and operation of this equipment, with illustrations showing its application above and below ground.

The Ingersoll-Rand Co. has just issued a bulletin on equipment for sugar factory and refinery service. It is handsomely illustrated.

DRY PLACER MINING

In the desert country of Arizona where no water is available, the Sauerman dragline cableway excavator is making a record in the economic handling of dry placer material.

In all classes of dry excavating, as well as under water, the Sauerman cableways are handling material cheaper than is possible with any other form of excavator for this class of work.

For Placer Mining, either wet or dry, Sauerman excavators afford the ideal means for dredging and handling gravel and dirt.

FOR HANDLING LARGE TONNAGE

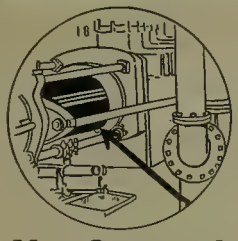
It is not economical with many placer properties to equip with expensive dredges for handling material.

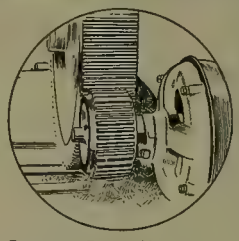
Sauerman excavators afford the means of handling materials at an installation cost that is insignificant as compared with that of the gold, platinum and tin dredges.

Let us send you a description of a dry placer property's equipment which affords one of the most difficult types of placer operations where a Sauerman excavator is in successful operation.

SAUERMAN BROTHERS, 1141 MONADNOCK BLOCK CHICAGO, : : ILLINOIS

Manufacturers of Cableway Excavators, Power Scrapers and Cableway Accessories.





Use Grease that has the "Vital Element" in it

Graphite is recognized the world over as the ideal lubricant, because of its characteristic way of forming a frictionless veneer over rubbing surfaces.

DIXON'S
Waterproof Graphite Grease

is composed of high-grade mineral stock and selected Flake Graphite. In addition to its excellent lubricating qualities, it is also very adhesive and is a sure rust preventative.

Because of these qualities Dixon's Waterproof Grease is the most economical and efficient grease on the market for pump plungers, heavy gears, wire ropes, chains, heavy rolls and bearings.

D X N TRADE MARK ESTABLISHED 1827 D X N TRADE MARK

GARRATT JACK HEAD PLUNGER PUMPS

Are Not Affected by
Muddy, Gritty Water

The cylinder has large clearance and the plunger is outside packed at the top. The suction and discharge valves are fitted with bronze taper seats and are easily exchanged by removing bonnets. The Jack Head works altogether on the down stroke; the pump rod is made to weigh just half the amount of pressure exerted on the plunger so that the load is equal and uniform at all times whether on down or up stroke. In this way

Balance Bob is Eliminated

thereby increasing the efficiency and materially reducing cost of installation. These pumps are made with capacities of from 30 to 500 gallons per minute and for elevations up to 600 feet.

W. T. GARRATT & CO.

Established 1850

299 Fremont St. San Francisco, Cal.

"Service" is the cry of '18

We are located here in the center of things, with twenty-five years experience and the largest stock of Mine, Mill and Smelter supplies in the southwest back of us and with an organization and facilities to give you the very best of service.

OPPORTUNITIES

Under this heading announcements may be made of new and second-hand machinery or supplies, for sale or wanted. The cost is five cents per word, including address. One dollar minimum order. Remittances MUST accompany order. Copy must be received by Saturday morning for the following week's issue.

CHROME ORE—Spot cash for chrome ore containing 30% or more chromic oxide. If you control deposits of chrome ore it is your national duty to produce the ore. Send sample with description of deposit. We will analyze such samples and contract for your output. The ore is used in the manufacture of firebrick for steel and metallurgical furnaces and is a war necessity. American Refractories Company, Samuel H. Dolbear, Consulting Engineer, 1412 Merchants National Bank Bdg., San Francisco, California. tf

FOR SALE—On easy terms, a large low-grade gold-silver property consisting of fifteen claims, located in Custer county, Idaho. Immense tonnage developed by over three thousand feet of drifts and cross-cuts. Other minerals, bismuth and wolfram. Write or wire. R. D. Leach, Box 300, Pocatello, Idaho. 7-13

WANTED—A twelve-pipe Johnson-McKay quicksilver retort. Must be reasonably near transportation. Black Butte Quicksilver Mine, Black Butte, Oregon. 7-20

FOR SALE—Thin metal and tin scrap. A substitute for heavier metal scrap as precipitant or smelter flux. Large quantity for immediate delivery. Contracts for large or small quantities. Can load cars to capacity. Price on application. H. D. Staley, 132 Lick Bdg., San Francisco.

WANTED—Hauling contracts anywhere. Seven years experience with auto trucks in mountains and deserts. Can handle any proposition. California Auto Trucking Co., 860 Waller St., San Francisco. Phone Park 5426. tf

FOR SALE—One 4-ft. SENN BATEA AMALGAMATOR, Bul. 41. Has not been unboxed and never used. Sacrifice price. New in San Francisco. Address Excelsior Gold Mines Company, Forest Hill, California. 7-6

FOR SALE—One hundred ton concentrating mill, crusher, rolls, jigs, trommels, Wilfley tables; also 2—9B, 1—7 and 1—5 Cameron sinker pumps. Address Box 668, Salida, Colorado. 7-20

FOR SALE—600 feet high-pressure pipe, double riveted, longitudinally designed, for 330-foot head; also 150 feet same pipe special bents. Pipe new and on railroad. Address P.O. Box 376, Grants Pass, Oregon. 7-20

WANTED—Gas engine, two or three cylinders, vertical preferred; 120 horse-power, for belt drive; California delivery. Address F. L. Sizer, 1006 Hobart Bdg., San Francisco, California. 7-13

FOR SALE—If you want a property that will develop into a great copper mine, with comparatively small outlay of capital, I have it. Address John Slak, Mayer, Arizona. 7-13

FOR SALE—Several gasoline hoists, 2-3-4-6-8 hp.; several belt, steam and electric hoists, water wheels, crushers, rolls and other machinery. U. S. Iron Works, Seattle, Washington. tf

WANTED—Silver or gold property with positive demonstrated tonnage commercial ore. Full particulars will be appreciated. Address Opp. 859, Mining and Scientific Press. tf

90 H. P. GAS ENGINES

Two 90 h.p. Western Distillate Duplicate Engines equipped to burn tops; with friction clutches and Bosch magnetos. Installed one year ago, used 60 days; equal to new in every respect. Immediate delivery central Arizona points. Can furnish either generators or compressors and make complete power plants.

SOUTHWESTERN WRECKING CO.
El Paso, Texas

ORES AND MINES

We are in the market for Western ores and mines of manganese, molybdenum, tungsten, vanadium and chromium. Submit analysis, estimates of quantities available, engineer's reports and maps. Blank forms supplied on application. R. M. R. Co., 629 Citizens National Bank Bdg., Los Angeles, California. tf

SOME TIMELY BARGAINS
IMMEDIATE DELIVERY

TUBE MILLS

2—6 ft. diam. x 10 ft. long, Allis-Chalmers Mills. Herringbone gears. El Oro lining. Designed for motor drive, but can be belted. Can be converted into ball mills by changing to chrome steel lining. In good condition. Offered at an exceptionally low price.

PIPE

6—Miles 4 ″ standard black pipe
3— “ 3 ″ “ “ “
3— “ 2½″ “ “ “
5— “ 2 ″ “ “ “

ALTERNATORS

Complete Cyanide Mill
Hoisting and Surface Plant

We offer for sale the complete 200-ton mining, milling and surface plant and equipment of the NEVADA HILLS MINING COMPANY, at Fairview, Nevada

This was considered the most complete plant in the State of Nevada, and briefly stated consists of

Structural Steel Mill Building
Asbestos Protected Metal Covering
Steel Gallows Frame, Skips and Cages
Steel Ore Bin and Air Lifts
150 H.P. Electric Hoist
200 H.P. Electric Compressor Plant
20x12 Blake Crusher
20 Stamps—1200 lbs.
Tube Mills
Concentrating Tables
Akins and Cone Classifiers
Triplex, Duplex and Centrifugal Pumps
Dorr Thickeners and Agitators
32 Redwood Tanks
Refinery complete
Oliver Filters
Slime Conveyor
Air Compressors
Boiler Plant
Perrin Presses, etc.
33 Alternating Current Motors
12 Transformers

Stamp Mills

6 Stamp, 350 lb. Prospectors Tremain Steam Stamp, Practically New.
80—900 lb. Stamps, Mill Complete.
100—1000 lb. Stamps, Mill Complete.
20—850 lb. Stamps, Mill Complete.
Extra parts for Stamp Mills, All Makes.

Dorr Thickeners

3—33 Ft. Dorr Thickener Mechanisms with Redwood Tanks 12 Ft. Deep.
4—36 Ft. Dorr Thickener Mechanisms with Steel Tanks 12 Ft. Deep.
3—24 Ft. Dorr Thickener Mechanisms with Redwood Tanks 12 Ft. Deep.
2—24 Ft. Dorr Thickener Mechanisms with Wood Tanks 8 Ft. Deep.
2—18 Ft. Dorr Thickener Mechanisms Only.
1—22x8 Ft. Dorr Thickener.
2—18x10 Ft. Dorr Thickeners.

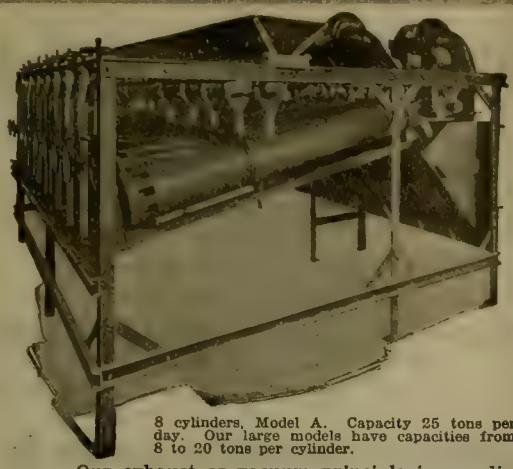
Dorr Agitators

3—Dorr Agitators with 20x20 Ft. Redwood Tanks.
3—Dorr Agitators with 18x15 Ft. Oregon Fir Tanks.
3—Dorr Agitators with 12x10 Ft. 8" Wood Tanks.

Dorr Classifiers

1—Dorr Duplex Classifier in Steel Tank.
2—Dorr Simplex Classifiers in Steel Tank.
1—Dorr Simplex Classifier, Extra Long, in Steel Tank.

THE MORSE BROS. MACHINERY & SUPPLY CO.
DENVER, COLORADO



8 cylinders, Model A. Capacity 25 tons per day. Our large models have capacities from 8 to 20 tons per cylinder.

The MEYER
DRY ORE CONCENTRATOR

A PROVEN SOLUTION OF THE DRY ORE CONCENTRATION PROBLEM

After years of experimental work on all the common and complex ores of Copper, Lead, Zinc, Tungsten, Iron, Silver, Molybdenum, Chromium, Manganese, etc., we are able to guarantee an average extraction of 85% and better of practically every kind of concentrating ores—whether Sulphides, Carbonates or Oxides—while over 90% is constantly being obtained on many ores.

Compare These Figures With What Your Mill is Doing

Our exhaust or vacuum principle is a radical departure from every other process of concentration. It is not only scientifically correct, but can be absolutely controlled to any desired suction, detecting the slightest difference in weight between the rock and mineral contents, producing a perfect separation and **Absolutely Dustless.**

Handles every size from largest to dust. Rotation of cylinders tumbles the ore and rock, the suction draws the rock upward farther with each rotation, while the heavier concentrates fall downward and out of the machine in a constant stream.

All metal construction. Add as many sections as desired.

Whether you have an abundance of water for wet concentration or are in the desert, the Meyer Dry Concentrator is worth your thorough investigation.

Send Us Prepaid: 10 lb. uncrushed run of ore; 20 lb. each of three sizes of crushed ore—coarse, medium and fine, as 16, 30 and 60 to 100 mesh; 15 lb. of unsized crushed ore. This saves unnecessary delay. Will return results—**Then You Know.**

Our catalog explains everything

THE NATIONAL MILLING & REFINING CO.

209 CITY NATIONAL BANK *Sole Manufacturers* **CANTON, OHIO**

ANOTHER EXAMPLE OF BYRON JACKSON RELIABILITY

This station pump is a self-contained unit, consisting of a twin six-stage centrifugal, direct connected to a steam turbine. It is fitted with flexible couplings and water-cooled marine-type thrust-bearings. It is pumping 450 gallons per minute against a head of 1560 feet, running at a speed of 2300 r. p. m. and requiring 300 horse power. It was placed in operation June 1, 1917, has been operating continuously since that date, often twenty hours a day for weeks at a time.

Submit your pumping problems to us. No obligation. Write today.

Half a century's western experience behind each box

For more than half a century Giant Powders have cut the cost of western blasting. From 1866, when first made near San Francisco, they have been constantly improved and perfected especially to meet western requirements.

For mining, quarrying, road or railroad work under western conditions, these explosives made in the west by a western company are naturally superior. A trial along side any other brand will show you that they do more and better work at less cost.

Be sure you get the genuine Giant Powders, product of the manufacturer who originated the name. The Giant trademark is on every case for your protection.

Meeting the Labor Shortage

FROM every mining section come reports of steadily decreasing man-power. Eventually YOUR mine will feel it. One aid to meet the situation is the

Pneumatic ROTARY DUMP

which requires only one man to operate. And which saves much labor in car building, car repairing and track cleaning. This Dump really helps to increase output. Write for Bulletin 170-P and facts pertaining to your dumping.

Straub Stamp Mill

AWARDED

GOLD MEDAL

PANAMA-PACIFIC INTERNATIONAL EXPOSITION

Our mills are made in three sizes —8-ton, 12-ton, and 20-ton—and are installed in all sections of the country, from Alaska to Central America. We claim a larger range of crushing than any other mill both in hardness of ore and size of screened product.

One man writes from a remote part of Central America, "I have operated the Straub Mill on every grade of ore from the very hardest quartz to clay, and find it all that any man could expect." He has one of our 8-ton mills, and says, "I am getting upwards of 18 tons on oxidized ore."

THE STRAUB STAMP pays for itself in the saving it makes over ordinary mills on transportation, erection, and operating costs. Two men can erect a STRAUB mill ready for operation in two days.

HANDBOOK OF ENGINEERING MATHEMATICS

BY

WALTER E. WYNNE, B.E.

AND

WILLIAM SPRARAGEN, B.E.

230 Pages **4¼x6⅞** **113 Diagrams**
Flexible Leather **Post Paid, $2.00**

The increasing need of mathematics in engineering assures this book a broad field of usefulness, not only to students in technical schools and colleges but also to practising engineers. In it the authors have endeavored to supply a handy means of reference to the theoretical and applied mathematics used in engineering, and while the first aim has been to make this a mathematical handbook, the book is of greater value because it includes the underlying engineering data and applications as well as the mathematical formulæ.

Intended primarily for students in engineering schools and colleges, it should however serve as a convenient reminder of things which are easily forgotten but are likely to be needed in their later work.

Send for our complete catalogue of Technical Books.

SMOOTH-ON ELASTIC CEMENT No. 3

Coat All Gaskets With Smooth-On No. 3

That's the whole secret of everlastingly tight joints—no matter what kind of line they are in or what kind of gasket you use.

If you want really superior gaskets for high pressure and superheated steam get SMOOTH-ON Corrugated Iron Gaskets. They are made of specially prepaired, flexible iron rolled in concentric corrugations and ready-coated with SMOOTH-ON No. 3. You simply can't blow them out or wear them out.

Get the new SMOOTH-ON Instruction Book (No. 16). It's yours for the asking.

The Slogan of the Cameron—"Character: The Grandest Thing"

600 Gallons a Minute Against 1250-ft. Head

The above illustration shows a No. 6 Four-stage, Class "MT" Cameron Centrifugal Pump, with a 300-horsepower motor, having a capacity of 600 G.P.M. against 1250-ft. head. This

CAMERON CENTRIFUGAL

is installed in a large western mine, where it is giving highly efficient service at a low upkeep cost.

Back of this high efficiency is simplicity and excellence of design. Back of this low upkeep cost are rigid elimination of the unfit in choosing material, and thoroughness in manufacture.

The lower illustration shows the simplicity, compactness and accessibility of these Cameron Centrifugals. In mines all over the world they have earned a reputation for giving the highest efficiency at the lowest upkeep cost.

Bulletin No. 7251 tells the story. It's free.

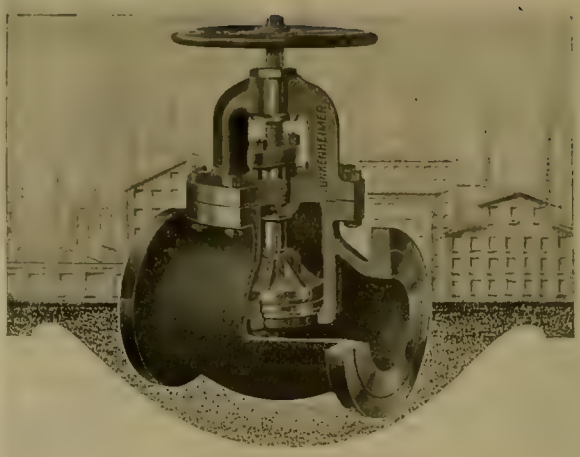
SAN FRANCISCO LOS ANGELES NEW YORK

16-T



Conserve your valve equipment!

The excessive demand for high quality valves created by the expansion of industry makes conservation of valve equipment imperative.

In Lunkenheimer Iron Body Bronze Mounted Globe, Angle and Cross Valves the regrinding seating surfaces and interchangeability of all parts renders the repair or renewal of any part an operation easily accomplished.

Users are requested to follow this principle and reap the benefit of their installation. In addition to saving time and money, it aids in CONSERVATION—a factor of vital importance to the successful and speedy termination of the war.

OUR "WAR-PERIOD" APPEAL

ENGINEERING APPLIANCES ARE PRIME WAR ESSENTIALS

Stocks of distributors and facilities of manufacturers must be adjusted to care for essential needs.

Lunkenheimer patrons are earnestly requested to assist in the common cause by confining their War Period specifications to requirements for essential plants, craft, vehicles, or equipment.

REPAIRING vs. WAITING

The Vulcan Oxy-Acetylene Welding and Cutting Outfit

Makes repairs quickly and easily—stronger than when new. Saves endless delays. "Vulcan" is most efficient welding and cutting plant. Most economical of fuel, easiest to handle. Be sure to get the "Vulcan".

Janney Flotation Machine

The Janney Mechanical Air Flotation Machines circulate a mechanically agitated pulp over an air mat through which air is continually being forced. This gives a maximum extraction and the highest grade of product. Operation entirely automatic. No froth removers or regulating gates. **Janney 24-inch machine** with individual motor drive and **Janney 12-inch machine** with belt drive will meet any condition you have. **WE SOLICIT YOUR INQUIRY**

for wet or dry screening. This is the wet screen, with distribuor.

Really Close Screening—

Such as the Impact Screen has already brought to a great many mills, will speed up your re-grinding department in a way that will surprise. In addition, the Impact Screen will materially reduce your bills for wire cloth, and handle a tonnage that is incomparable.

Really close screening is a profitable subject to look into, particularly at present. May we send you a copy of Bulletin 9-B, which covers the matter thoroughly?

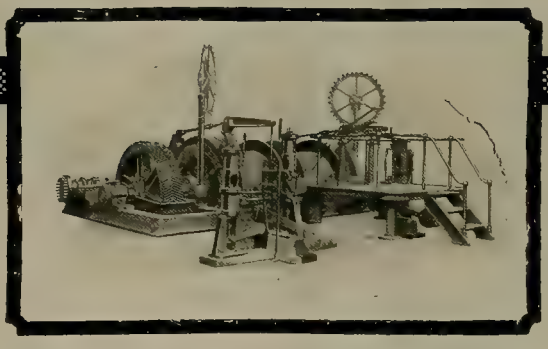
Milling Machinery and Smelting Equipment Since 1860



This standard double drum geared hoist has 60 by 42 inch drums, two 60 inch clutches, two 80 inch post brakes, all air-operated; dial indicators, herringbone gears, flexible coupling. We have built this hoist for various mining companies in the United States, Canada and Mexico.

W-S-M Electric Mine Hoists

The manufacture of hoists has been a specialty of this Company for many years. In our hoist construction there are combined with good and carefully selected materials an engineering and manufacturing excellence, developed under the guidance of high ideals, but tempered and made practical by long and diversified experience.

A W-S-M Hoist is not the lowest-priced hoist you can buy. In fact it is perhaps the highest-priced hoist built. But superior service, safety, economy of operation, reliability and long life more than offset the additional first cost.

For Dewatering Slimes and Concentrates—

When you put in an installation for dewatering slimes or concentrates, the object is to *dewater*, to get them as dry as possible. Therefore, the most logical thing to do is to install a machine which most perfectly performs this service. That machine is the ***American Continuous Suction Filter.***

It requires but little floor space and little headroom. It is extremely convenient and accessible and has over double the capacity of other vacuum filters per unit of space occupied.

¶ Our engineering staff is at your service to assist you in solving your filter problems. Ask for descriptive literature.

OVOCA CLASSIFIER

Now Accomplishes What Was Once Impossible---

SEPARATING FLOTATION CONCENTRATE

The economic handling of flotation concentrate is one of the live questions of the hour. Once the fine sulphides are oiled and floated they are invariably difficult to sink again. It has hitherto been impossible to make a clean and continuous mechanical separation of float concentrate from solution.

The Ovoca Classifier, however, gives a unique separation; and as used in flotation plants, effectively breaks up the "float," giving in one operation a continuous weir overflow of clear solution for return to the process, and a continuous discharge of concentrate carrying about 30% moisture, even when 60% of the concentrate will pass 200-mesh.

With this Classifier it is only necessary to pipe the "float" to the machine and convey from the Classifier the clear solution and the separated concentrate, the latter usually by belt conveyor, the operation being completely automatic.

NOTES 37

WHY WORRY OVER BUCHANAN NOW? 39
Opposition by some Senators to according a site in Washington for the statue to James Buchanan; unfortunate to revive sectional animosities at this time; estimate of Buchanan's character; errors of other Presidents; weak men do not become presidents of the United States; a presidential duty to pursue his own policies. M. & S. P., July 13, 1918.

LABOR AND THE WAR 39
Addresses by Sidney J. Jennings and E. B. Howell; changed attitude of corporations toward labor; better understanding of the relations between labor and capital; loyalty of American labor; example of the supreme devotion to country shown by the workingmen of Belgium. M. & S. P., July 13, 1918.

THE MEXICAN EDITORS 40
Critical diplomatic relations with Mexico; visit of Mexican editors to the United States; their abuse of a courtesy extended by the President; opportunities afforded them to see our preparations for war; it will show them we are invincible, and may improve the relations with Mexico; possibilities of cementing good-will through financial arrangements. M. & S. P., July 13, 1918.

DISCUSSION

DOCTOR DOUGLAS
By Courtenay De Kalb 41
James Douglases of today and yesterday; a famous name given fresh renown by the dean of American mining engineers; the significance of his life. M. & S. P., July 13, 1918.

CONSERVATION OF TECHNICAL ENGINEERS

RIFFLING

Increasing the Capacity of the Table You've known so well for 20 Years

There have been great changes in mining and mill equipment since the first Wilfley got on the job, 20 years ago. The Wilfley has stood the test of time—because the Wilfley principles were right.

At the same time, there have been Wilfley improvements—many of them—but the Wilfley principle—concentration on a diagonal line—has survived.

The new riffling systems developed by our engineers are based on years of experience with the Wilfley Table, and mark an important advance in the concentration of ores, both in greatly increased **capacity** and in **extraction.** The No. 10 and No. 1623 Wilfley riffling systems give large capacity on complex ores with clean separation. There is a Wilfley riffle to meet practically every condition in the concentration of ores.

No. 6 Wilfley Table

In one case a set of our new riffles on an old Wilfley **increased the capacity five times,** with increased **metallurgical efficiency.**

It is important to get the right riffles to meet your conditions. Our engineers will gladly cooperate with you.

Learn why the Calumet & Hecla Mining Co., Anaconda Copper Co., and other plants each have more than 500 Wilfleys.

"WHAT we seek is the reign of law, based upon the consent of the governed and sustained by the organized opinion of mankind."

SULPHURIC ACID manufacturers are now restricted by the Price Fixing Committee of the War Industries Board to $28 per ton for the 66° product, and to $18 for the grade registering 60° Baumé. These prices will rule until September 30.

GREAT BRITAIN has undertaken to prohibit the circulation of metallic currency at a premium. An Order-in-Council makes it a criminal offense to sell or purchase any coin current in the United Kingdom for an amount exceeding the face value of the coin. The restriction applies also to the offering or accepting of coin in payment of any obligation at a higher rate than its minted denomination. This is a wise provision, although it establishes officially the depreciation of the purchasing power of gold that the acceptance of specie at a premium would tend to alter.

LABOR is not a commodity, so declared the American Federation at its recent meeting in St. Paul. This raises an interesting question, the answer to which will be expressed in the relation of the worker to industry after the War. Under the old system, which still prevails, the value of labor is appraised and is paid for in terms of the monetary standard. It thus falls into the category of merchandise. If it is not that, then it must be classed with capital and should accept the risks of reward incident thereto. Organized labor has persistently declined to do that. Profit-sharing is quite a different thing; it still shields the workman from the financial dangers that beset the capitalist. In the declaration made by the A. F. L. we perceive the familiar argument of the socialist. It is evident, however, that the laboring classes, as represented by their leaders, are close students of political economy. Whether they advocate fallacies or not, they thoroughly understand the principles upon which our present economic system is founded. It is safe to say that, as a class, they understand these matters better than the large majority of manufacturers and business men. If we are to deal intelligently with the great social questions that confront us it will not suffice to acquire haphazard ideas concerning them from the experiences of our daily life. Exact knowledge of the fundamentals must be obtained by systematic study. The mining engineer must add economics to the long list of sciences he is required to master.

TIN is one of the few metals in which the United States is deficient, despite the efforts made to develop such deposits as exist in several of our mining regions, notably Alaska, California, Dakota, and the Carolinas. It is interesting therefore to record the fact that the War Department, on the initiative of the War Industries Board, has commandeered the Cash tin mine in Virginia. The prospect in question is on Irish creek, in Rockbridge county, Virginia; it has been tied by litigation for many years, although well reported by successive engineers. The War Department will execute a lease to responsible parties on condition that they proceed to work in a systematic manner, and to ensure this the Department will nominate an engineer to supervise the operations. At the same time the English owners of the Temescal tin mine in southern California have made it possible for a group of capable American engineers and capitalists to begin production from that long neglected but apparently meritorious property.

FINANCE is rarely inspiring, but the generous form of reciprocity lately introduced into the relations between this country and the republics of South America is beginning to effect a conquest of mutual goodwill rather than of commercial advantage that awakens sentiments of kindly neighborliness. We have referred on several occasions to the device by which trade-balances in favor of the Argentine and Peru are allowed to constitute a gold-credit for their account in the United States Federal Reserve Bank, against which the governments of those countries issue currency, yielding them the profits that always accrue from the emission of paper against a metallic reserve. Both we and they benefit by the arrangement, and the exchange of commodities is encouraged and facilitated. So successful has the scheme proved that Chile now has joined the list, and similar arrangements are being made with other Latin-American states. It has been suggested that the gold-credit, amounting to nearly $2,000,000 per month, that is growing in England for the account of China in payment for the 150,000 coolies now serving as a labor-

army in France, might be employed in the same manner. The idea carries with it a closer drawing together of the nations in the compact, under conditions of mutual trust and responsibility. A sentiment of fellowship, which facilitates international co-operation, develops from this to a degree that trade alone never has been able to accomplish. The Administration is to be congratulated on the evolution of this wise plan of reciprocity.

IT is surprising that people so clever as the Japanese should send representatives to this country that cannot speak English. For example, Prince Yoshihisa Tokugawa is paying us a friendly visit as a representative of the Japanese Red Cross; he was a guest of the Commonwealth Club in San Francisco and delivered a speech in Japanese, which was translated by a Japanese interpreter whose rendering of it in near-English was only a little more intelligible than the original utterance. Of course, it is an American custom to send gentlemen quite unable to speak any language but their own to represent the United States in foreign countries and the absurdity of the practice is not fully appreciated; we can claim no superiority over the people of Japan in this respect, and yet we venture to express surprise that they should imitate our blunders. Again, our readers are aware that a large number of technical men come from Japan to visit our mines and smelters; we ourselves have had the pleasure of meeting many of them; and in doing so we have marveled why they did not learn English before beginning their journeys of observation, for our own experience has taught us that all the resources of the language are needed in order to obtain accurate and detailed information on technical matters. How can a Japanese possessing hardly enough command of English to order a breakfast expect to extract trustworthy information on mining or metallurgy in the course of his visits to our mineral regions. We hazard the guess that some of the note-books carried back to Japan contain a great deal of inchoate matter. Perhaps one of our many friends in Japan will explain the anomaly. We refer to it only in order to promote a mutually good understanding.

COPPER is now quoted officially at 26 cents per pound. On July 2 the War Industries Board raised the price 2½ cents from the 23.50 cents that has prevailed since September last. This fixation of price, subject to revision on August 15 next, was made by agreement between the price-fixing committee of the Board and the principal producers of the metal. In taking this action, the Board stipulated that the producers will not reduce the wages now being paid; that they will sell to the Government, to the public, and to the Allied governments at a price not above this maximum of 26 cents; that they will take the necessary steps, under the direction of the Board, for the distribution of the copper, so as to prevent it from falling into the hands of speculators; and that they will pledge themselves to exert every effort to maintain production. It is worthy of note that the Federal Trade Commission has reported that 21 copper-mining companies in 1917 made profits ranging from 1 to 107% on their investments, the average profit being 24.4%. Probably over 70% of the production, it is said, was obtained at a price yielding 20% on the investment. In 1913 these same companies earned an average profit of 13%, the range in that normal year being between 1 and 56% on the investment. The significance of these statements hinges entirely on the definition of 'investment,' as to which the copper-producers and the Commission are likely to disagree. The 'profit' does not include Federal income or excess-profit taxes. The question now arises as to whether the labor-unions will demand an increase of wages on the basis of the former agreement whereby their pay was fixed by a sliding scale in which the price of copper was the determining factor. It is likely that the mining companies can show that the advance of 2½ cents is absorbed by increased taxation, higher railroad freight-rates, and by the advance in the cost of supplies. The publication of trustworthy data on these matters would be wise.

LAST January we criticized the delay of the Government in adopting a practical policy for supplying the fixed nitrogen that we need; we also censured the officials that permitted the advice given by friends of Germany to defeat the purpose of the Act passed by Congress in the summer of 1916 appropriating $20,000,000 for a suitable plant. These Teutonic obstructionists managed to befuddle our officials so far that they took no action to break ground for the construction of a plant until last November. Then the country was told that a great factory would be ready at Muscle Shoals, Alabama, by July of this year. We do not care to pose as prophets of evil, yet neither are we willing to encourage faith in the impossible, so we denied that the thing could be done. To promise miracles is a poor shield for past errors in judgment, as is now proved by the announcement that the contractors hope to have the first unit complete this autumn, and that it appears doubtful whether the full plant will be ready in less than two years. Meanwhile we are depending mainly upon nitrate from Chile, and the Shipping Board is rushing vessels, almost in ballast, to Chilean ports in its haste to obtain the precious salt for making munitions. At the same time the cotton crop this year is being grown largely without fertilizers, which will proportionally lessen harvest, and the Hawaiian sugar growers announce that the shortage of nitrate is so serious that the crop this year will be reduced by half. It is well enough to proclaim the great things that our country is accomplishing, but we must not forget that in a thousand subtle ways, even through men that preach patriotism and make ostentatious sacrifices in public, does Germany work in our midst to slacken our speed, to reduce our harvest, and to oppose our use of improved methods by advocating more tests where we already know enough to ensure good results. The bungling in this nitrate business is one of the most preposterous scandals that has come to light. Its effects are just beginning to be felt. The Government has taken what nitric acid it needed for making powder, because we

could not maintain a scorching battle-front without it, but to this end we have had to rob the soil of fertilizer, involving lessened crops, higher prices, and financial hardship for all the people. The men who counselled the Government to waste time in 'prudent' experimenting upon the methods for fixing nitrogen, which Germany already was using to supply her wants, committed a crime against the American people; they should all be set aside for the duration of the War, so that they may do us no further harm.

Why Worry Over Buchanan Now?

At a time of national stress, when the united enthusiasm of all Americans is essential for our country's good, the spectacle of the Senate occupying the best part of a day in raking up the buried animosities of the Civil War is disheartening. Our 'scholar in politics,' the distinguished senator from Massachusetts, allows his political prejudice to cloud his good sense. The question at issue was the mere authorization of a site in some public place in Washington for the erection of a statue to a past-president of the United States, James Buchanan, for which a sum of money had been bequeathed in the will of his niece, Harriet Lane Johnson. The resolution had already passed the House without exciting serious comment, for manifestly a discussion at this time that revives sectional feeling could find no justification. The attempt to brand Buchanan as a traitor has utterly failed in history; we are left with the picture of an old man of irresolute character facing a crisis too great for him, and made the more timid because a few months later he must vacate his office in favor of Abraham Lincoln. Trying to please both the North and the South, he won only hatred and scorn from both. Yet, he was a great statesman; even his enemies conceded that he was incorruptible, and his whole life was spent in the devoted service of this country. Men of disloyal heart cannot so far conceal that fatal blemish as to pass the winnowing of a presidential election. The feebleness we talk of when we criticize some of our past executives is a matter of comparison among the giants, for weak men do not become presidents of the United States. It is unbecoming of Senator Lodge thus to assail one who has held the highest office in the gift of the Nation, and who was never convicted of wrong by the only competent Constitutional tribunal while he was alive. Any man who has won that great distinction is entitled to honor. It is petty to recall a lapse of good judgment in the Ostend resolution, which looked with aggressive jealousy toward Cuba, when another recent president, whom all America honors for rare achievements, sent a message of congratulation prematurely to the anticipated infant republic of Panama; also it were to look too curiously if we should venture to scrutinize the halting policies of presidents in the last days of their administration. Our Mexican policy started off on the wrong foot for that very reason, and we believe that no one now regrets it more keenly than ex-president Taft himself. We submit that a president should be a firm executive, according to the light of his understanding and belief, to the last act of his administration, regardless of his successor. It will tend to stultify our Government if it is to be crippled in decisive action from November to March every time that a new president is elected. An exhibition of that weakness has been given many times, and when the hour is not critical no one cares deeply, but in Buchanan's day they did, and there was reason for it. Nevertheless, it is a narrow view of civic responsibility that inspires an attack by a scholarly senator at this particular moment when he cannot do it without stirring sectional passions that are being finally and utterly obliterated under the welding heat of a united struggle to the death.

Labor and the War

On other pages of this issue we publish the larger part of two speeches made at a recent meeting of the Butte section of the Institute by Messrs. Sidney J. Jennings and E. B. Howell. The subject was the relation of the mining company to its employees and the improvement of that relation in the interest of industrial development. Mr. Jennings quotes the old saying about a corporation; it was Thurlow that said "it has no soul to be damned and no body to be kicked," but the law has found something to kick and the humanitarian has discovered a soul to be saved. Indeed it is remarkable today how many clever men, immersed in financial or technical operations, have suddenly awakened to an appreciation of economics on the one hand and of human welfare on the other. Some of their statements have a naiveté that disarms criticism, for the convert appeals to a generous mind. Indeed, it is most encouraging to observe how captains of industry are beginning to recognize that workmen are not cattle, because, among other things, they vote; also that companies have responsibilities to others than their shareholders, namely, to the community amid which they operate. The relationship of labor to capital is discussed nowadays in terms less abstract than of yore, we recognize that each stands for human beings, living in a democratic world, the chief ideal of which is the essentially American idea of giving to every man a chance. The War has contributed to this development. Armageddon has involved not a contest between mere professional armies, but between entire peoples; thereby emphasizing the importance of the stand taken by labor, both as an organized party and as a mass of individuals. The workman, or manual laborer, has behaved well, rallying patriotically to the call of his country, in England, in France, and in the United States. Mr. Samuel Gompers deserves the esteem he has won by his cordial support of the President, and the American Federation of Labor deserves the thanks of the country for its willingness to subordinate its smaller aims to the larger necessities of the hour. This has led to a not unpardonable exaggeration of the part played by labor, culminating in the pronunciamiento of the British

Labor party and the general recognition of the fact that industrial conditions 'après la guerre' are likely to be modified profoundly by the larger influence of labor parties, at home and abroad, in shaping policies of reconstruction when peace supervenes. Many of the inferences now commonly made on this subject are reasonable enough, but we are inclined to subject them to some discount because it seems to us that not to the laborer as such but to the fighting soldier returning from the battlefield we must look for the larger influence in the days to come. Despite all the talk of the sacrifices made by those that stay at home, it is to the man at the front that we shall owe our escape from German domination and from all the repugnant things that accompany such domination. Labor has profited too much by the War to be in a position to demand an excess of sentimental gratitude; it has been rewarded already for its willingness to work in the national cause. Miners that are receiving $5.50 per shift and iron-workers that receive anywhere from $7 to $10 per day make no great claim for sympathy as compared to those that have lost an arm or a leg in battle, or those that have lost their business or professional position by their willingness to shoulder a gun. American workmen that threaten to strike when they are receiving $5 or $7 per day may be reminded of the stand taken by the workmen of Belgium in their courageous opposition to the German invader. Of the 1,000,000 workmen in that sorely tried country, fully 750,000 have refused persistently to work for the Enemy, even after an effort has been made to terrorize them by deporting 150,000 of them to Germany and returning them in a broken-down or dying condition to Belgium in order to warn the remainder. No wonder the late Von Bissing confessed that the Belgians presented "a psychological problem." The German system of bullying and frightfulness failed to shake the steadfast resolve of the Belgian not to work for his enemy, not to make concrete, sand-bags, munitions, implements, or anything else that would aid the German effort to crush Belgium, France, and as much more of civilization as the Hun could bestride. The Belgian workman has fought as effectively as the Belgian soldier; he has disdained high wages, safety, and food in his determination not to become the tool of the tyrant. No; in the end we civilians, the mass of non-combatants constituting the community protected by the armies now engaged amid the smoke of battle, will feel indebted most of all to those that risked their lives for us, and while we shall recognize the good sense shown by those that did their duty at home, we shall be disinclined to accord to the enriched laborer any excess of adulation for his willingness to behave while receiving high pay. On the other hand, the returning soldier will impose some of his ideas upon us; he will have lived under the democratic conditions of an equal risking of life for a great cause; he will have learned to respect only those that can make good; he will have scant respect for privilege as such; even amid the horrors of war he will have become steeped in the true spirit of humanity—to live and let live. To him the laborer may look for sympathetic understanding, and to him the man of skill and of brains may appeal with confidence. Conditions 'after the War' will be in the hands of the best of this generation, in those of the courageous, vigorous, and clear-sighted young men that performed their supreme duty cheerfully, instantly, and successfully. We do not fear a future that is to be molded by them.

The Mexican Editors

Relations with Mexico are becoming more acute each day. Diplomatic notes just published show that our Government has made a peremptory demand upon Carranza that his confiscatory tax on oil properties shall not apply to the holdings of American citizens. At the same time we must direct attention to an insult offered to this country by the visiting Mexican editors, despite the courtesy that President Wilson showed them in an effort to display our goodwill toward their country. His address to them set forth disinterested motives and positive friendship toward Mexico, such as all intelligent Americans will endorse; and he accorded them the privilege of printing his remarks in their own papers before releasing them to the American press. The result was a garbled publication that put the President, and the nation for whom he spoke, in a false light before the Mexican people. Since then these Mexican visitors have been entertained in the principal cities of the country; they have been shown munition-shops, shipyards, and other industrial plants, from which even the average American is barred. We must remember that these are trained observers, that they are men of understanding, and that they edit papers controlled by a dictator masquerading as a representative ruler, a man whose hostility to us has been unwavering, and whose friendship for Germany has been a growing menace to our welfare. The construction to be put upon the attitude of our Government in showing them our factories is that they will carry back to Carranza the proofs of our invincibility, and demonstrate to him that his own best interest will be served by getting off the fence on the American side. He has been so eager to stand with the winner that his favors swung for a time like a pendulum between the United States and Germany; finally he was influenced by the insistent Teutonic propaganda, conducted in a manner beneath the dignity of a self-respecting nation, to credit the testimony dinned into his ears that the success of the German arms was assured. Men like Señor Luis Olivera, the accomplished editor of 'El Universal,' whose speech at the luncheon tendered to the party in San Francisco displayed so clear an understanding of our resources and military readiness, will take home to Carranza a different impression. The visiting editors must now realize how remote from our thoughts is the idea of aggression, and how fully the American people endorse the pledge given by President Wilson to protect the autonomy of every Latin-American country. We would not be surprised after this to see financial arrangements, similar to those that have stimulated so kindly a feeling between the United States and the Argentine, become the basis of a rapprochement with Mexico.

Doctor Douglas

The Editor:

Sir—It is by way of being formal that we speak of him as James Douglas. As a matter of fact America is full of James Douglases; so is Scotland; and they stretch in a long line of rugged, intellectual, capable men back to that remote Sir James of Castle Dangerous, who knew, in his medieval way, how to make his name respected, and to blaze the trail for Scottish progress; but there is only one 'Doctor' Douglas, and that is the honored dean of American mining engineers, who has left us in the flesh but will remain with us in the spirit always. This is no mere figure of speech. He did more than open great mines, yet great mines in themselves constitute one of the most important sources of national strength; their development means the creation of centres of re-vitalization for society; and the men who develop them have helped to direct human progress and to determine human destiny in a very large sense. Though Themistocles, for example, did many things as politician and statesman, for which he is chiefly celebrated, his most significant achievement was in turning the mines of Laurium into a reservoir of national strength. He caused the intensive unfolding of their treasure, and thereby made it possible for Greece to live and to sustain the growth of culture and finer manhood, because he persuaded his fellow Athenians to permit the use of the silver from Laurium to build a fleet. So it happened that the fleet built from these revenues saved not only Greece, but all Europe, from being engulfed in the savage romanticisms of a Persian 'kultur.' Can anyone disentangle the name of Themistocles from the mines of Laurium or from the web of Grecian history in which he was a vital thread? The life of Doctor Douglas also is a vital thread in the strong fabric of American development. That is not to say that he was an essential thread in it, for he would have been the first to confront me with the philosophic truth that no man is essential. The world will career along its way whether one or another live or die; but in retrospect there are those who are forgotten and those whose lives were so vital that things would have been altogether different had they not lived and labored and filled the age in which they worked with something better than material achievement. It is a distinguishing characteristic of this great miner that he vitalized a necessary profession with a new understanding of its spiritual obligations. He lifted it above the mercenary; he remembered man as an instrument in the making of the industrial strength of the nation. Far beyond Bisbee and Arizona, and the South-West, his spirit illuminated the lives and directed the thoughts and activities of men over whom he exerted the influence of a guiding mentality so high that it made him the intellectual father of many. It was because he dared to open his mines and smelters and workshops to all who came in the spirit of learners that mines and mills and smelters throughout America have accepted the democratic doctrine of generous educational exchange. It was because his sympathy reached down to the miner, and to the miner's wife and babies, that the broad principle of accruing annuities for old age, and protection to the family after death, became a humanitarian example of justice to the workingman so widely followed. It was he who showed the way, not to a crude profit-sharing, but to actual participation in the ownership, by offering to every employee the chance to accumulate stock in the great Phelps-Dodge chain of industries, held in the treasury available for them to acquire at par by small payments out of wages, although the premium on these shares was so great as to multiply the investment many-fold as soon as any workman completed the easy purchase and had the transfer made on the company's books. His spirit was of the sort that ennobled those with whom he dealt, and this quality was impressed upon his welfare-work; it was always cultural, expansive; it never was offered as a largess, it never made a man feel dependent; on the contrary, it placed the beneficiary on the footing of self-respecting manhood, making it self-evident that he was the beneficiary not of an institution but of his individual effort. This method of dealing with men as men instead of as servants he impressed upon the corporation whose policies, consciously or unconsciously, he molded into a reflection of himself, for he was associated with a group of kindred natures, who found in him a nobility of character that was irresistible in its power of leadership. He was fortunate in these rare associations; it gave him freer scope; the seed had fallen in good ground and the plant was not withered before the harvest.

It was not merely as a practical man, as a competent man, that he made his deep impress upon the work of his generation; it was chiefly in his example as a broad-minded spiritual leader of the men in the profession of mining and metallurgy at a critical period in our national development, that he justifies the parallel with the renowned Greek. It must be observed that his span of activity covered the growth of mining in the West from the time when it was a scramble for spectacular riches to its maturity as a vast industry founded on true conservational principles, and he was a directing force, by ex-

ample and by doctrine, in promoting this evolution. The young engineers recognized in him the quality of a kind wise father to them all, one who remembered his own early struggles, who appreciated their difficulties and understood their aspirations. A multitude of American engineers will claim the privilege of naming him, above all other men, their professional father. Even those who did not know him personally, but had merely read his unpretentious words of scientific instruction and human counsel, felt his power, and recognized his fatherhood in their thought and in the practical administration of their duties. When a man becomes a master, first over himself and over the work allotted him to do in life, and then comes to make himself felt as a guide to successful endeavors by others, because in him is found wisdom, competency, truth, justice, and love, and when this influence extends over a continent in its moment of change from an untamed desert to a bulwark of national strength at a great crisis in the history of civilization, there is no exaggeration in naming him as a factor in our preparedness without whom we would not have been so well able to gird on our armor in time. Moreover, he knew what he was doing without boasting of it; he never espoused the weak and puling tenets of the pacifists; he was kind, he was loving, he was humble; but he was also a militant nature, a man's man, disdaining maudlin sentiment.

The records of his special service to his profession, to Canada the land of his birth, and to America the land of his adoption, are written elsewhere; they justify this appreciation, which is a tribute that will, I know, awaken hearty response in thousands of hearts. Some of these will testify to his unique qualities as shown in mining; others will think of him as a help to them and to the world in the progress of metallurgy; others will reflect upon his distinction as a builder and manager of railroads that set new ideals of justice and honor in their administration; others, who knew nothing of all these things, will hold happy recollections of the long series of choice contributions to the literature of the day that found their way from his pen into the magazines, and they will express the joy they experienced in reading the plain truths of Canadian and New England colonial history interpreted sympathetically by this keenly analytic mind. Again, there are the students who have gone forth from Columbia University, to whom he was 'our Doctor Douglas,' carrying his inspiration in their hearts, scarce knowing that to another body of young men, those of his own Alma Mater, Queen's University in Canada, he also stood as a commanding Chancellor, their idol, their spiritual and intellectual mentor. A man who has touched the hearts of youth with the flame that kindles to high endeavor, who has created ideals for a great fraternity upon whose skill and industry the nation depends so largely for defence in war and for progress in times of peace, is one whose name will live and be known with increasing honor as time clarifies in sharper outline the greatness of his work.

COURTENAY DE KALB.

Stanford University, California, June 30.

Conservation of Technical Engineers

The Editor:

Sir—In the issue of your journal for June 15 I have read with interest your editorial entitled 'Conservation of Technical Engineers,' and as a true American citizen I agree with your sentiments heartily. In another journal I have noted that the U. S. government asks for 2000 experienced engineers between the ages of 32 and 42 to make application to attend the Engineers Training Camp. If the applicant is lucky after attending this camp he may be given the rank of lieutenant or captain. This seems to be rather unfair in view of the fact that all doctors, without any of this preliminary training in camp, on entering the service, be they good or bad, are given the rank of captain. Knowing you to be an engineer whose heart has remained with the members of the profession I beg to mention this apparent discrimination so that it may be corrected before all active practical engineers have become promoters or store-clerks.

A MINING ENGINEEER.

Los Angeles, June 19.

[It is pleasing to note that our correspondent, in common with many others, so fully realizes the error that was committed in allowing our young technical men, under the impulse of splendid patriotism, to rush into branches of the military service where their technical knowledge was largely if not wholly unused. This is very much like mining an argentiferous silver ore having a barite gangue, sorting out the rich galena with its precious accompaniment to be thrown over the dump, while shipping the barite to the paint-manufacturer. Estimates of the number of young men in training for technical work and of recent graduates that on the threshold of their career have joined the colors show that the country is short approximately seven annual crops of scientifically educated recruits to its industrial enterprises. These are the men on whom we depend to insure efficient intelligent supervision of the complicated operations that are devoted to supplying our fighting men at the front. Perhaps the doctors fare better than the engineers; but we would complain less of discrimination as regards the rank given those actually enlisted in the engineering corps, where their special talents are utilized, than we do of the wastage of trained men in a kind of service that does not call for the knowledge of chemistry, metallurgy, or electricity.—EDITOR.]

COPPER production for 1918 is estimated to exceed the output of last year, when it was 2,400,000,000 lb., being a high record in that industry. It is stated that 95% of the entire consumption of copper is directly or indirectly by the Government.

MINERAL PRODUCTION of Korea in 1917 was valued at Y24,081,127 (1 yen = 50 cents), a decrease of Y30,000. The Oriental Consolidated, Seoul Mining, Chicksan, and Chosen companies contributed the most of this, in gold, copper, and tungsten.

Apexes and Anticlines

By ROBERT M. SEARLS

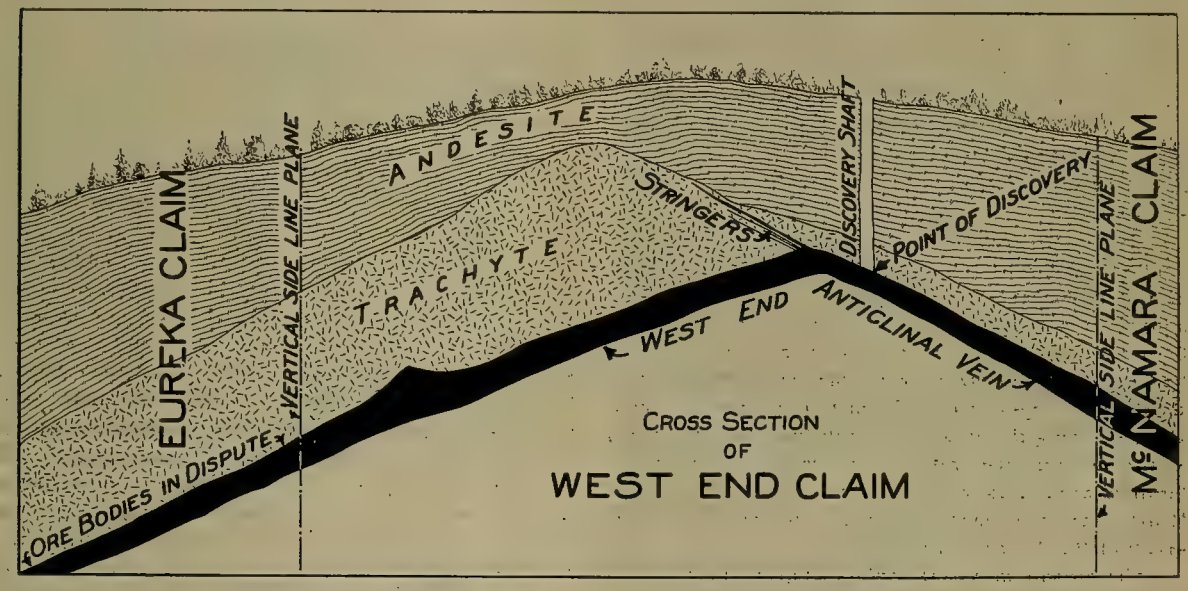
The Supreme Court of the United States has been heard from again on the extra-lateral question, and a new field of combat over apex problems has been opened up. The case at bar was the old controversy between the Jim Butler Tonopah Mining Co. and the West End Consolidated Mining Co. The essential questions involved were:

First: Can the crest or crown of a vein that is found in the form of a single anticline, dipping in both directions, and having no defined terminal edge, be considered as an apex upon which extra-lateral rights can be predicated?

Second: Having such a vein, can the locator of a claim, in which the crest of this anticlinal roll is found, follow both limbs of the vein extra-laterally through opposite side-lines?

A careful reading of the opinion indicates that the Court has evaded a decision on the first question by refusing to go back of the trial-court's finding that an apex as a matter of fact existed, and that it has decided the second question in the affirmative. The opinion will be better understood if the facts are outlined. The following sketch, adapted from defendant's exhibit G, modified in accordance with the Court's findings, is illustrative of the situation.

The West End company owned the West End claim in the Tonopah district, Nevada. The Jim Butler owned the Eureka and Curtis claims adjoining the southerly West End side-line. All the claims overlie what was known in the early days of Tonopah as the 'big flat vein,' which is the subject-matter in dispute. This vein has the crest of its anticlinal fold in the West End claim, cutting the easterly end-line and the northerly side-line. From this crest the vein dips in both northerly and southerly directions at an angle varying from 17° to 30° in different parts of the claim, and crosses the opposite side-lines on the dip. The crest of the fold is covered to a depth of several hundred feet by volcanic flows of 'Midway andesite' and 'Fraction dacite-breccia.' Discovery was made on the West End claim through a shaft driven through this cap to a point on the northerly dipping limb of the vein. The orebodies in dispute were in the southerly dipping limb of the vein, just beyond the southerly side-line of the West End, and vertically beneath the Jim Butler claims. In the trial court the main dispute was whether the West End vein was originally one vein, or two veins, one cut off by the other and practically joined at their upper terminal edges. The trial court found that but one vein existed; it called the crest of its anticline a "junction or union" between its "two limbs or sides"; it defined this crest or axis as an apex; and, as has been said, awarded the West End company an extra-lateral right in both directions.



As to the existence of an apex, the Supreme Court, after quoting at length the finding of the trial court, summarizes it as follows:

"Giving due effect to the finding, it is manifest that the vein in controversy is not a flat or horizontal vein or one which would be practically horizontal but for a succession of rolls or waves in its elevation. On the con-

trary, it is shown to be a fissure vein with two dipping limbs whose course downward is substantial, regular, and practically free from undulations. For 750 ft. out of its total length of 1150 ft. within the West End claim each limb is practically a separate vein with a distinct summit or terminal edge. For the remaining 400 ft. the two limbs are united and from the point of union the mineralized quartz or rock continues upward for from 20 or 30 to more than 100 ft., and this seems to answer all the calls of a summit or terminal edge. In these circumstances we hardly would be warranted in saying as matter of law that the vein has no top or apex within the claim in the sense of the statute. See Stewart Mining Co. v. Ontario Mining Co., 237 U. S. 350."

An examination of the record leads one to wonder how the above conclusion was reached. The evidence was not in dispute as to the existence of vein-matter throughout a large portion of the exposure between well-defined walls of andesite and trachyte or rhyolite and trachyte. The whole vein-formation is unquestionably anticlinal in its general characteristics. True, the hanging wall at the crest of the fold was traversed by stringers of vein-matter continuing upward for a distance, forming what was termed at the trial a "halo," as observed by the Court in its finding. But this condition also prevailed to some extent on the dip of the vein, and was due in all probability to replacement along subordinate fissures extending into the hanging wall. The existence, at the crest of the fold, of the stringers that were minor features when compared with the great width of the main vein, in view of the obvious roll in the formation as a whole, hardly warrants the view that these constitute a true apex, especially since practically all these stringers along the crest of the roll dipped to the north and away from the orebodies in dispute. Certainly a terminal edge to the vein is lacking. That the Supreme Court was in some doubt is indicated by the closing paragraph of the decision where it said:

"The contention is not that the top or apex of this vein has been found elsewhere, but only that what is found in the West End claim is not such in the sense of the statute. 'The law,' as has been truly said, 'assumes that the lode has a top, or apex, and provides for the acquisition of title by location upon this apex.' Probably this assumption could not be indulged where the fact appeared to be otherwise, but it serves to show that the absence of a top or apex ought not to be adjudged in the presence of such a finding as we have here."

The second conclusion of the Court, that, granted an apex exists, the vein may be followed extra-laterally in opposite directions, is perhaps open to little criticism. The Act of 1872, Rev. Stat. 2322, gave to the locator the right to follow "all veins, lodes, and ledges throughout their entire depth, the top or apex of which lies inside of such surface lines extended downward vertically, although such veins, lodes, or ledges may so far depart from a perpendicular in their course downward as to extend outside the vertical side-lines of such surface locations."

In many decisions this provision of the law has been held to grant to the locator all the veins whose apexes are within his location. While it may be that no specific case has been passed upon where secondary veins dipped in opposite directions from the discovery vein, there is certainly no exception in the above quoted section of the Act to justify an inference that the extra-lateral right on either vein would be denied the locator if they did dip in opposite directions. If then the right exists where two veins with separate apexes dip at a diverging angle, why should it not exist where a single apex is found and the vein splits into two diverging limbs that cross opposing side-lines? The Supreme Court followed the line of reasoning just stated, and it seems cogent. If the apex be assumed, then the extra-lateral right follows under the law, within parallel end-lines, no matter in which direction the particular veins may dip.

The decision as a whole serves to emphasize the common sense of the juries of citizens that sat in the Leadville cases in Colorado and refused to find that such a thing as an apex could exist under conditions not greatly dissimilar to those in the Jim Butler case. If an apex be conceded, and the end-lines are parallel, then the extra-lateral right follows even if it bars mining by all the other claim-owners in the district. But the burden of proof is on the extra-lateral claimant to prove his apex. Where a blanket vein, or one dipping at a flat angle, extends for a considerable distance beneath a given district, justice to a multitude of neighboring locators and the public interest, in freedom of opportunity to all, seems to require that such a claimant should be held strictly to sustain fully that burden before his extra-lateral claims receive judicial confirmation. He should be required to show something more than the summit of an anticlinal roll with a few stringers projected into the adjacent country-rock. He should be asked to show beyond doubt that there is but one crest, and that he is not basing his claim upon the discovery of one of a series of elevations or folds in the vein-sheet, none of which may properly be classed as apexes. A terminal edge should be shown in conformity with the rule in the Leadville cases.

The Supreme Court based its decision ultimately upon the particular finding of fact of the trial court that an apex existed under the peculiar geologic conditions there exposed, but announced no general principle or rule by which we may be guided in the future. Whether the crest or axis of an anticlinal vein without stringers projecting upward from this crest or axis is an apex is not determined.

The Court has indicated in the Jim Butler case that it will not upset the trial court's findings of fact on the question of apex existence. Surely this attitude throws upon our trial courts the duty of scrutinizing the evidence in such cases with great care, in order that the apex law, which has been shown to be founded upon sound principles of equity when applied to deep-lode mining, shall not, in cases where the vein approaches the horizontal, work an immeasurable advantage to one locator at the expense of an irreparable injury to all his neighbors.

Gold and Silver Mines of the United States

During 1916, the last year for which data are available, there were 1530 placer and 3765 deep gold and silver mines in this country. Alaska led with placer properties, having 650, and only 47 deep mines, while Colorado had the most deep mines—825—but only 27 placer properties, according to the U. S. Geological Survey.

The principal gold-producing States were California, Colorado, Alaska, Nevada, and South Dakota, contributing 80% of the total in 1916. The principal silver-producing States were Montana, Nevada, Utah, Idaho, Colorado, and Arizona, accounting for 90% of the total.

The mines, in order of output, stood as under:

GOLD

Operator	State	Mining district	Source of gold
Homestake	South Dakota	Whitewood	Dry or silicious ores
Yuba Con.	California	Marysville	Dredging gravel
Goldfield Con.	Nevada	Goldfield	Dry or silicious ores
Empire Mines	California	Grass Valley	do
Alaska Gastineau	Alaska	Juneau	do
Cresson Con.	Colorado	Cripple Creek	do
Portland	do	do	do
Vindicator Con.	do	do	do
Alaska Treadwell	Alaska	Juneau	do
North Star Mines	California	Grass Valley	do
Yukon Gold	Alaska	Iditarod and Ruby	Dredging gravel
Alaska United	do	Juneau	do
Utah Copper	Utah	West Mountain	Copper ores
Kennedy Mining	California	Jackson	Dry or silicious ores
Liberty Bell	Colorado	Upper San Miguel	do
Tomboy	do	do	do
Nevada Con.	Nevada	Robinson (Ely)	Copper ores
Anaconda Copper	Montana	Summit Valley (Butte)	do

[Since the above table was prepared, there have been many changes. Alaska Treadwell is closed, Goldfield Consolidated has fallen off considerably, while the United Eastern in Arizona should take about third place.—EDITOR.]

SILVER

Operator	State	Mining district	Source of silver
Anaconda Copper	Montana	Summit Valley (Butte)	Copper ores
Hercules Mining	Idaho	Leland	Lead ores
Tonopah-Belmont	Nevada	Tonopah	Dry or silicious ores
Butte & Superior	Montana	Summit Valley (Butte)	Zinc-lead ores
Tonopah Extension	Nevada	Tonopah	Dry or silicious ores
Chief Consolidated	Utah	Tintic	Lead ores

Presidio Mining	Texas	Shafter	Silicious (silver) ores

ALUNDUM manufacture and use was described by M. A. Williamson in a recent issue of the 'Metal Industry', as follows: Bauxite is calcined in a rotary calciner at 1300°C. and this product is shoveled into the arc between two suspended electrodes in an electric furnace. The furnace consists of a circular steel shell set on a refractory base. A temperature of 2050° is required to melt the bauxite. When the shell is full of molten bauxite the current is stopped and the furnace cooled. The shell is removed and the resulting 'pig' is broken into pieces. These are crushed to any degree of fineness desired, depending on the grade and the use to which the alundum is to be put. It is greatly superior to any of the natural abrasives for grinding and polishing.

The Graphite Market

Crystalline graphite production of the United States in 1917, including stocks at the mines, was 14,000,000 lb., an increase of 3,100,000 lb., according to the U. S. Geological Survey. Figures furnished by the producers of crystalline graphite show that out of total sales of 10,584,080 lb., 6.816,913 lb., valued at $982,336, or about 64% by weight and 90% by value of the total, was flake graphite containing from 80 to 90% of graphitic carbon, in large part suitable for making crucibles. The remainder, 3,767,177 lb., valued at $109,962, was dust or low-grade flake, probably averaging under 50% of carbon. The proportion of flake graphite produced is greater than in previous years, the increase having been due in part to improved methods of milling, whereby a larger proportion was saved as flake, and in part to the fact that, owing to the freight embargo during the latter part of the year, Alabama producers were able to ship only material of high grade. There were 25 mines reporting sales of crystalline graphite in 1917 against 16 in 1916. Alabama was the largest producer in 1917, the amount marketed being 6,223,095 lb., valued at $719,575; New York came next, with 2,941,040 lb., valued at $261,548; and Pennsylvania third, with 804,945 lb., valued at $77,475. California, Montana, and Texas made a combined production of 545,000 lb., valued at $33,700.

Amorphous graphite was produced in 1917 by 5 mines in Colorado, Michigan, Nevada, and Rhode Island. The output was 8301 tons, valued at $73,481, compared with 2622 tons, valued at $20,723 in 1916.

Artificial graphite is manufactured chiefly by the International Acheson Graphite Co., which utilizes electric power generated at Niagara Falls.

Imports of graphite in 1917 amounted to 42,609 short tons, valued at $8,961,988. Imports in 1913, the year before the war began, were 28,885 short tons, valued at $2,109,791. Exports in 1917, principally to Great Britain, France, Canada, and Italy, amounted to 2576 short tons, compared with 798 tons in 1916. Manufactured graphite articles to the value of $891,633 were exported in 1917, against $1,339,259 for such articles exported in 1916.

At present war prices, miners in this country who are working disseminated flake deposits must depend on their No. 1 and 2 flake for their profit. Graphite dust is merely a by-product and is salable only at a low price. Improved methods of graphite milling, adopted during the last year, promise to increase largely the production of flake of better grade.

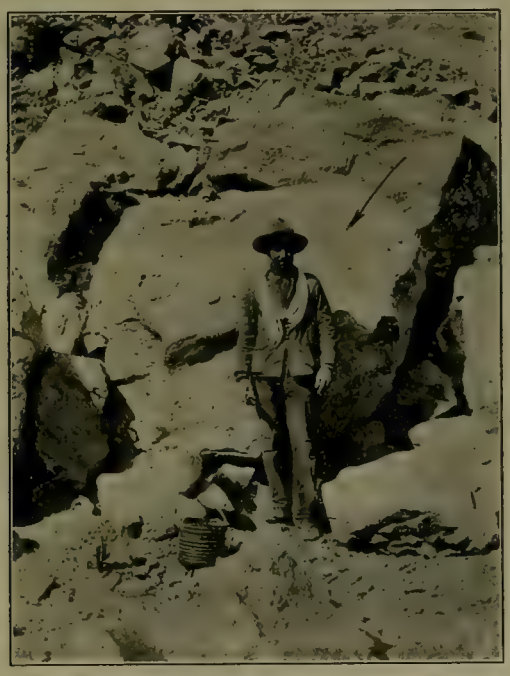
The requirements for 1918 will be between 28,000 and 32,000 tons, which may probably be supplied by domestic, artificial, and Mexican production.

Blasting Methods at Ajo

By S. U. CHAMPE

In the work of excavating the ore in the Copper mountain deposit at Ajo, Arizona, belonging to the New Cornelia Copper Co., two methods of preparing the ground to receive the charges for blasting are employed. One method is to tunnel into the working-face on a level with the floor of the shovel-pit, and the other is to drill vertical holes about six inches in diameter with No. 14 Cyclone gasoline drilling-machines. Before the blasting is done, the ground is closely examined and a careful stadia survey is made to determine the toe and crest of faces and from developing slides, which are dangerous to life and equipment, and are expensive to shoot down. In actual practice 3.44 tons of ore have been broken for each pound of powder used, including that required for 'springing' or chambering the churn-drill holes. This figure was determined from accumulated records of the blasting of 530,600 tons of ore. The ore weighs about 160 lb. per cubic foot.

By the tunnel-method, the tunnels are driven into the face to a depth equal approximately to two-thirds the



BLOCK BEFORE BLASTING

BLOCK AFTER BLASTING

the working-face and the proper situation for the powder-chambers. An effort is made to ascertain the positions of the faults and also of the solid and loose material. The effect of these features on the result of the blast is anticipated. From the data thus secured a plan is drawn, and from this map a sufficient number of cross-sections is plotted to calculate the tonnage that will probably be broken by each charge of powder.

For a working basis, each pound of Trojan 40% powder is taken as having sufficient strength to break four tons of ore. This, no doubt, is an under-estimate of the strength of the powder, but it has proved advantageous to slightly overload the holes. This practice, to a degree, prevents the broken ore from hanging on the height of the ore above the powder-charge. From the main tunnels two sets of cross-cuts are made, one set at the rear of the tunnel and the other about 30 ft. back from the portal. The cross-cuts are driven to such a distance as will make the charges in the rear an equal distance apart for all tunnels. Two powder-chambers, one at each end of the cross-cut, are excavated in the back. In the front cross-cut four chambers are used. The powder-charges are placed about 6 ft. below the floor of the pit. About 20% of the total amount of the powder in each tunnel is placed in the front charges. These figures apply to ideal conditions only. Allowances are made for faults, hard and loose material, height of bank, and other things, so that the amounts of powder may be

proportioned accordingly. The advantages of the tunnel-system are: No springing is necessary before placing the powder-charges; the danger of premature explosions from hot walls, caused by chambering with powder is eliminated; the work can be done with less skilled labor; it is not necessary to build roads over difficult surfaces for the movement of heavy drilling-machines. On the other hand, tunneling into a low bank is as expensive as tunneling into a high one. When this method is used in banks less than 50 ft. high, the cost per ton of ore broken has been found to exceed the average.

FIG. 1. COPPER MOUNTAIN THE DAY BEFORE BLASTING

Churn-drill holes are placed about 50 ft. apart and are drilled to a depth of 6 ft. below the floor of the pit. After using different methods, the mine superintendent, Fred Eckman, is now using the following procedure when chambering churn-drill holes:

1. Use 28 sticks of powder, without tamping, to blow the hole dry, that is, to drive out the water.

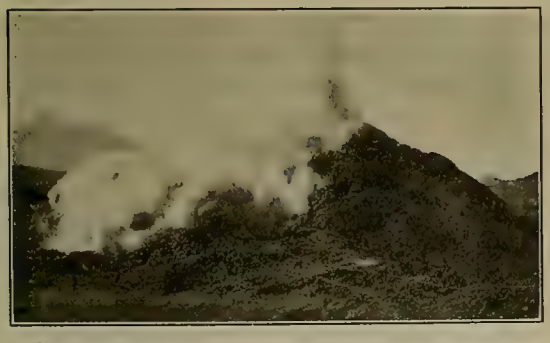


FIG. 3. APPEARANCE OF HILL FOUR MINUTES AFTER BLAST

2. Load the hole with 25 lb. of powder and 15 ft. of tamping. This charge is to enlarge the bottom of the hole to receive the final shot for chambering.

3. Load the hole with one-tenth the amount of powder that is to be used in the blast. If the hole is to be loaded with 80 boxes of powder then use 8 boxes for the chambering-shot; if 100 boxes are to be used, then 10 boxes will be required for chambering. About 40 ft. of tamping is used over the final chambering-shot. After each shot, time must be allowed for the walls of the hole to cool. Repeated tests of temperature are made by lowering a self-recording thermometer into the hole.

There are advantages in using churn-drills. The work can proceed without interference to steam-shovel operations, and where the working-space is limited greater quantities of ore can be prepared for blasting than with the tunnel-method. It is not necessary to wait until the ore already shot down is removed before the work of drilling for the next blast can proceed. Churn-drills have proved exceedingly satisfactory where the working-faces are not over 50 ft. high.

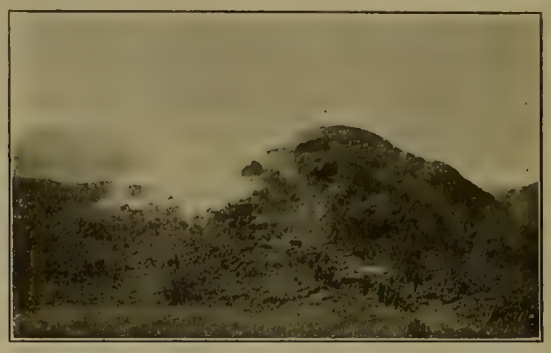

FIG. 2. VIEW AT THE MOMENT OF BLASTING

On account of the extreme hardness of the ore in the Ajo district, it has been found that after a depth of 40 or 50 ft. has been passed the cost per foot of hole drilled rapidly increases.

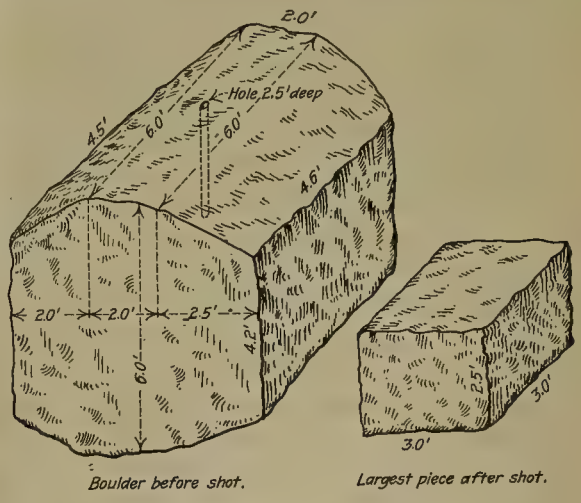

DIAGRAM REPRESENTING BLOCK-HOLING

In the process of excavating the ore in Copper mountain, it was estimated that 200,000 tons of ore was broken by a single blast. This was on February 28, at what is called 'No. 3 hill.' Seven holes were drilled with a churn-drill, each hole being six inches in diameter and 90 ft. deep, spaced 50 ft. apart. A total of 32 tons of 40% Trojan powder was used in the blast. That includes the powder used for springing. The appearance of the hill, as it stood the day before shooting the holes, is seen in Fig. 1. The illustration in Fig. 2 was taken at the moment of the blast, and Fig. 3 shows the effect

as revealed when the smoke had cleared away four minutes later.

All block-holing at Ajo is now done with the same grade of Trojan powder. The practice is illustrated in the accompanying cut and half-tone illustrations. In this particular case a block measuring approximately six feet in all three dimensions was drilled in the centre of one side to a depth of 2 ft. 6 in. Block-holes are loaded with two ounces of the granulated 40% Trojan powder. A fuse split at the end, and without a detonating cap, is next inserted, after which another two ounces of the powder is poured in and lightly pressed down with a wooden tamping-stick. The remainder of the hole is then tamped full of screened sand, and the charge is ready for shooting. In all cases the results are practically the same: the boulder immediately around the hole is completely shattered, while the lower half is split into pieces, the largest of which, in the case cited, is shown on the diagram.

Mexican labor is used for this work. One man with an Ingersoll-Rand BCR-430 jack-hammer can drill 100 holes, averaging 18 in. deep, in eight hours, making all his own air connections. These, as well as the powder-men for this work, are picked men, working most of the time without the direct supervision of a foreman. The labor is very satisfactory.

The drawing shows a common size of boulder in which four ounces of powder is used. If, by inspection, a boulder is approximately half as large, then only two ounces would be used; if twice as large, eight ounces would be required, and so on. At present the powder is stored in two stone buildings, one with a capacity of 200 tons, and one of 100 tons capacity, both about half a mile from the present steam-shovel pits. To date this has proved ample storage capacity for the amount of reserve powder required.

THE chromite production of the United States, according to J. S. Diller, of the Geological Survey, was 43,725 long tons, of which the greater part came from California. Oregon produced 7506 tons, and smaller quantities came from Alaska, Washington, Maryland, and North Carolina. This year the output must be greatly increased. The large consumers are paying $1.25 per unit for 38% ore, that is, $47.50 per ton, f.o.b. cars on the Pacific coast, on contracts extending through the year. A hopeful sign is that some of the large deep gold-mining companies are using parts of their stamp-mills, especially in Nevada county, for crushing and concentrating low-grade chrome ore. The ore sold on the Pacific Coast in 1917 ranged from 30 to 55% of chromic oxide; the average was about 42% for the total output, which sold during the year at an average price of $26 per ton. The total output for the first four months of 1918 is 17,693 long tons, equivalent to 14,862 long tons of 50% ore. That is less than one-third of the total domestic production expected in 1918.

ZINC-DUST is in steady demand, the price for immediate shipment being 14 to 16c. per pound.

Tropical Sanitation

Canal Zone sanitation was good during the first quarter of 1918, according to an official report. Malaria, which is the most important problem of the health department, has been almost extinct in the regular sanitated areas. Many weeks have passed during which no case has been reported. This condition is partly due to the dry season, but mainly to the cumulative results of years of unceasing vigilance and anti-mosquito work, classified as permanent work. Anti-malaria work, which consists of anti-mosquito work, is like fighting a smouldering fire which, if not constantly watched, may flare-up at any time the conditions become favorable. Such will be the case until the malaria parasite or its host is eliminated. Theoretically it is possible to eliminate the parasite causing malaria—more practicable than to eliminate its host, the anopheles mosquito. Elimination of the latter would involve the expenditure of enormous sums of money. Elimination of the parasite could be done by treating all human beings who are infected. The latter method of procedure is also expensive, but must be the goal sought, when, as with yellow fever, there shall be no more sources of infection. The 'aedes calopus' (stegomyia) still exists in Panama, but there has been no case of yellow fever for years. In the meantime the anti-mosquito work must go on as a local measure. The present corps of sanitary inspectors is deserving of great credit. The regular inhabited areas are in better condition than ever before. During the past quarter much permanent work has been done, consisting of additional sanitary ditches ad tile-drains. The total number of cases of malaria reported for the period, among employees, was 160. Of these, 20 are for the Zone proper, and 140 have occurred among employees engaged on plantations and in pasture-clearing camps for the Supply Department, outside of regular sanitated areas, in the jungle. What to do with these men is the problem. The breeding places about these camps cannot be eliminated on account of the temporary nature. The men employed are mostly native Panamans and Colombians, many of whom are 'carriers,' and furnish infected blood to the 'anopheles' mosquitoes, which, in biting 'non-immunes,' cause active malaria fever. It has been suggested that the streams near the camps be left shaded, that is, that vegetation be left uncut, making breeding of 'anopheles albimanus' unfavorable. The favorite breeding place of these insects has been found to be in water exposed to sunlight, especially where certain species of green algæ grow, and where fresh vegetation has been felled along the edge of the stream. It has further been found that 'anopheles malefactor' has not been incriminated as a host for malaria parasites, and thereby becomes of secondary importance. In each of these camps the district sanitary inspector has a trained 'mosquito catcher' who catches all mosquitoes found within the mosquito bars, removing a prolific number of infected mosquitoes. A large number of the bars in use at these camps are too short and do not furnish adequate protection.

The Company and Its Employees

By SIDNEY J. JENNINGS

*The company is a conception of the Roman law. In their time they had the 'collegium' and 'corporati,' which corresponded exactly to our company and stockholders. They had a common fund and could pursue a common object. In modern times the English are the nation which adopted this conception of joint stock companies in the largest degree and the number of companies grew to such an extent that an act called 'the bubble act' was passed in the English parliament in 1719 which declared joint-stock companies to be public nuisances. In 1855 the conception of limited liability, whereby the liability of the stockholder was limited to the amount he subscribed for shares, was introduced by the English parliament. In 1862 the Consolidated Companies act was passed by the English parliament under which the tremendous growth of companies and corporations has taken place both in England and in the rest of the world.

The company owes its vitality to the co-operative principle by which a multitude of small investors creates a fund to be used in the furtherance of a common object. This device has admirably served the purpose of absolutely and unmistakably determining the division of profits resulting from the joint action of those contributing to the fund.

The substitution of the company, which has been defined as a legal entity without a body to kick and no soul to damn, for a personal employer has, however, had certain tendencies which, when pushed to an extreme, have led to undoubted abuses on three classes of society. First, investors. Investors in a company with limited liability may entirely divorce the responsibility of how wealth is acquired from the actual possession of wealth. They thus tend to lose touch with their fellow-men. Second, managers are given great power with only a limited amount of accountability. Human nature cannot stand either too much prosperity or too much power and unless managers are called to account for their stewardship they lose their sense of proportion and their sympathy with their fellow-workers. Third, laborers: under company management, laborers tend to become cogs in a big machine and lose incentive to do their best. The human will is one of the most illusive of things, but the difference between having it work for you or against you is all the difference between success and failure. This fact has been most strongly brought to my attention by the statements of recent visitors from England who were interested in the labor problems there as they have been developing during the War. Statements were made by several manufacturers that partly-trained women who were keenly desirous of doing their best would produce from three to four times as much work as had previously been produced by skilled men who were only desirous of doing enough not to be dismissed.

Many methods have been suggested of correcting the above abuses which are admitted by most thinkers. Publicity of stock-ownership so that each individual shareholder could know who were his co-partners in any enterprise is one of the suggestions that seems to me to promise much toward placing the responsibility of the company's action where it belongs, that is, upon the stockholder. The requirement from the management of periodic reports to stockholders, giving a detailed account of their stewardship, will be corrective of many of the abuses of management. One of our largest corporations, the United States Steel Corporation, under the leadership of its chairman, Mr. Gary, has put in operation a plan for interesting its laborers in the success of the corporation by making them shareholders therein; this promises good results. Other corporations have found that their annual payroll was approximately the same as the capital necessarily employed in their business and the managements have decided that, after paying what they called the wages of capital—say, 6%, any profit above that will be divided equally between capital and labor, and thus so-called labor dividends are declared. A further suggestion for inducing the human will of the laborer to co-operate with the director in the success of an enterprise is the use of an employment manager. Considerable discussion has taken place on this subject and the results obtained in several plants have been reported to the Institute, but the suggestion seems to me fertile and capable of further expansion. We are no longer buying labor; we are selling employment, and our salesmanship is somewhat defective and must be improved. We no longer have a reservoir of idle hands from which to draw our laborers and the days of 'hiring and firing' are limited. Every man who is hired by a corporation is supposedly capable of working, certainly is desirous of working, and has the ultimate necessity of working in order to earn his living; therefore, it behooves us to find out where his capabilities can be profitably utilized and not merely allow the whim or temperamental objection of some foreman or the misunderstanding of the man himself to entail upon the company the large expense attendant upon the continual change of laborers.

I am one of those who think that the interests of capital and labor are identical, up to a certain point. They both want to produce wealth and they both realize that in order to produce wealth they must co-operate.

*Part of speech dilevered by the President of the Institute at Butte, Montana, on April 6, 1918.

It is only when it comes to dividing that wealth that their interests apparently diverge. For me, the ultimate basis of value is the emotion aroused in a person by the possession of the thing valued. Money is the most common, but it is by no means the only, yardstick by which the arithmetical expression of value can be made. If you have in one hand something that you value and a person offers you something else for it—be it either money, fame, renown, honor, or any other valuable thing in this world—you will take that which is offered you in the other hand and when that which is offered you arouses a greater emotion in you than that which you have, you part with that which you have and take that which is offered you. Recently a member of the Institute, and a friend of mine, came to New York and went through some of the large houses in New York where are accumulated treasures of our art, skill, and culture. He also went through, from top to bottom, many of the large department stores where goods of all kinds are gathered together to please the eye and mind and palate of men and women, and after seeing all this he came to the conclusion that the vast bulk of it was burdensome trash. Here is a state of mind with which we shall have to reckon when the War is over. We have got to realize now that much of what we now call wealth will seem to those returning men from the front nothing but burdensome trash.

Sit down with labor and its representatives and find out what it wants. Some of these men are reasonable; some are unreasonable, just as it happens in every other class. Don't let the laborer, partly for want of understanding on our part—we who form the captains, lieutenants, sergeants, and corporals of this great army of labor—fall into the hands of extremists who will lead him into every kind of mirage pictured by the Bolsheviki.

Mineral Imports at San Francisco

During the month of April, 1918, the following minerals and metals were entered at the port of San Francisco:

	Tons	Pounds	Value
Potash	....	480	$ 67
Potash salts	....	2,426	5,444
Sodium nitrate	1304	.....	47,773
Chemicals	....	.....	2,914
Chrome ore	1000	.....	11,000
Manganese ore	1035	.....	8,119
Tin bars	....	3,615,288	2,156,365
Tungsten ore	79	.....	108,765
Antimony	....	112,000	11,200
Lead ore (lead content)	....	108,187	995
Zinc dust	....	11,200	1,319

The total production of bauxite in 1917, according to statistics compiled by the U. S. Geological Survey, was 568,690 long tons, of which the Arkansas field produced 506,556 tons, and the Georgia-Alabama-Tennessee field 62,134 tons. Imports of bauxite amounted to 7760 tons, compared with 30 tons in 1916. The price of bauxite ranged from $4.75 to $10 per ton, and the average price was $5.48 per ton at the shipping point.

Industrial Development

By E. B. HOWELL

*In considering the probable industrial developments of the future, it will assist in clarifying the problem to consider what have been the industrial developments prior to the War. One hundred and fifty years ago the manufacturer was a person who made things by hand—by his own hands usually. He was the weaver by his loom, or the smith at his forge. If he prospered, he hired other workers who were called 'hands'. Why should they have been called 'hands' rather than 'heads'? For the simple reason that the boss was retaining the head-work, or management, for himself. The wage-earner was simply a hand. He was not expected or permitted to advise the management.

So long as the organization of industry was primitive and simple, this divorce between the manual worker and the management occasioned no trouble. The greater bulk of the population was agricultural anyway, and people living close to mother earth and directly deriving their sustenance therefrom have never bothered their heads with complicated industrial or social problems.

But with the invention of the steam-engine there came a great change in industry. The single loom was multiplied by hundreds. The forge was replaced by furnaces and steam-hammers. The manufacturer ceased to work with his own hands, and usually was a corporation. The number of hands employed was multiplied by hundreds and thousands. But there was one feature of the original primitive system that remained and has persisted to the present day—the manufacturer retained the management, the hands remained mere hands.

Several years ago I wrote an article for an Eastern journal entitled 'Labor v. Capital v. Management,' in which I tried to develop the thesis that management is a third element in the industrial conflict that should not be identified with either capital or labor. Often the capitalist has his grievance against the manager quite as well as the laborer. I think that if we bear in mind this third element of management, it will assist in clarifying the industrial problem. When one thinks of it, there is no reason in the nature of things why the people who furnish the capital to inaugurate an industry should manage it to the entire exclusion of those who have invested their manual skill therein. The latter have quite as vital an investment as the former. If the manual workers were in control and should tell the capitalist, a la Bolsheviki, that he was fired, that he could 'go chase himself,' or similar terms implying that his connection with the establishment was at an end, that capitalist, so fired, would have much the same feeling that a workman has who has been discharged from the only industry that he knows anything about, and perhaps faces the necessity of selling out his little home, and emigrating.

The industrial labor problem will never be solved

*Part of speech delivered on the same occasion as the preceding. Taken from the May bulletin, A. I. M. E.

until the right of the manual worker to share in the management of industry is recognized. It will never be solved until the wage-earner has some kind of a contingent financial interest in the enterprise. As it is now, there is continual warfare between labor-unions and their employees, sometimes suppressed only to break out again. The labor unions demand the highest possible wage, seemingly thinking that they are entitled to all that they can persuade or extort out of their employers, regardless of whether the business can stand it or not. Where the employer is compelled to pay the highest wage, he immediately recoups his loss from the general public, part of whom are the very wage-earners, by advancing the price of the commodity manufactured. The labor-union seeks only to get as much as it can of the fruits of the industry for as few hours' work as possible. It does not assume any of the burdens of making ends meet, of finding a market for this product, and of securing competent and faithful employees, that the employer has to shoulder.

The ordinary employer regards the efforts of the labor-union as an unwarranted interference with his own private business. He by no means recognizes the right of the manual worker to any part in the management of the industry. He has the feeling of the employer for centuries past: "I put up the money for this enterprise, I own it and have the right to manage it as I choose without interference."

The fallacy in this position does not appear where the employer hires only one or two hands. It begins to appear when he begins to monopolize a great industry in any particular place, and hires hands by the hundred or thousand. Then it begins to be apparent that he does not own the industry in the full sense of the term, that the State has an interest in the industry and in the welfare of the workers dependent on that particular industry for the livelihood of themselves and their families. When we recognize the interest of the State in industry, when we see that the workers who have acquired a manual skill therein have a real and substantial investment, then it follows inevitably that the exclusive management of industry by capital must some time have an end. Industry must become of the people and for the people just as surely as government itself.

After the War, I believe that labor will participate in the management of industry. I use the word "participate", because I do not believe the plan of socialism to exclude capital, or to exclude those captains of industry whom we call the management, will ever succeed anywhere, or ever even be tried in America. The Bolsheviki are giving an object lesson on this subject to the whole world. But the participation of labor in the management will solve the problems not only of labor but of capital. This participation will not come as a gratuity like so-called profit sharing. It will come as the manual worker's right—as the restoration to him of the birthright that unawares he lost when the steam-engine brought about a transformation of the industrial world in the 18th century.

I can imagine the keen highly trained manager at this point objecting: Must I associate with me in my work the unlearned, untrained, irresponsible, and sometimes dissipated men that come to me for work? Must I take orders from such men as these? And the capitalist may protest that his property should not be put at the mercy of employees. In every industry, there are probably employees who are unfit to participate in the management, but even their own comrades would not choose them for such a purpose. On the other hand, in every industry there are manual workers as intelligent, as fair-minded, and as just, as many of those now controling industry.

When labor acquires a contingent interest in industry it will be to the interest of the manual worker to help the enterprise to succeed. He will be an enemy of the slacker and shirker because the latter lessens his profits. He will be loyal, because loyalty will increase his own profits.

While I am sure some such change in industry is coming, I do not know just how it will come. Progress is wrought out quite as much as thought out. Perhaps it may come about by the creation of a new kind of stock for the corporations employing many hands, which one might call 'industrial' stock. Capital stock would go to the men furnishing the capital and industrial stock be set aside for those furnishing the manual skill and the brawn. Each kind of stock would have its representatives on the board of directors, and each would share in surplus profits. I use the term 'surplus profits' because there must first be paid out of gross earnings a reasonable interest on the money invested. These payments might absorb all the net earnings, but every successful corporation has its prosperous years when there is a melon to cut, and then the industrial stock would come in for its share of the extra dividends.

Popular government may not always have as efficient officers as autocratic government, yet none of us would for that reason want to go back to autocracy. What a democracy loses in efficiency it gains in a greater diffusion of well-being, and in the loyalty of the governed. An industry managed in part by its operatives may lose some of the cold-blooded efficiency of an industry managed by one autocratic mind, but if it ministers to the welfare of a greater number of people, if it substitutes loyalty for disloyalty, hope for despair, the honest toiler for the shirker, industrial peace for industrial warfare, then it marks progress.

INDIRECT TAXATION yielded $345,000,000 in England during the year before the War. Last year it produced a revenue of $510,000,000. The amount of direct taxes paid in the fiscal year 1913-14 was $465,000,000, and it rose to $2,330,000,000 last year. In other words, revenue derived from indirect taxation in 1913-14 represented 42% and that from direct taxation 58% of the total, whereas in 1917-18 indirect taxation yielded 18% and direct taxation 82% of the total. This means that the cost of the War was being paid by those enjoying surplus wealth.

Treatment of Manganese Ores

In a recent bulletin issued by the University of California, entitled 'The Possible Treatment of Manganese Ores in California,' E. A. Hersam, associate professor of metallurgy in the University, gives the results obtained in preliminary studies conducted under his supervision. These tests are of special interest at the moment. Electrostatic separation gave negative results, the silicious constituents of the ore being thrown into the concentrate to a serious extent, while the magnetic oxides failed, in part, to respond to the electrostatic force. Magnetic separation, however, showed considerable promise. Most manganese minerals yield to treatment on a Wetherill machine, and afford good products when fed with ore that has been closely sized. Classification by screening alone also effects considerable concentration. In an ore from Patterson, California, the 200-mesh material contained about twice as much manganese as the grade between 40 and 48 mesh. The treatment of the finer sizes by magnetic separators generally show a low percentage of recovery. The following table presents the results obtained by magnetic separation applied to the 40% grade.

	Weight of product, per cent of original ore	Mn in product, %	Mn content based on original ore, %	Per cent of total manganese in original ore
Readily attracted	9.9	38.7	3.9	12.1
Less readily attracted...	26.3	39.6	10.5	32.6
Least readily attracted..	32.9	40.2	13.4	41.4
Not attracted	30.9	14.6	4.5	13.9
	100.0	....	32.3	100.0

The indication is that a readily attracted hard high-grade material is present in the ore, and that a soft low-grade constituent, less strongly attracted, escapes with the tailing, thereby increasing its grade. In so far as part of this soft material is caught in the concentrate the grade of that product is lowered. Much of this softer constituent consists of pyrolusite and other manganese minerals containing silica, and inseparably mixed with the gangue in the process of dry grinding. Magnetic separation applied to carbonate ore showed a recovery of 96.7% of the manganese in a concentrate assaying 38.6%, leaving a tailing that held 3.3% of the metal that had been present in the original ore, which in this case carried 1.9%. Calcination of the carbonate ore resulted in a magnetic concentrate assaying 50.9% Mn, leaving 6% of the original metallic content in the tailing. It appears that the roasting and re-treatment of the tailing offers an opporunity to effect a high saving in the magnetic concentration of manganese ores.

Flotation proved unfavorable. Ores from Patterson and Davenport, California, were tested, using pine oil, crude pine oil mixed with tar oil, and crude petroleum, 14°B., from the McKittrick field. The Patterson ore, assaying 37.7% manganese, yielded, with the three flotative agents respectively (*a*) 18% of concentrate containing 34.3% manganese, (*b*) 30% of the weight of the ore as concentrate assaying 38.94%, and (*c*) a concentrate assaying 38% manganese and a tailing with 36.8% of the metal. The Davenport ore gave results equally unsatisfactory.

Gravity concentration, that is, with jigs and tables, is effective only when the minerals are hard and pure, and break free from the gangue. The fine material obtained by classification is difficult to concentrate by any method. Magnetic separation appears to offer the larger possibilities for successful treatment of ores of manganese.

Concentrating Lead Ores at Kellogg, Idaho

The Bunker Hill & Sullivan report for 1917 gives the following details of milling:

Mills working, days	356
Ore milled, tons	493,030
Ore milled per 24 hours, tons	1,386
Assay of feed, lead per cent	10.6496
Assay of feed, silver ounces	4.3170
Lead content, tons	52,506
Concentrates, tons	103,982
Assay of concentrates, lead per cent	45.1967
Assay of concentrates, silver ounces	16.2794
Lead in concentrates, tons	46,996
Lead recovery, per cent	89.51
Silver in feed, ounces	2,128,437
Silver in concentrates, ounces	1,692,765
Silver recovery, per cent	79.54
Cost per ton milled, cents	60
Cost per ton of concentrates	$2.846

THE GREAVES-ETCHELL electric furnace is of the 3-phase type, two of the electrodes being introduced vertically through the roof, while the whole hearth acts as the third. Three single-phase transformers supply the energy. Their primaries are connected in delta, and their secondaries in star with unequal legs, the proportion being so calculated as to give a balanced load on the primary mains when the upper electrodes are in equal adjustment. If one of the arcs breaks, the others are not affected and an overload on one arc is eliminated. Furnaces are made in standard sizes ranging from 10 cwt. to 10 tons. The smaller furnaces are rectangular and the larger ones circular in plan. An arrangement of compensating rollers allows the spout to travel downward in a vertical line, so that the ladle need not be moved.—'Electric Review', London.

THE STEEL INDUSTRY has been advised by the Committee on Steel and Steel Products to restrict the use of chrome ore for direct refractory purposes to a maximum of 1½ lb. per ton of open-hearth ingots; that it purchase for the above purposes only domestic or Canadian ores containing not to exceed 38% chromic oxide, nor more than 35% chromic oxide as an average, and that each carload be considered as a separate unit for analysis. The committee recommends that the use of chrome-brick and chrome-cement do not exceed the equivalent of a maximum of ½ lb. of chrome ore per ton of ingots. The Committee urges that every effort be made to find substitutes for chrome ore for refractory use in open-hearth steel-making, with a view to effecting the maximum possible reduction in the use of chrome ore, without curtailing steel production.

The Groch Flotation Machine

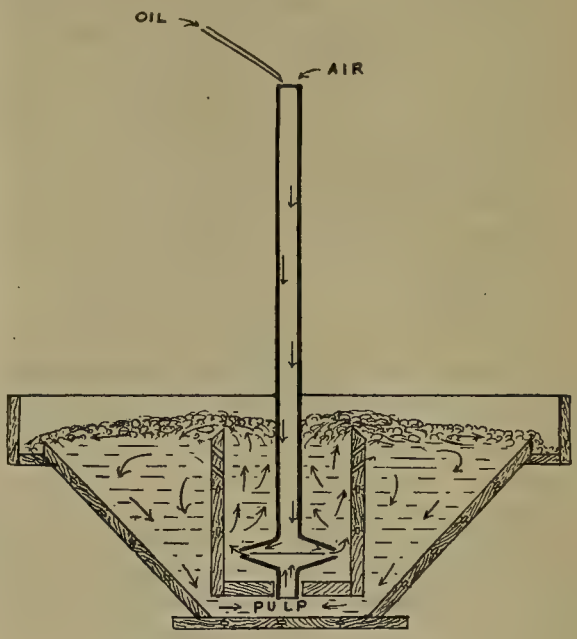
By F. O. GROCH and W. E. SIMPSON

*Flotation is of two classes: (1) the surface-film, or dry-ore class, in which the ore in a dry state, and crushed to the requisite fineness, is gently placed on the surface of slowly moving water, a separation being effected because of the tendency of valuable mineral particles to resist being wetted with water and to remain on the surface, while the valueless gangue particles sink, and (2) froth-formation, or the wet-ore class in which advantage is taken of the comparative ease with which the valuable mineral particles, already wetted, repel or shed the water from their surfaces under the mysterious influence of some froth-forming agent, generally an oil, and attract bubbles of air or other gas with which they may come in contact, forming, in the pulp in which they are immersed, a buoyant association which rises to the surface as a froth or scum. The Groch appliance is of the froth-forming type.

Froth-forming flotation machines may be considered as of two kinds, distinguished from each other by the method employed in bringing the air or other gas into contact with the flotative minerals. The pneumatic machines aerate the pulp under treatment through canvas floors, while the mechanical appliances perform the same function by means of impellers. The Groch machine is of the impeller type.

From the metallurgical standpoint, the best results are obtained when the three essential constituents of a flotation-froth, namely, the oil, the air, and the mineral particles, are all in a minute state of subdivision but, for commercial reasons, it is advisable to avoid excessive pulverizing of the ore, not only on account of the prohibitive cost, but also because of the difficulty of profitably disposing of an extremely fine product destined for the smelter. As regards the oil and air, however, no such disadvantage exists, the object of all flotation-machines being, in fact, to disperse and subdivide these to the greatest extent obtainable. In this operation the Groch system is especially efficient.

The Groch centrifugal flotation machine has a number of impellers operating in a 'V' box 14 ft. long by 5 ft. wide, and divided both longitudinally and transversely into compartments. By means of submerged and slotted partitions, the pulp during treatment is made to take a zig-zag course both vertically and horizontally in its passage through the machine. A cross-section shows three compartments; in the central one operates the centrifugal impeller, which is the chief distinctive feature of the invention. Each impeller is a vertical hollow shaft with a centrifugal 'runner' at its lower extremity, having hollow hubs and being subdivided horizontally by a metal disc so as to operate after the manner of a pair of centrifugal pumps. This class of impeller combines the functions of an emulsifier, an agitator, and an aerator simultaneously, thereby eliminating any necessity for auxiliary appliances, and making each individual machine complete and independent. When in operation the 'runner' is completely submerged in the pulp, while the hollow shaft, to which it is attached, is the medium through which the power is transmitted to effect rotation. The pulp enters the zone of treatment in the central compartment from underneath a false floor through which the lower hollow hub of the impeller protrudes. It is here sucked up into the interior of the lower section of the 'runner', and ejected centrifugally at the periphery in a horizontal plane, rising upward in the central compartment by displacement until it overflows into the compartments on either side. All round the zone of discharge, at the periphery of the 'runner', a vacuum



SECTION OF THE GROCH MACHINE

is created similar to that caused at the nozzle during the operation of an ordinary steam-injector. With the standard impeller it is found that the vacuum becomes measurable when the speed reaches 200 r.p.m., increasing to a degree equal to $2\frac{3}{4}$ in. of mercury at a speed of 450 r.p.m., and 6 in. at 750 r.p.m. Into this vacuum the content of the upper section of the 'runner' is drawn automatically, and, as this part of the impeller has its inlet from the top of the hollow shaft, the result is that an enormous supply of air is continuously ejected as a horizontal layer into the pulp. This air-layer, as it recedes from the centrifugal centre, must, because of its ever increasing diameter, eventually become so thin as to break into a shower of infinitessimally small bubbles. According to current theory, this is precisely what is wanted for the most effective work in flotation. Through the hollow shaft, also, oil is admitted drop by drop into the area of treatment, each drop falling from a height and, striking the rapidly revolving interior metal disc, becomes mi-

*Abstract: Canadian Min. Inst., March 1918.

nutely dispersed. To use a trade expression, the impeller is really an 'atomizer', reducing the air-bubbles to nearly molecular size, and spraying them with oil, thereby rendering them highly adhesive to the mineral particles with which they come in contact. If it be assumed, as is generally believed, that successful flotation is the result of intimate mechanical contact between the flotative mineral and the buoying agents, then, by this system, ample opportunity is given for repeatedly making such associations, for, at each impeller, the shower of minute air-bubbles forms, as it were, a horizontal barrage through which the mineral particles must pass on their way through the machine. An equal advantage might also be claimed if, on the other hand, it be assumed that the gas-bubbles, in order to be effective, must be nascent, or be generated from the solution, each mineral-particle becoming the nucleus for the creation of the bubbles in embryo. In the Groch system the air-bubbles, on being discharged from the impeller at depth, tend to become absorbed in the pulp to the extent of saturation at the pressure to which they are momentarily subjected. With this pulp traveling upward, the pressure becomes reduced, and consequently a state of super-saturation must be reached, with the liberation of nascent gas-bubbles. In any case it would be expected that the union of the gas-bubble and the mineral, under pressure, would be of a stronger type than if no such pressure existed. Once united, the association becomes increasingly buoyant on being brought toward the surface, for the reason that, when the pressure is thus released, the buoying gas-bubble increases in size through expansion, in accordance with well-known natural laws. The Groch machine eliminates the disadvantage, common to machines using the blade-type of impeller, of having to beat the air into the pulp by the creation of a deep vortex, a system wasteful of power and inefficient in operation. A study of the ordinary cream-separator leads to the belief that, with such a type of machine, the tendency is for the froth or 'cream' of the pulp to collect on the inner surface of the vortex, where it is not wanted.

As illustrating one of the best grades of product that the Groch machine can deliver, it may be mentioned that, in the case of a molybdenite ore treated experimentally, a concentrate was obtained assaying 99.34% MoS_2, a performance that leaves but little room for improvement. Furthermore it is claimed that, in the treatment of a silver ore at Cobalt, a 10 days' run with a Groch machine gave a 5½% higher recovery than that obtained with other systems; at the same time, the concentrate was of a higher grade. A low power consumption is also claimed, the standard machine, with six impellers, having a capacity of from 35 to 75 tons per day, depending on the class of ore being treated, showing a consumption of 7½ hp. by actual determination.

FREE ZIRCONIUM exists in three forms, namely, amorphous, crystalline, and graphitic. The crystalline form, with a density of 6.4, has a melting-point of approximately 2350°C. Only two minerals can be considered as commercial sources of zirconium: the natural oxide and the silicate. Natural zirconia contains 84% of the pure oxide, with 8% of silica and 3% of oxide of iron. Purified zirconia is a white substance with a density of 5 and, according to Weiss, a temperature of fusion of 3000°C. The first important application of the oxide of zirconium was as a substitute for the cylinders of chalk in the Drummond light. This oxide was employed in the manufacture of incandescent gas mantles, but was later superseded by thorium oxide, which gives equally good results at a lower temperature. Another application was effected in 1887 in the production of the Nernst lamp. Mixed with 10% of magnesia, with a binder consisting of starch, phosphoric acid, and glycerin or its borates, a product is obtained impermeable to liquids and unaffected by strong or fused alkaline mixtures. Its uses in metallurgy are promising. In trials of a Martin electric furnace in a steel works at Remscheiden, Germany, a lining of zirconia was found in good condition after a run of four months' service without repair.

Tin Deposits in Virginia

One of the most promising American tin deposits is in the Irish Creek district, in the eastern part of Rockbridge county, Virginia, near the summit of the Blue Ridge. This deposit was recently examined by H. G. Ferguson of the U. S. Geological Survey, acting in cooperation with the Virginia Geological Survey. Mr. Ferguson's report has been published as Bulletin XV-A of the Virginia Geological Survey. The existence of tin in the Irish Creek district has been known for many years. Between 1883 and 1893 the deposit was actively worked. The company, however, became involved in litigation over land-titles and abandoned the enterprise in 1893. Operation was never resumed, and the old workings are now caved so that a thorough examination is difficult, but Mr. Ferguson concluded that the deposits along the Blue Ridge in this vicinity offer some promise as a source of tin, both through the systematic working of the known veins and the possible discovery of other deposits. The cassiterite occurs in quartz veins that traverse a hypersthene granodiorite. The veins do not persist for long distances and their tin content is irregular. Some high-grade ore has been found, however, and some tungsten occurs with the cassiterite. A copy of the report may be obtained on application to Thomas Leonard Watson, director of the Virginia Geological Survey, Charlottesville, Virginia.—'Manufacturers Record.'

BINOCULARS and field-glasses are desired by the Navy Department, owing to the scarcity of such instruments for the use of officers. Individuals owning suitable glasses are requested to send them by registered mail to the Navy Department at Washington, or to the nearest naval recruiting station. A receipt and $1 will be sent by the Assistant Secretary of the Navy, and the instrument ultimately will be returned to the owners, if they survive the mishaps of war.

Concentrating Carnotite Ore

By K. L. KITHIL and J. A. JONES

*The principal deposits of carnotite (a radium and uranium-bearing ore), so far as now known, are confined to a well-defined area lying in the south-western part of Colorado and the south-eastern part of Utah.

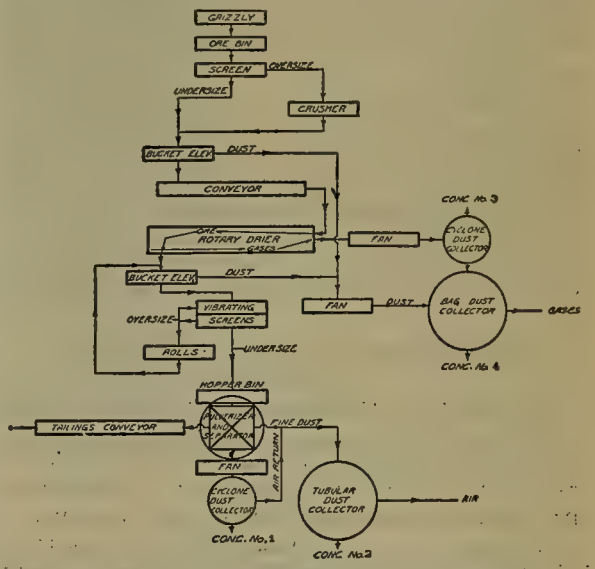
The milling operations to be described are those of the National Radium Institute. All of the claims worked by the Institute were leased on a royalty basis from the Crucible Steel Mining & Milling Co., a subsidiary of the Crucible Steel Co. of America. Of the claims leased, 11 were in or near Long Park, Montrose county, Colorado, 6 were in the Hydraulic district, same county, and 10 were in the vicinity of Sawpit, a station on the Rio Grande Southern railway, a few miles west of Telluride, San Miguel county. The last-named claims contain no carnotite, but vanadium solely. Of the carnotite claims, only those in the Long Park group were mined, all the ore required being obtained there.

At many carnotite mines it is the custom to sort both the ordinary shipping ore and the high-grade ore into several grades. At the Long Park claims of the Institute so-called high-grade ore was discovered in such inconsiderable quantities that no separate classification was made, except on the Maggie C. The ore was therefore sorted to two grades only: milling ore, running from 0.5 to 1.25% U_3O_8, and shipping ore, averaging 2%.

As carnotite partly forms the binder between the sand grains of the sandstone, it must be separated from these grains in order to concentrate it. Consequently the ore should be reduced to about the fineness of the sand grains. Care must be taken that as little as possible of the silica is ground to powder, as the concentration depends largely on the removal of fine or slime from the coarser material. Some of the carnotite adheres tenaciously to the surface of the sand grains and can be liberated only by attrition or elutriation. In order to concentrate the fine or slime, which contain most of the carnotite, either the wet or dry method can be used. In the former, advantage is taken of the difference in rate of settling of various sizes of the agitated material, followed by decantation and final settling of the slime, which forms the concentrate. Dry concentration suggests the use of air to blow or suck the fine from the coarser particles. A complete description of the dry methods used in the concentration mill of the Institute are given in the following notes.

It was found that after the ore had been ground to 80-mesh or finer all of the carnotite could not be entirely liberated by ordinary means. In order to save this carnotite a special attrition apparatus was constructed whereby the adhering carnotite was rubbed or scraped from the silica grains mechanically by passing the ground ore between a pair of discs, on one of which was a number of stiff wire brushes.

The course of the ore through the mill is indicated by the flow-sheet. The grizzly-bars were spaced 1¼ in. The larger pieces of rock were broken with a hammer. Waste was discarded. From the ore-bin the ore was fed mechanically onto a ½-in. screen placed at an angle of 45°. The oversize dropped into the crusher, the jaws of which were set to make a ½-in. product. The undersize dropped through a chute into the boot of elevator No. 1, as did the material passing through the crusher. The material discharged from the elevator was carried by belt-conveyor No. 1 across the building and dropped through a pipe into the feed hopper of the rotary drier. In passing through the drier the ore was repeatedly lifted by the shelves within and poured through the hot gases coming from the fire-box at the lower end. Considerable dust was liberated, which was carried with the gases and steam



FLOW-SHEET OF A CONCENTRATING PLANT FOR CARNOTITE ORE

into the smokestack. To save this dust all gases and steam were drawn off by the fan through the pipe connected with the smokestack and blown into the cyclone dust-collector. Through a pipe at the lower end of this collector the separated dust was drawn off. This dust formed concentrate No. 3.

Dust from carnotite ore has a relatively high uranium content, and is very irritating to the nose, throat, and lungs, therefore health consideration alone necessitated the use of fans and dust-collecting devices.

Considerable very fine dust carrying carnotite escaped through the opening at the top of the cyclone separator, and was blown through another pipe into the dust-collector, or bag-house. The dust so collected formed concentrate No. 4. The dried ore left the drier at its lower end near the fire-box and discharged into the boot of elevator No. 2. The hot ore was elevated to the vibrating screen, where the screw-conveyor distributed it equally over the screening surface. The oversize of both the ½-in. and 10-mesh screens fell through pipes into the feed-hoppers of the two sets of rolls; the undersize passed through a chute to the storage-hopper of the Raymond mill.

The oversize, after passing the rolls, dropped again

*Abstract from Bull. 103, Mineral Technology 11, U. S. Bureau of Mines, 1917.

into the boot of elevator No. 2, and was returned to the screen until all of it passed through the 10-mesh screen. The ground and dried ore from the storage-hopper was automatically fed into the pulverizer chamber of the Raymond mill, when the carnotite was separated from the silica grains, as already described. The tailing, which automatically discharged from the pulverizer, dropped onto the tailing conveyor and was carried to the dump. The tailing was practically free from carnotite dust.

The blower-fan connected with the boots of No. 1 and 2 elevators drew off the dust from these points, and blew it into the dust-collector already described. It is essential in concentrating carnotite ore by the dry method that all apparatus be so enclosed and connected with each other as to make the entire unit dust-proof, for all dust created in the mill contains carnotite and is part of the concentrate.

The relative proportions of the four concentrates obtained in operating the mill were approximately as follows: No. 1 concentrate, 88%; No. 2, 2%; No. 3, 7%; and No. 4, 3%. The ore averaged 0.85% U_3O_8, and the four grades of concentrates 2.91, 3.55, 2.76, and 3.44% U_3O_8, respectively. Tailing averaged 0.37% U_3O_8. The ratio of concentration was 6:1. The cost of concentration was $20.41 per ton, delivered at the mill warehouse.

Production of Phosphate Rock

The phosphate-rock industry, which suffered severely in 1915 and 1916 from the War, made a strong recovery in 1917. In spite of the shortage of railroad cars and fuel-oil that affected the output of the Eastern fields, the quantity of rock marketed last year, according to R. W. Stone, of the U. S. Geological Survey, was 2,584,287 long tons, valued at $7,771,084, compared with 1,982,385 tons, valued at $5,896,993, in 1916.

The output by States is shown below:

State	Quantity, tons	Value
Florida	2,022,599	$5,464,493
South Carolina	33,485	138,482
Tennessee, including a little from Kentucky	513,107	2,126,353
Idaho, Utah, and Wyoming	15,096	41,756
Total	2,584,287	$7,771,084

As a result of the falling-off of the foreign demand at the beginning of the War, our output of rock fell from 3,000,000 tons per year to less than 2,000,000 tons in 1915 and 1916. Before the War exports were nearly half the domestic production, but in 1915 they decreased from 1,250,000 tons, the quantity usually exported before the War, to only 250,000 tons, and were only one-seventh of the domestic production. In 1917 exports were 166,003 long tons, or only 6% of the quantity marketed. The rock exported went principally to Spain, France, England, Ireland, Scotland, Canada, and Cuba.

A notable feature of the year was the increase in production in the Western States, where there are now four producers instead of only one or two and the output was considerably greater than in any previous year. It is expected that the output from the Rocky Mountain phosphate fields will continue to grow, as the rock is high grade and abundant, and the demand for it should increase as the country on the Pacific slope is developed.

The demand on the United States to supply food not only for herself but for her Allies, in larger quantity than ever before, means intensive agriculture and the use of great quantities of fertilizers. Phosphate rock should be produced in 1918 in greater quantity than in 1917, and the output may approximate pre-War tonnage.

Alloys of Manganese

Manganese is used in the steel industry in the form of two alloys, ferro-manganese and spiegeleisen. These are both alloys of iron, manganese, and carbon. Ferro-manganese may contain as much as 80% of manganese, but averages in this country about 70%. In spiegeleisen the percentage of manganese is much lower; the standard figure upon which the price is based is 20%. The average manganese content is about 18%. Both alloys are high in combined carbon, the amount of which runs to 7%. The manganese alloys are added to molten steel from the converter, or open-hearth furnace, for the purpose of introducing both manganese and carbon. The manganese cleanses the steel by combining with the contained oxygen and, to some extent, with the sulphur, and then carries these impurities into the slag. The carbon is for the purpose of giving the steel the required hardness and strength. By adding larger amounts of the alloys, manganese steel is produced, which is noted for its hardness, tenacity, and durability. It is much used in the wearing parts of heavy machinery. In recent years the tendency has been to use more ferro-manganese and less spiegeleisen, on account of the much smaller amount of ferro-manganese that it is necessary to add to the steel. Spiegeleisen usually has to be melted in a cupola furnace before using, but ferro-manganese can be added direct. The latter also introduces less carbon, which sometimes is an advantage.

Ferro-manganese and spiegeleisen are produced by smelting a mixture of manganese ore and iron ore in an ordinary blast-furnace. A high temperature is required and the amount of fuel used is much greater than in iron smelting. A considerable amount of the manganese goes into the slag. The slag from a ferro-manganese furnace may contain as much as 10% of manganese. A considerable tonnage of the iron manganese alloys is now produced in the electric furnace.—Manganese Circular, Colorado School of Mines.

BARIUM CARBONATE is in great demand in England, where it is now selling as high as $170 to $196 per ton. Great Britain formerly depended on Germany for its supply, and it is said that the United States may permanently control this market if steps be taken to produce the precipitated carbonate in sufficient quantity.

BARYTES deliveries are greatly impeded for lack of cars. Spot prices average from $22 to $24 per ton for off-color grades, and from $28 to $36 for domestic, pure white, floated.

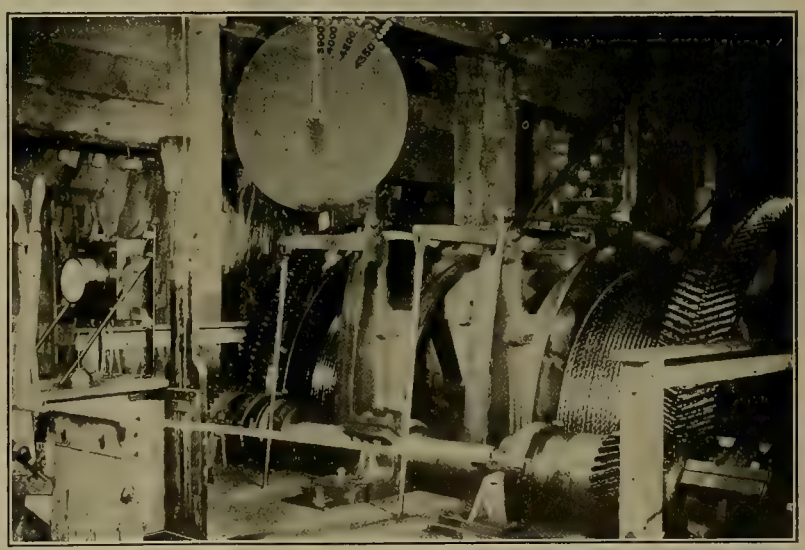
Hoisting by Stages From Deep Mines

By R. A. BALZARI

When a mine is producing ore and is being extensively developed below a vertical depth of 4000 ft. the hoisting problem becomes serious. The difficulties have been thoroughly studied on the Rand, in the copper country of Michigan, and in Europe. Without entering into technicalities, the question is whether it is best to use an engine capable of hoisting direct from great depths, or to hoist by stages, that is, with one engine at the surface and another, say, at 4000 ft., where ore-pockets filled by the lower hoist in turn fill skips of the upper hoist. The surface engine may be air, electric, or steam-driven, but the lower one can only be actuated by air or electric power.

ROPE-DRIVE OF UNDERGROUND HOIST AT ARGONAUT MINE, CALIFORNIA

In California there are some deep mines, notably the Argonaut, 4650 ft. deep on the incline; the Kennedy, 3950 ft. vertical; and the North Star, 6300 ft. on the incline. While no great quantity of ore is hoisted at any of these, the amount being about 500 tons daily at the Kennedy, yet the problems presented have been of interest, especially at the Argonaut. When this mine became so far developed that it was necessary to go deeper than 4500 ft., the engineers were confronted with the problem either of taking out the hoist at the surface and putting in a larger one, or of placing a relay-hoist at the 4000-ft. level to work in conjunction with the one at the surface. It became evident that if the surface hoist were taken out and a larger one put in, it would be necessary to cease operating for a considerable etim, owing to the fact that the only available point for the new engine was on the same foundation, this being due to the site of the Argonaut shaft with respect to the road and adjacent hill-slope. A 1⅛-in. rope is used. As the shaft is crooked and has a tendency to slip, it was found that a larger rope would be subject to wear, increasing the expense abnormally. Also, if the hoist were to work to a lower depth than 4000 ft., it would be necessary to increase the speed of winding, which the condition of the shaft would not permit. In other words, it would have been necessary to sink a new shaft if a surface hoist capable of



UNDERGROUND HOIST AT THE ARGONAUT MINE, CALIFORNIA

hauling from a depth of 7000 ft. were to be used; consequently it was decided to place a relay-hoist at 4000 ft. to supplement the hoist at the surface. It was also found that the cost of operating two hoists would be lower than working one large machine on the surface, taking into consideration the shut-down while the change from the present hoist at the surface to a larger one was being made. Moreover, it is found more satisfactory to conduct development work with a small separate hoist than to use the surface hoist for this purpose, the consumption of power being lower.

The hoist used at the surface was made by the Knight Engineering Co., of Sutter Creek, California, from a design perfected about 20 years ago, and is still giving good service. It is operated by a 500-hp. Westinghouse phase-wound induction-motor, which, in turn, is controlled by a liquid rheostat. The equipment on the surface is capable of hoisting from a maximum depth of 4500 ft., raising the skip and four tons of ore at a speed of 820 ft. per minute. This is a double-drum balanced-hoist.

The underground hoist is of the double-drum balanced type, built by Knight & Co. of Sutter Creek. The drums are 72 in. diameter and 27-in. face, with a single gear-reduction to the pinion-shaft in a 5:1 ratio. Mounted on this is a rope-sheave and brake-drum. The brake is of the post type, and is operated by a foot-lever from the operator's stand. The standard type of level-operated jaw-clutch is used on the pinion-shaft for throwing each drum into connection. The drums are also connected by hand-operated lever-brakes on the engine-man's platform. The hoist is driven by a 225-hp., type CW, 3-phase, 60-cycle, 220-volt, 495-r.p.m. Westinghouse motor. It is connected to the hoist by a continuous manila rope-drive, consisting of ten 1¼-in. ropes, kept taut by a tension-carriage designed by Meese & Gottfried of San Francisco. The control for this motor consists of a No. 1 liquid rheostat for the secondary and the type F magnet-switch control, which totally disconnects the motor from the line when the switch is opened as a primary control. Brass cooling-coils are used in the rheostat to prevent rapid deterioration due to acid that might be present in the mine-water, which is used for cooling and make-up. It is necessary to add a small amount of soda to make the correct density of electrolyte, owing to the natural salts in the mine-water.

The temperature at 4000 ft. ranges from 90 to 93°, and the atmosphere is quite humid. It is necessary to impregnate the coils of the motor against moisture, also all coils operating the electro-magnets on the switchboard, and all other parts likely to be affected by the dampness. After 17 months' operation there has been no trouble from this source. In case the plant is stopped for a considerable period, it is necessary to dry thoroughly all the switch-gear before starting, as the accumulation of moisture is inclined to cause trouble through leakage over the surface. The switches themselves during operation keep warm and dry enough.

The switchboard carries a circuit-breaker, and also a graphic recording watt-meter. Directly in front of the operator is a long-scale ammeter, which shows how much current is being drawn from the line, and enables him, in this manner, to regulate the acceleration and to keep the current drawn to a minimum. The operating cycle for this hoist is laid out on the following basis: The skips weigh 2500 lb., and carry 5600 lb. of ore each. The speed of the skip is 800 ft. per minute. The size of the rope used is 1⅛ in. The accelerating time is 20 seconds, retarding time 10 seconds, and loading time 30 seconds. Dumping is done during the time the skip-tender at the bottom of the mine is riding from the chute up to the station and getting off at that point, consequently no time is allowed for discharging. The amount of ore to be handled from the lower part of the mine is 300 tons per day, plus 600 to 800 tons of waste, and 50 tons of water.

A point of interest in maintenance is the fact that all the rope used on the lower hoist is taken from the engine at the surface. This is made possible by the fact that the rope, when operating over a depth of 4000 ft., will become worn to such an extent that it cannot be further utilized. It is quite safe for a considerable time on the underground hoist, and it is found that there will be enough rope obtainable from the surface to keep the underground plant in operation without the purchase of new rope for the relay-hoist.

This is probably the first 2200-volt motor to be used in hoisting at any considerable depth underground, and it is considered that this pressure will prove satisfactory. Every precaution has been used to protect employees against injury from the high voltage, which is taken directly from the bank of transformers at the surface and brought to the hoist by three conductors in a leaded and armored cable. The cable is of sufficient size, being No. 0, to allow of hoisting being started under a heavy load without a severe drop in the line-voltage at the motor.

The engineer at the Argonaut, V. S. Garbarini, arranged for and supervised the erection of this equipment.

HYDROLYSIS in a 0.1% cyanide solution, according to James Moir, does not in practice amount to more than 3.4%. These figures are based on a cyanide strength calculated as KCN. Other investigators have concluded that the hydrolysis amounted to 5.4%, while an earlier study by Mr. Moir had given an average of 2.4%. An elaborate investigation of the solution of gold in cyanide is being undertaken by Worley and Browne in South Africa, and this subject will receive more extended treatment by them.

BISMUTH is used largely in the form of bismuth salts for surgical dressings. Important amounts now go to waste in the smelting of lead and copper ores, the recovery of which is greatly desired by the Government. The imports have declined from a former high level of 164,793 lb. to 69,250 lb. in 1917.

MICA SCHIST containing large quantities of mica is resistant to high temperatures, and is recommended as a lining for furnaces.

REVIEW OF MINING

DENVER, COLORADO

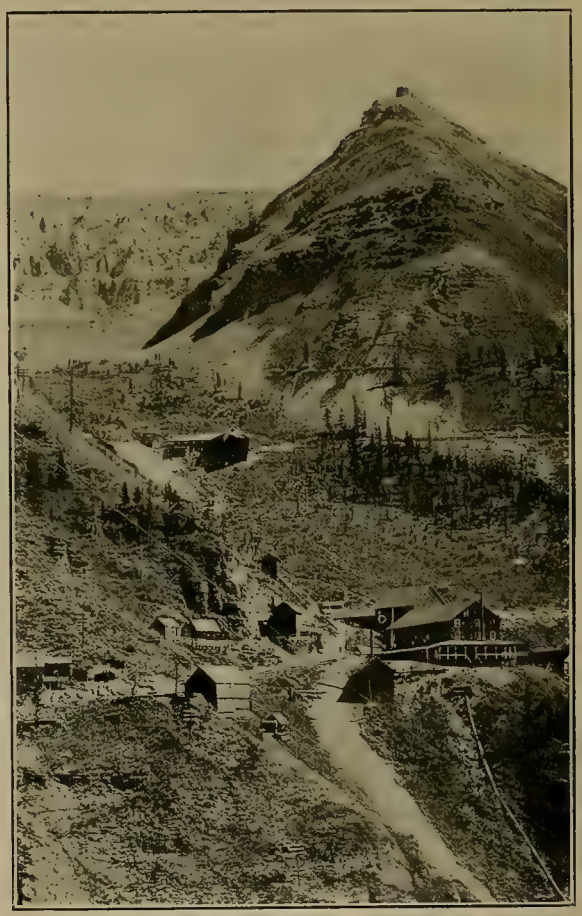
General Mining Situation.—Tungsten, Fluorspar, Silver, Oil-Shale.

A study of mining in Colorado leads to the conclusion that conditions are better than they have been for years past. There are persons who speak pessimistically concerning the status of mining (especially metal mining), but the fact remains that districts whose activities continued throughout the long period when low metal prices prevailed are now making unusually good showings, while old centres that could not resist the depressed prices have taken on new life that is indeed significant. There are few attempts to develop new districts or even to open new mines in old districts. When an investor who might undertake such things is approached he shies away from the proposal by saying that he prefers to put his money into a property whose merit has been proved by past production, even with correspondingly depleted reserves. Assumption of this attitude is explained in various ways. One excuse is that national conservation demands us to make every old worthy mine produce to its complete exhaustion. One man will explain that this is not a time for developing new districts because this might entail the extension of railroads. Another prefers to undertake operations in an old but equipped property because of the present difficulty in securing machinery. Although prospectors come to Denver with tales of discoveries in remote parts of the mountains, deaf ears are turned to their schemes, especially if the reported finds are of the precious or common metals. Notwithstanding attractive opportunities continually presented for engaging in operations in both old and new mines, interest certainly lags, primarily because of war conditions calling for the utmost conservation on the part of investors whose readily available cash resources are held at the call of the country. To such men the idea of large profits is not nearly so attractive as it was prior to the start of income and excess-profits taxation. Furthermore, recoverable profits from mining are not now measureable by the relatively high prices of metals. Enhancement in metal prices is more than discounted by the scarcity and high price of labor, supplies, and increased freight rates.

All of us recently have probably heard more or less grumbling from goldfields. The Cripple Creek 'Times' calls upon Federal legislators to do either of two things, namely, to place a war-time premium of $10 per ounce on gold or to arbitrarily fix its permanent price at $30 per ounce.

The tungsten market has received serious discussion in this State. The recent visit to Denver of the Federal Tariff Commission brought out many vital points relative to the future of tungsten mining in Colorado. The opinion prevailed generally among operators of these mines and reduction works that Congress should promptly fix an arbitrary price or an import duty, or should devise some other scheme whereby tungsten products could be always saleable at approximately $35 per unit.

One mineral that is actually bringing one of our old and formerly prosperous districts back into notice is totally different from the one that was first mined. A trip to this former gold-producer—Jamestown—impresses one with the importance of mining fluorspar, the latest mineral. The road between 'Jimtown' and Boulder is lined with auto-trucks that, two or three years ago, ran over the road between Nederland and Boulder with tungsten ore. Most of the fluorspar from the district is purchased by one Boulder company that operates a concentrating mill, in which the ore is raised in grade from 82 to 98% CaF_2, after which it is shipped to mid-West and Eastern consumers. Fluorite is being mined also at Evergreen in Jefferson county. Prices



THE SMUGGLER-UNION MINE, TELLURIDE, COLORADO

at the mines average around $6 per ton for 70% ore, with 20c. per unit above or below this. It is reported that a new company is about to take over the Wano gold mill at Jamestown, and purchase custom fluorspar ore upon a schedule starting with $3 per ton for 50% grade, and an additional 20c. per unit above. This is substantially better than the present schedule, and indicates a strong tone in the fluorspar market. The fluorspar at Jamestown occurs

in veins, with various strikes and dips, in a great mass of porphyry.

Despite rising expenses in mining, there is an unmistakable interest in silver. Reliable reports of renewed activities come from Silver Cliff, Creede, Silverton, Ouray, Crismas, Caribou, and Ward. In these districts, abandoned mines have been or are being re-opened. The Bassick, at Silver Cliff, is to be equipped with a 100-ton flotation plant. This mine has long been a geological curiosity, the ore occurring as cementing material for gravel in an extinct vent or geyser. In addition to renewed production from the Equity mine, Creede is expecting big things from the Monon group, an old property that was about to enter the shipping list when the general depression of the 'nineties struck the district. Officers of the Monon Mining Co. are: George C. Manley, president; August Drumm, vice-president; Theodore H. Thomas, secretary-treasurer; and Thornton H. Thomas, attorney; these last two men being known in Colorado as the 'Thomas twins.' From the Silverton district comes news that the old Peerless San Juan mine, in Minnie gulch, is being revived, after years of legal entanglement, by the Caledonian Mining & Milling Co. New machinery will be erected in the mill that was operated for a brief run years ago. Boulder county, too, is enthused about silver mining. H. F. Corfield, in developing the Congo Chief at Caribou, has exposed an 18-in. shoot of ore assaying from 250 to 400 oz. in silver. Alongside of this shoot is a 2-in. streak of argentite assaying up to 3290 oz. silver per ton, the metal associated with galena. The White Raven mine near Ward continues to produce high-grade silver ore from the curious stockwerk whose genesis has never been satisfactorily explained. At Crisman, the Yellow Pine has passed into the management of J. W. Pherson of Cripple Creek. He proposes to introduce more intensive mining among the 18 sets of lessees. This mine, for which its original owner once refused a million dollars, has been a small but consistent shipper since its location in the 'seventies, and we expect to hear of even better production.

The writer was agreeably surprised, during a recent trip, to see that the old Golden Age mine, at Springdale, Boulder county, is being worked. In this property there exists a system of parallel fissures traversing a mountain of mineralized porphyry. Operations ceased at this mine when the buildings were burned in 1897. In general, the ore is a low-grade gold-bearing sulphide, and is being concentrated in the old Standard mill at the foot of the mountain along James creek.

More interest is maintained in oil-shale, probably, than in any other new branch of Colorado mining. This is said advisedly. Showings in the field do not indicate any special progress, but the fact remains that actual construction of plants is withheld simply pending the selection of processes and equipment that will be reasonably sure of accomplishing success upon a commercial scale. This is a new industry for Americans. There are no operating oil-shale plants in this country from which to compile data as to treatment and costs. It is understood that at least one strongly-financed company proposes to put in a modified Scotch system in the DeBeque field, but the majority of operators appear to doubt the adaptability of foreign systems to our Western shales. Numerous American ideas are being developed, their progress being carefully watched.

CRIPPLE CREEK, COLORADO

Gold Output and Dividends.—Ore-Treatment Charges.

Production of the district in June was as under:

Where treated	Tons	Average value
Golden Cycle, Colorado Springs	30,400	$20.00
Smelters, Denver and Pueblo	2,500	55.00
Portland, Independence	36,350	2.46
Portland, Victor	13,880	2.15
Vindicator, Cripple Creek	19,800	2.10

The total was 102,930 tons, valued at $1,006,343. Dividends were paid by the Cresson, $122,000, and Golden Cycle, $45,000.

The Portland company has announced the following rates for treatment of ore at its Independence mill, effective July 1:

Value per ton	Charge per ton
Up to $3	$2.00
$3 to $3.50	2.25
$3.50 to $4.00	2.50
$4.00 to $4.50	2.60
$4.50 to $5.00	2.75
Freight on above grades	0.60
$5 to $8	$2.00 to 5.00
Freight on above grade	0.90

The Golden Cycle company announces the following new schedule for treatment at its plant at Colorado Springs:

New rate per ton	Old rate per ton	New rate per ton	Old rate per ton
$3.25	$3.00	$6.90	$6.50
4.25	4.00	7.50	7.00
5.25	5.00	8.60	8.00
6.60	6.00		

The Roosevelt drainage-tunnel was extended 79 ft. during June. The flow is now 3480 gal. per minute.

Armed guards accompanied two box-cars of ore from the Cresson mine to the Golden Cycle mill on July 2.

PLATTEVILLE, WISCONSIN

Review of Important Events in the Zinc Districts.

Highland.—The New Jersey Zinc Co. is operating the two Clark mines successfully. Wages were increased generally at the beginning of the month 25c. per day.——A new mine was developed on the Hying farm, one mile west of Clark No. 2. Drills were working on land adjoining.——The Saxe-Lampe Co. reduced its working force from 25 to 7 men, and kept going to keep its mine dry and raise a little ore. Six mines with mills however were idle in the first half of June.

Montfort.—Local mining interests started seven drilling squads prospecting for pyrite one mile west, where large deposits are known to exist.

Linden.—Indianapolis mining men purchased the Spring-Hill mine and mill for $6500. Operations were resumed, a shaft being sunk to ore. New ore was found last autumn by drilling.——The Lucky-Six No. 2 of Milwaukee started the Vial mine on the first of the month. It was recently equipped with a 150-ton mill.

Mineral Point.—The Mineral Point Zinc Oxide Works is working full time. Sales of the product have been light this season, and the warehouse capable of housing 50,000 bbl. is overflowing, so additional storage capacity has been provided. Sulphuric acid shipments are made from the acid plant daily. The two zinc-ore separators operated here on crude zinc concentrate turn out from 600 to 800 tons of high-grade blende weekly.

Mifflin.—The Vinegar Hill Zinc Co., operating two producers, the Yewdall and Senator mines, is engaged in a large exploratory program. A new mine has been developed on the Franklin Rundell farm. Ore is to be trammed to the main mill on the Yewdall. On the Dale Rundell farm another big deposit of zinc has been opened, and a new zinc concentrator is being erected. On the Albert Rundell farm, the same 'range' extending across country has been traced by drills, so the prospect of an additional producer is good.——Other good producers here are the Coker and Big Tom mines.

Platteville.—This district is practically shut-down, no shipments of ore coming from the Block-House, New Rose, or Mann & Harding mines. At the first named there was held on June 15 about 4000 tons of concentrate and separator product.

Cuba City.—The usual heavy receipts of raw ore at the

National Separators from Vinegar Hill mines has dwindled considerably, dropping from 20 to 8 cars weekly.——The Linden Zinc Co., another ore-separating concern, was being supplied with raw ore from the Frontier mines. Shipments of high-grade finished ore fell to about 60% of normal.——The Connecting Link Mining Co. completed a new mill and started it about the middle of June.

Benton.—This district is the one bright spot in the region, the output and deliveries being over 2000 tons of concentrate weekly. No mine development was reported; mine equipment and building was brought to a standstill. Prospecting with drills continued at a brisk pace, nevertheless.

Shullsburg.—Three fairly good zinc mines operated steadily here and shipments are regular.

Hazel Green.—The only producer to continue shipments from this district is the Kennedy mine, completing 25 years of active work.——The newly-equipped Jefferson mine was unable to get onto a producing basis on account of a heavy overflow.——The Monmouth Mining Co., shut-down a year ago, resumed operations.

DILLON, MONTANA

Mining and Placers in Madison County.

Dillon.—The old Pilares mine, about 40 miles west of here, is again being worked, employing 35 men. Several years ago, H. Armstead spent between $300,000 and $400,000 erecting a smelter, etc., but production was practically nothing.

A. H. French is leasing and shipping some lead-silver ore from the Argenta, 11 miles west of Dillon. A few other lessees are working.

Smith and partners are working a graphite mine, 15 miles south-east of Dillon, shipping a car per month of high-grade ore, which goes to Bethlehem, Pennsylvania.

The Beaverhead Oil Co. is drilling out from Dillon about nine miles south-west. The shales are said to be favorable.

Some work is being done on a new manganese property, 10 miles north-east of Dillon, at the 'Hogback.'

Bannack.—The two mines here are practically idle. A large mill was erected last year and much work done, but something went wrong.

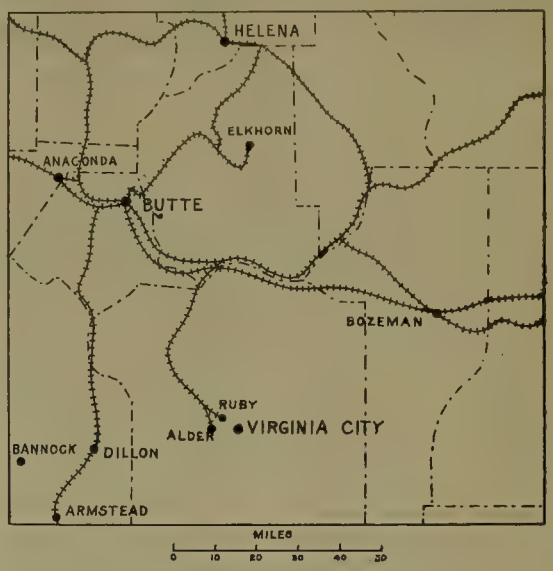
A lessee at the Delmonte lead-silver mine, near Bannack, recently shipped a car of ore.

Virginia City.—The Conrey Placer Mining Co.'s operations at Ruby, and above on Alder gulch for five miles, are about finished. There is 18 acres on the north side, just above Ruby, yet to dredge; this is about all. Bedrock is low; they are now filling the pit to float and operate a dredge. The ground at the upper end has reached the area where it was all drift-mined years ago. Alder gulch, where dredged, seems to be from 100 to 200 yards wide. Above the last dredge it has been placer-mined for seven miles. The dredges are driven by electric power. Their costs have been just under six cents per cubic yard, and the average value of the ground at the lower end, four to eight miles down, has been 16c. per yard, according to Government report (U. S. Bureau of Mines Bulletin, abstracted in the 'Press' of September 23, 1916). Operations have been very profitable. The round boulders are not large and are easily handled. They appear to be much less worn at the upper end of the dredging area than lower down. This does not indicate a glacial deposit as its origin (as sometimes claimed), nor is there any other placer ground found of any account, outside of this small, narrow, long gulch. The country rock is largely gneiss with limestone and some porphyry.

It is claimed that the records of Wells, Fargo & Co. show that $105,000,000 worth of placer gold was shipped out of Alder gulch by them in the early days.

The Eastern Pacific, up toward the head and west of Alder, has had a large production (largely silver) for 25 years. The owners are now cyaniding the tailing. The Highup, nearby, is said to make a good showing, now under option to Salt Lake City people.

The Missouri, a few miles east and north of Virginia City, has been shipping high-grade gold-silver ore for years. It now has a mill about ready to start. It is owned by Ellings & Pankey. From the numerous known veins it would appear that the old district of Virginia City should 'come back.' It is pretty country, well watered, and with a railroad five or six miles below Virginia City (the county-seat of Madison county), a branch of the Northern Pacific from Whitehall.



MINING DISTRICTS IN MADISON AND BEAVERHEAD COUNTY DISTRICTS, MONTANA

VICTORIA, BRITISH COLUMBIA

Rare Minerals Included in the Mineral Act.

The Mineral Act of British Columbia has been enlarged by Order-in-Council to apply to tungsten, fluorine, vanadium, radium, and uranium, or any combination of these elements "with themselves, or with any other elements." This action was taken by the Provincial government on recommendation of the Hon. William Sloan, Minister of Mines. It having been brought to the attention of the Provincial Department of Mines that there are occurrences of fluorspar and of scheelite here, it was decided to lose no time in bringing these and other minerals, heretofore outside the scope of the Act, within its provisions. It may be stated by way of explanation that the Provincial Mineral Act, and its definition of mineral, was drafted 20 years ago when the minerals in question were unconsidered, so that they have been in the anomalous position of being unstakable under the Act in a legal sense, although common sense and the necessities of the times demanded their inclusion. Incidentally it is pointed ou that the British War Board has asked the Canadian government to produce as much vanadium as possible, while the need of tungsten is also great. Not an inconsiderable market for fluorspar exists at the smelter of the Consolidated Mining & Smelting Co. at Trail.

Grand Forks.—The Consolidated Mining & Smelting Co. is said to have acquired under bond a large fluorspar deposit situated 20 miles north of this place.

ALASKA

Cordova.—The Chilty Oil Co., operating in the Katalla field, brought in a good well on July 5.

ARIZONA

Jerome.—On June 28 a committee, said to represent the Central Labor Union of Jerome, presented a demand to the Verde District Mine Operators Association for an increase in wages amounting to an average of over $1 per day each for all mechanics and laborers employed in and about the various properties and plants in the district. However, the demand was for an increase of only 10c. per day for shovelers. The committee intimated that if such increases were not forthcoming by July 1 there would be a general walk-out of all employees. The demand was refused by the Operators Association in a formal reply, and the Secretary of Labor, Wilson, was informed by wire as to the nature of the demand and the refusal, and requested to send at once a Federal Mediator to the district to adjust matters. From all reports it would appear that the movement has been put over by three or four of the extreme radicals here, and, although the rest of the men may be timid of continuing work in case a walk-out is called, the sentiment for the most part seems to be in favor of being loyal at this time, and stand by the agreement to abide by the decision of the Federal representative.

Miami.—On August 15 the Miami Copper Co. pays $1 per share. This makes $3.50 for the current year.

Oatman.—The United Eastern produced 9000 tons of $26 ore during June, yielding a profit of $165,000. This is the largest output since the mine started operations. On July 26 the company pays 5c. per share.

Walker.—The Lacey-Pabst company, former operator of the Union mine at Chaparral, has transferred its men to the Mud Hole gold mine at Walker. The first work will be to re-timber an old 80-ft. shaft where gold-silver ore was found; also the removal of an electric hoist from other workings to this shaft. W. J. Casey is in charge. The Mud Hole has produced more than $325,000 from shallow workings previous to the I. W. W. strike 10 years ago.

Silver-sulphide ore assaying over 200 oz. silver and $48 gold was opened in a 30-ft. shaft by W. McLeod last week. The vein is 4 ft. wide and the high-grade streak 8 to 12 inches.

Development has been gratifying at the old Milliken mine on Spruce mountain, one mile from Walker. An old tunnel opened shows 125 ft. on a vein assaying from $8 to $48 in gold and silver. A new shaft is being sunk and shows rich ore.

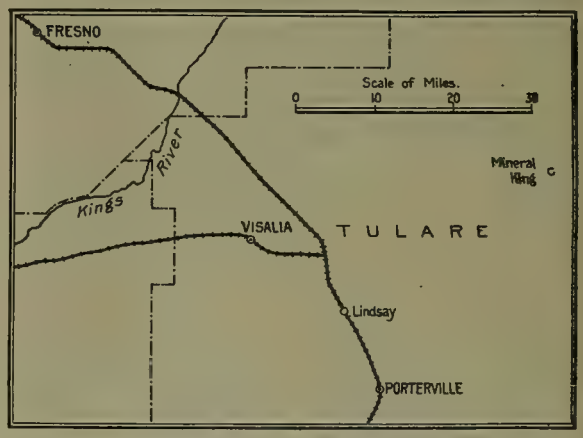
The molybdenum property owned by J. T. Burris and others is exceptional. The pay-streak is 18 to 30 in. wide, and assays by H. E. Woods & Co. of Denver show 3.6 and 4.9%. The No. 2 prospect is opened by a 125-ft. tunnel cutting the vein at 45-ft. depth, also by a 50-ft. winze in ore all the way. Some bunches show almost pure metal. The molybdenite is well disseminated and not in seams.

Placer mining along Lynx creek by C. H. McDonald has been suspended because of inadequate water supply. He will devote his attention to some lode claims. The clean-up was satisfactory. A number of $3 to $6 nuggets and much fine gold and amalgam are being saved. Lnyx creek, according to Government statistics, has produced over $5,000,000 in gold. When water is available it is not an uncommon sight to see citizens and even school-children digging and panning.

The Black Diamond mine operated by Irving is now producing. Veins of gold-lead-silver ore, 24 to 36 in. wide, worth $55 per ton, have been opened on the 100 and 200-ft. levels, with drifts 50 ft. each way. Sinking is under way to 300 ft. The property is equipped with 35-hp. hoist, steam-boiler, pump, and shops. There is 75 tons of ore ready for the next shipment.

CALIFORNIA

Porterville.—Magnesite mining in this district is still at a low ebb, and likely to continue so. A large deposit of feldspar was found recently on the Entriken property, 18 miles east of here. The orebody is on a steep hillside, and



PART OF CALIFORNIA, SHOWING SITUATION OF PORTERVILLE

is hauled on sleds to the bottom of the hill, then taken to the Globe station on the P. & N. E. line.

Sacramento.—In the dispute between William Hales and the Central Pacific Railway Co., defendants, and the Power Timber Co., assignee, the Land Office here has decided that miners may file mineral claims to railroad lands in California found to contain chrome. The decision has been sustained by the Federal Commission.

San Francisco.—Method of planning oilfield development is to be the subject of discussion at a public meeting called by the State Mining Bureau at the Engineers Club, 57 Post street, on July 15, at 2 p.m. This is the second of a series of meetings arranged by the State Mineralogist, Fletcher Hamilton. The first, held at Los Angeles for the purpose of discussing drilling methods involving the use of mud fluid, was well attended.

Yreka.—Hugh McKinnie, of the Ora Grande Mining Co., associated with local people, announces that they will open chrome sampling works and an assay-office at Yreka, to buy

and ship ore for the outside market. It is estimated that there is a large quantity of available chrome ore within 50 miles from the shipping point.

COLORADO

Breckenridge.—To test an ore carrying lead, zinc, gold, silver, and bismuth, owners of the Royal Tiger mine (J. A. Traylor, principally interested), have erected an experimental plant.

Durango.—One of the most interesting mining operations in south-western Colorado is that of the Cumberland Mines Co., leased from W. B. Ritter by R. R. Selway and W. Goff Black. The syndicate has strong backing. C. B. Miller is in charge. A shaft is being sunk on the vein to the Carboniferous area, which at the Cumberland is only 300 ft. from the porphyry. As there is no part of the district that is in the Carboniferous formation in which the Rico ore is found, this is attracting the interest of geologists acquainted with the La Plata mountains. The Cumberland has two strong veins carrying rich ore. Both have been slightly worked in previous years, and indications are favorable.

Leadville.—Manganese producers here are not satisfied with the new prices for their product, especially on ore carrying less than 35% Mn, as brokers make low offers for this. There are few mines here that yield ore of better grade.

The Leadville Unit of the U. S. S. R. & E. Co., after 30 months work in charge of H. S. Lee, has decided that Fryer hill does not justify further expenditure in development and pumping. Large sums have been spent at the Harvard, Jamie Lee, and Tip Top shafts. Results were discouraging. About 75 men were employed. The plants are to be dismantled.

GEORGIA

Chestatee.—The Chestatee Pyrites & Chemical Corporation has completed the construction of its 10-mile standard-gauge railroad to Clermont, Georgia, and its 600-ton sorting and concentrating plant. Underground development has shown an important deposit of iron pyrite. Production will start some time in July. The company has its own hydro-electric power-plant and a large townsite with comfortable houses for employees.

IDAHO

Bonners Ferry.—The Deer Creek Mining Co.'s gold property in the Buckhorn district of Boundary county has been sold to Montana people for $30,000. Conrad brothers, bankers of Montana, are interested.

Gilmore.—The Pittsburg-Idaho, Gilmore, and Latest Out companies are employing 50, 15, and 40 men, respectively. All three are shipping ore to smelters in Utah, and are reported to be in good condition.

Kellogg.—The Constitution M. & M. Co. on Pine Creek is to resume work now that the O.-W. R. & N. Co. is to complete the railroad. The mill is to be re-modeled and enlarged to 200 tons capacity.

Mackay.—On July 1 the Empire Mines Co. paid 5c. per share, equal to $50,000. This makes $100,000 for 1918, and $500,000 to date.

KANSAS

Treece.—A mile west of this place the Redskin Mining Co. is to erect a 300-ton gas-engine driven mill. Rich ore has been opened at about 50-ft. depth. F. R. Bouldin is general manager.

MICHIGAN

Houghton.—At No. 20 level the Ahmeek shaft is in a badly-crushed ground, entailing heavy timbering. The present depth is 2799 ft. A good deal of mass copper is coming from No. 2 shaft.

At the Quincy mill, concentrate bins have been enlarged and a foundation has been put in for No. 4 stamp.

MISSOURI

Belton.—Oil and gas possibilities in the Belton area, in Cass and Jackson counties, are discussed by M. E. Wilson in a recent bulletin of the Missouri Bureau of Geology and Mines. The region lies in a direct line of strike, northeast from the shallow pools of Kansas, and no doubt careful mapping will show similar structures along the strike line. A number of small oil and gas wells have been drilled. Possible variable sand conditions, and the presence of faulting and intense folding over part of the area inject an element of uncertainty as to results.

Joplin.—Mines in this district were closed from July 3 to 8 in order that the large reserves of concentrate might be reduced, also that miners could go to their farms for a few days.

MONTANA

Butte.—Davis-Daly made a profit of $59,973 in May. This was from ore mined in the Colorado. The flow of water in the Hibernia is easing considerably.

The Anaconda company has raised miners' wages 50c. per shift. This equals about $3,000,000 per year additional.

Elkhorn.—The Boston & Montana Development Co. reports as follows for 1917:

Expenditures totaled $443,969, including $217,528 for development and equipment, and $213,315 for railroad construction. Cash assets amount to $117,199, and accounts payable $44,079. To bring the property to the productive stage it is proposed to increase the capital from 3,000,000 to 5,000,000 shares, $5 par.

The general manager, J. D. Pope, reports that mining was confined principally to the 1000-ft. level of the Elkhorn mines. The advance was 3125 ft. This was largely in opening the Idanha vein along its course and the Park vein west of the fault-fissure. The Idanha maintained its average width of 20 ft. Where cut, the Park vein is 61 ft. wide, somewhat affected by the fault. In 300 ft. driven the width was reduced to 30 or 40 ft., assaying $20 per ton in gold and silver. Some rich shoots carried 10 oz. silver, 2% copper, 7% lead, and 50c. gold. Estimates of ore in both veins give between 600,000 and 800,000 tons.

On the railway between Divide, on the Oregon Short Line, to the Elkhorn mines, 35 miles, 90% of the grading has been done, 75% of the ties cut, and equipment purchased. The gauge is 36 in., and the line can handle 2000 tons daily. No work was done on the 500-ton mill, pending completion of the line, but foundations and buildings will be constructed before the road is complete to bring in machinery. Although the company can develop hydro-electric power, on account of difficulty in securing plant it has been decided to construct a transmission-line from the Montana Power Co.'s plant on the Big Hole river, 31 miles away.

NEVADA

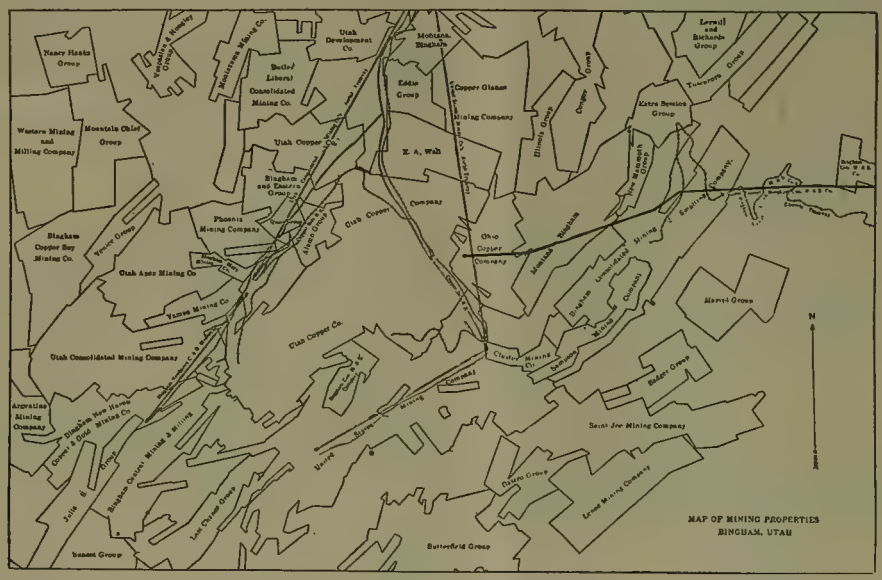
Ely.—The old Silver Eagle mine has been purchased by W. S. Bennett and others of Cody, Wyoming, while the Taylor mine has been taken under option by the same interests. Both properties are lead-silver producers, and are 16 miles south of Ely. Ore worth $1,000,000 is estimated to be available.

Goldfield.—The strike here may be settled by the contract-bonus system being started by the Goldfield Consolidated.

Manhattan.—A consolidation between the White Caps and Manhattan Consolidated is being negotiated. Developments in both mines are said to be very satisfactory. The White Caps mill is working regularly. A new Gould triplex pump has been installed on the 400-ft. level of the Consolidated.

Tonopah.—The Belmont company states that at the end of May the net income for the quarter was $186,553. Available resources were $294,002 from smelters, $156,286 from others, and $233,943 cash in banks. Disbursements in respect of subsidiaries to May 31 were $1,296,872 to the Belmont Surf Inlet, B. C.; $396,896 to the Belmont Shawmut, California; and $331,203 to the Belmont Wagner, Colorado; a total of $2,024,971.

The Tonopah Divide, at Gold Mountain, has sunk its shaft to 350 ft. Fifty tons of ore has been sent to the Goldfield Consolidated mill at Goldfield. It is said that the ore contains molybdenum.



UTAH

Alta.—The railroad into this district is now in good order and many mines are shipping ore to smelters. The South Hecla is sending out up to 125 tons per day. The Michigan-Utah is averaging a carload daily.

Bingham.—The Bingham Amalgamated is to resume work on the Lark side of its property.

From the 'Boston News Bureau' is abstracted the following: The never-ending question of apex rights has again turned attention to the Bingham district, between the Utah Apex and Utah Consolidated. On the side-lines sits the Utah Metals & Tunnel Co. awaiting a decision between the two that it, too, may enter a claim. Utah Apex last summer discovered the largest ore deposit that had ever been found in its property. This was between the 1500 and 1800-ft. levels and was rich in lead and precious metals. It is said that from this orebody Utah Apex has added substantially to its surplus cash that on January 1 last totaled $1,200,000. Since the first of 1918 the company is understood to have been earning net profits of from $75,000 to $100,000 per month, most of which was taken from this newly discovered vein. Now comes the Utah Consolidated, which has entered suit against the Yampa Copper Co., claiming it has been mining on the lime-bed of the Utah Consolidated, and sets forth that the Utah Apex's newly discovered ore is but a continuation of the Yampa lime-bed, and as that orebody apexes in Utah Consolidated ground, Utah Apex is liable for having mined there. Several conferences have been held between Utah Apex and Utah Consolidated, but as yet no definite step has been taken to bring the matter before the Court. Another large deposit of ore was developed last year by Utah Metal & Tunnel Co. in a lime-bed which is in dispute between the Utah Consolidated and itself. This is the orebody that is spoken of in the annual report of the latter company as one of the title of which is "expected to be settled amicably." The discovery of the large body of ore in dispute between these two companies was made last fall when the Utah Metal, after following down a lime-bed in its property for over 1400 ft., came upon a large orebody and discovered that its neighbor, the Utah Consolidated, was raising from below in the same bed. The workings of the two companies here came together and the respective managers have arranged to have the underground conditions examined by engineers whose reports are to be submitted by agreement to the officials of the companies.

Utah Consolidated pays 50c. per share on July 17. This makes $1 for 1918.

CANADA

British Columbia

The five leading mining companies of British Columbia have declared dividends for the first half of the year 1918 as follows:

Granby Consolidated Mining & Smelting Co	$749,924
Consolidated Mining & Smelting Co	523,872
Howe South Co. (Britannia mine)	198,415
Hedley Gold Mining Co	96,000
Crow's Nest Pass Coal Co	62,126
Total	$1,610,337

The Howe Sound Co. leads in the ratio of dividend to capitalization, its rate being 5% per quarter or 20% per annum. Granby leads as the largest dividend payer in the Province, its total to date aggregating $10,198,895. Both Granby and the Consolidated M. & S. Co. pay dividends at the rate of 10% per annum.

MEXICO

Chihuahua

Juarèz.—Epifanio Holguin, the Villa leader who has been robbing trains and looting ranches in northern Chihuahua, has ordered the Erupcion Mining Co., an American company operating mines 85 miles south of here, to stop all operations, according to the owners of the mine, who reached Juarez recently. Freight wagons, lumber, and other materials at the mine have been burned, and the workmen warned not to approach the property. The reason given for the order was the refusal of the company to pay Holguin a ransom. Miguel Holguin, brother of the Villa leader, has accepted amnesty and has joined the Federal

forces at Chihuahua City, having appeared at Villa Ahumada and surrendered.

Hidalgo

Pachuca.—The U. S. S. R. & M. Co., operating the Real del Monte mines and mills, reports for the first half of 1918 that an average of 56,500 tons of ore has been treated monthly, an increase of 1900 tons compared with the second period of 1917. Silver realized 93c. per oz. for the current year.

Jalisco

Etzatlan.—The Amparo Mining Co. has issued its report for 1917. During the first half, capacity was at 50%. For the first seven months there was a shortage of cyanide. Supplies advanced in price from 50 to 300%. Considerable development was done, and repairs made. Flotation was tried, but, although encouraging, cyanidation will be continued. The year's receipts totaled $1,220,964, including $1,052,239 from bullion and concentrate, and $138,302 profit on silver certificates sold. The operating profit was $195,565, less Philadelphia expenses and taxes, leaving $178,065 net. Dividends amounted to $320,000. The surplus of $1,581,139 at the beginning of the year was reduced to $1,269,037 at the end. Current assets total $1,293,455, and liabilities $517,850.

The general manager, J. H. Howard, states that although bandits took the town of Etzatlan, operations were little disturbed from this source. Military protection and watchmen cost $38,199. Development amounted to 1616 metres in ore and 1110 metres not in ore. A large stope was opened at 1000 ft. depth, but little has been exposed at 1300 ft. Reserves, according to the engineer, W. R. Askew, total 481,572 tons, of which 341,622 tons is positive.

The mill worked 67.7% of possible time, treating 84,277 metric tons of ore, a decrease of 14,763 tons compared with 1916. The average assay was 7.93 grammes gold and 326 grammes silver per ton, an increase of 8 of silver, but a decrease of 2 of gold. The theoretical extraction was 87.84%, a drop of 3.26%. Costs are given in considerable detail; they were as follows: mining, $2.58; development, 85c.; crushing and tramway, 25c; treatment, $3.73; selling expenses, 67c.; general charges, $1.23; taxes, $1.15; premium, 12c.; miscellaneous, 9c.; a total of $10.79 per ton.

Total bullion extracted was 24,250 kilogrammes of silver and 608 kilogrammes of gold, equal to 776,000 oz. and 19,456 oz., respectively.

Mexico

El Oro.—The Esperanza Mining Co. has issued its report for 1917. Bullion and concentrate production, etc., was valued at ₱1,822,895. Mine operations and taxes cost ₱1,435,436. The profit was ₱121,965. Dividends amounted to ₱112,500. Current assets total ₱1,074,458, and liabilities ₱61,359. The political conditions in Mexico were satisfactory, but the economic conditions did not improve. The mill treated 181,935 metric tons of ore, filling, and dumps, a gain of 68,014 tons. Development totaled 9908 ft. Diamond-drilling at El Sirio was not encouraging. A re-estimate of ore-reserves showed 65,368 tons, with a recoverable value of ₱1,400,000, and profit of ₱400,000. This does not include old filling. At present the tailing dump is not profitable to treat.

Sonora

Nacozari.—The Progreso Silver Co. is constructing a 100-ton all-sliming cyanide mill to treat ore from the Progreso-Colorada silver-gold mine on the east side of the Moctezuma river, 100 miles south of Nacozari. This mine has shipped $1,000,000 of high-grade silver ore at different times since 1898 to the Douglas and El Paso smelters. Dumps and reserves in the mine total 40,000 tons, available for the new mill. Five parallel veins are worked. The ore is highly silicious, carrying 25 oz. of silver and 0.2 oz. gold per ton.

PERSONAL

Note: The Editor invites members of the profession to send particulars of their work and appointments. This information is interesting to our readers.

Paul Couldrey is in active service in France.

Kirby Thomas has returned to New York from Arizona.

F. C. Brown has returned to Boise, Idaho, from a trip to Nevada.

W. B. McPhee, recently at Como, Nevada, is now in San Francisco.

Ben. B. Lawrence is returning to New York from Cornucopia, Oregon.

F. D. Adams, professor of geology in McGill University, has gone to London.

William W. Mein was in San Francisco this week-end, on his way to Los Angeles.

E. B. Thornhill, of the General Engineering Co., has moved from Ottawa to New York.

William Loeb Jr., C. K. Lipman, and **F. R. Foraker**, of the A. S. & R. Co., were here this week.

Ernest J. Stanley has been appointed chief engineer for the El Tigre Mining Co., Sonora, Mexico.

F. W. McNear, president of the Michigan College of Mines, is doing Government work at Washington.

A. D. Cox has gone to Dome, Yuma county, Arizona, to take charge of an old lead-silver mine for the Reorganized United Mines Company.

Rensselaer H. Toll is investigating chrome production in Fresno and neighboring counties under **Albert Burch**, for the U. S. Bureau of Mines.

M. M. Summerhayes, formerly manager for the Porcupine Crown Mines, is now manager for the Bluestone Mining & Smelting Co. at Mason, Nevada.

P. R. Bradley, of the Alaska Juneau and Treadwell mines, has been appointed Food Administrator of Alaska to succeed the late Judge **R. A. Gunnison.**

O. McCraney, mine superintendent for the White Caps Co., Manhattan, Nevada, has accepted a similar position at the Eagle Shawmut mine, California. **W. L. Taylor** succeeds Mr. McCraney.

M. J. Murphy succeeds **W. L. Cole** as superintendent for the Mountain Copper Co., Kennett, California. Mr. Cole retires on September 1 after 23 years service. **E. L. Stenger** has been appointed assistant superintendent.

H. R. Robbins has severed his connection with the Granby Consolidated M. S. & P. Co., Ltd., for the duration of the War, and has been commissioned Captain, National Army, assigned to special duty with the General Staff.

Obituary

William Johns, foreman of the Camp Bird, died at Ouray, Colorado, on July 2.

Angus Mackay, manager of the Vulture mine, in Yavapai county, Arizona, died suddenly at Oakland on June 29. He was the son of the late Senator Mackay of Montreal and graduated at McGill University.

The Mining Society of Nova Scotia held its 26th annual meeting at Sydney on May 1 and 2. There were sixty present, the retiring president, **D. H. McDougall**, being in the chair. The new officers are: **Thomas Cantley**, president; **A. J. Tange** and **G. D. McDougall**, vice-presidents; and **E. C. Hanrahan**, secretary-treasurer. Four interesting papers were read, generally dealing with coal-mining problems.

THE METAL MARKET

METAL PRICES

San Francisco, July 9

Aluminum-dust, large and small lots, cents per lb.	65—70
Antimony (wholesale), cents per pound.	15
Copper, electrolytic, cents per pound, in carload lots.	26.00
Copper, electrolytic, cents per pound, in small quantities.	27.30
Lead, pig, cents per pound.	8.30— 9.30
Platinum, Government price, per ounce.	$105
Quicksilver, per flask of 75 lb.	$120
Spelter, cents per pound.	11
Zinc-dust, cents per pound.	17½

ORE PRICES

July 9

Antimony, 45% metal, f.o.b. California, per unit.	$1.10
Chrome, 38 to 48%, California, per unit.	$1.25—$1.50
Magnesite, crude, California, per ton (nominal price).	$7.00—$8.00
Manganese, domestic, 35 to 54%, f.o.b. South Chicago, per unit (Government price, effective May 29).	$0.86—$1.30
Manganese, domestic, 35 to 54%, f.o.b. east of South Chicago, per unit (Government price, effective May 29).	$1.01—$1.45
(Manganese, domestic, penalty of 50c. to $1 per ton for 8% and up to 25% silica, and bonus of 50c. to $1 for less than 8 and 5%.)	
Molybdenite, per lb., 90% MoS_2.	$1.25
Pyrite, per unit of sulphur, cents.	28
Tungsten, 60% WO_3, California, per unit.	$24

Tungsten prices, as quoted by this and other mining journals, have been declared as being too high; but we learn that large sales have been made at $25 per unit, disproving such assertions.

EASTERN METAL MARKET

(By wire from New York)

July 9.—Government price for copper advanced to 26c. on July 2. Lead is quiet, though strong. Spelter is easier, but firm.

SILVER

Below are given official (not Government) quotations, in cents per ounce of silver 999 fine. In order to make prompt settlements with smelters and brokers, producers allow a discount from the Government price of $1, hence the lower price. The Government has not fixed the general market price at $1, but will pay this price (as from April 23, 1918) for all silver purchased by it. The equivalent of dollar silver (1000 fine) in British currency is 46.65 pence per ounce (925 fine), calculated at the current rate of exchange.

Advice from Samuel Montagu & Co. of London, dated June 13, says that the tone of the silver market continues good, especially now that Shanghai exchange has risen to a point closely approximating that at which silver purchases for China might become profitable. The scarcity of silver in Europe is suggested by a report that current silver coin is being melted down in Holland in order to provide material for industrial purposes. In normal times such an operation could not have been profitable in Holland, unless the local quotation for silver had exceeded the parity of 60¼d. per oz. There is a reduction of 91 lacs ($2,730,000) in the silver holding of the Indian Treasury, but the amount of silver on the way from the United States is considerably less, and the total within India has increased by a couple of crores ($32,000,000). The stock in Shanghai on June 1 consisted of 29,500,000 oz. in bars and 15,300,000 Mexican dollars, compared with 31,300,000 oz. and 15,900,000 dollars on May 25.

LEAD

Lead is quoted in cents per pound, New York delivery. Government metal receives 7c. per lb. until August 6. Early in July producers agreed to fix prices at 7.90c. per lb., New York.

COPPER

On September 21, 1917, the Government fixed copper prices at 23.50c. per lb. for large lots, and 24.67½c. for small lots, effective until June 1, 1918. On this date the prices were re-fixed until August 15; but on July 2 the price was increased to 26c. and 27.30c., respectively, until August 15. Quotations in cents per pound are as under:

Additional to the above heading on the increased price for copper, the small or high-cost producers are to be considered by the War Industries Board on August 6.

Secondary copper produced in the United States in 1917 totaled 383,400 short tons, all from scrap.

ZINC

Zinc is quoted as spelter, standard Western brands, New York delivery, in cents per pound. On May 25, 1918, the Government fixed prices until September for grade A spelter at 12c. per lb. for itself and the open market. Lower grades can make their own prices as usual. Sheet-zinc is fixed at 15c., and plate at 14c. per pound.

QUICKSILVER

The primary market for quicksilver is San Francisco, California being the largest producer. The price is fixed in the open market, according to quantity. The Government is taking 40% of the United States quicksilver output, paying therefor $105 per flask. Outside of this business the competitive market can make any price as usual. Prices, in dollars per flask of 75 pounds:

ORES (New York)

Antimony: No transactions or developments are heard of in this market.

Ferro-manganese: Imports in May are officially reported as 4138 tons, with the prospects that the June figures will show at least 5000 tons. Electrolytic 80% ferro from Japan has appeared in this market.

Manganese: The market seems to be easier. Offerings of Indian high-grade ore have brought bids of $1.38 per unit, compared with a former recent price of $1.45. Brazilian ore is also said to be available at $1.05 per unit, seaboard, but this is hardly credited.

Molybdenum: A report is to the effect that a small lot has been sold at $1.25 per pound.

Tungsten: A fair business for the last week is reported done at the unchanged prices of $20 to $24 per unit. Ferro-tungsten seems strong at $2.40 per pound of contained tungsten.

Eastern Metal Market

New York, July 3.

The markets are all strong but none are particularly active. Price changes have been of little consequence except in zinc.

A change in the copper price has been made, a result of yesterday's unexpected meeting in Washington, the price being advanced to 26c. per pound.

Tin is extremely quiet with practically no business because of lack of offerings.

Lead is quiet but strong at agreed maximum prices.

Zinc is moderately active, but strong and higher.

Antimony is quiet and unchanged.

In the steel trade striking news is not abundant. An important item is the fact that the steel manufacturers' committee is in conference in Washington this week with a view to fixing prices on rails, wire-rope, and steel and malleable castings. The question of some re-adjustment in pig-iron is also to be discussed. Lake Superior ore producers have decided that the 45c. advance in price noted last week shall apply only in part to 1918 contracts, that is, to ore unloaded at Lake Erie docks after midnight on June 30.

June pig-iron returns by wire to 'The Iron Age', with several furnaces estimated, show a slight falling off as compared with May, the total being 3,323,791 gross tons for 30 days or 110,793 tons per day against 111,175 tons per day in May.

COPPER

An entirely unexpected meeting was held in Washington on Tuesday afternoon, July 2, between the representatives of copper producers and the War Industries Board. The former were summoned to Washington by telegraph. It is understood that this is the August 7 meeting, previously arranged for late in June, advanced to the present time. When in June the price question was settled by a continuation of the present 23.50c. price to August 15, there was much dissatisfaction, and another meeting was later called for August 7. It was believed that there was something in the wind as to a new price and that an advance was to be authorized, to be retroactive to July 1, but no higher price than 25c. was expected, although the conditions justify several cents above that figure. One reason offered for the rise is the increase in freight rates. Believing that a change in price was likely, producers were booking orders only on the condition that they be subject to any new price. It is a fact that there has been no acquiescence by producers in the continuance of the old 23.50c. price after June 1. The announcement of an increase in price to 26c. has shown a disposition to accept the opinions of producers, and this is encouraging. The demand is now larger and it is stated that producers are very much behind in their May deliveries. An interesting rumor is to the effect that a proposition has been made to the Government that it temporarily take over the operations of all small producers having a high cost of output, and who produce 75,000,000 to 100,000,000 lb. per year. Another proposition is that the Government take the output instead of the control and allow a reasonable profit to the small producer. The May output of blister copper is estimated to have been 170,000,000 to 175,000,000 lb. or 10,000,000 to 15,000,000 lb. under estimates.

TIN

Due to a decided lack of offerings the market has been dull and slow again. There has been a dearth of offerings of all kinds, which has for the time put a decided check on transactions. Considerably more interest has been manifested by buyers, but they could not obtain what they have wanted during the last week. According to a large importer there have been no offerings of Straits tin in the week covered by this report. The licenses to ship English Lamb and Flag tin have been temporarily held up. Confirmation of this statement has been unobtainable in this market but one large dealer believes there is something in it because of the dearth of offerings cited above. The price-fixing matter is still in the air, but nothing definite is heard about it. It may come to something and it may not. It is certain that a fixed price is obtainable only by agreement between the American and British governments. Deliveries of tin in June were larger, totaling 6782 tons, of which 998 tons came in at Atlantic ports, and 5784 tons at Pacific ports. Stock and landing on June 30 was 95 tons. The June deliveries compared with a little over 5000 tons in March and April, and 4056 tons in May. The London market is a little higher than a week ago or £332 10s. per ton for spot Straits as compared with £332 per ton a week ago.

LEAD

A concerted and determined effort on the part of lead producers to prevent the market reaching premium prices has resulted in a mutual agreement to fix the price at 7.75c. per lb., St. Louis, or 7.90c., New York. The American Smelting & Refining Co. took this position early last week and it has become general. The object is clear—to avoid a maximum price by the Government. Not very much is being offered, but such as appears is generally going at 7.90c., New York. There is evidently a scarcity, at least supplies are no more than equal to the demand. The re-adjustment of the New York price to 7.90c., as compared with 7.82½c. a week ago, is due to the advance in freight rates. There may be further changes from this same cause.

ZINC

The market has continued to advance during the last week until yesterday prime Western had sold and was quoted at 8.65c., St. Louis, or 8.85c. per lb., New York, for July or early delivery. As high as 8.62½c., St. Louis, or 8.87½c., New York, was noted, with a premium of at least ⅛c. per lb. asked for August-September delivery. One cause of a stronger market has been large buying in the last 10 days of prime Western and grade C by the Government. This is estimated to have amounted in all to at least 10,000 tons. The Navy Department has also bought 1000 tons of grade B and 500 tons of grade C which are reported to have gone at 9.75 and 8.36c. per lb. respectively. The sale price of the prime Western, 9000 tons of which went to the Ordnance Department of the Army, is not publicly known. At present the demand has died down, though a sale of 1000 tons of prime Western is noted as of yesterday. It is believed that the crest of the upward movement has been reached for the present, and that an easier market is likely for a time at least, due to the fact that some producers who did not sell to the Government are probably ready now to sell to others. In fact, one quotation yesterday appeared for 8.50c., St. Louis, or 8.70c., New York, for July delivery. There has been some inquiry from galvanizers.

Sheet zinc is officially fixed at 15c. per lb. base, with plate zinc at 14c. per lb. Grade A zinc has also a maximum price of 12c. per pound.

ANTIMONY

The market is quiet and dull at 13 to 13.25c., duty paid, New York, for prompt and early delivery of Chinese and Japanese grades.

Book Reviews

Powdered Coal as a Fuel. By C. F. Herington. Pp. XI-211, 84 ill., index. D. Van Nostrand Co., New York, 1918. For sale by 'Mining and Scientific Press.' Price, $3.

The use of pulverized coal is expanding with great rapidity. The efficiency obtainable, as compared with coal burned in the ordinary way, is so great that it offers the fuel engineer an opportunity to still further decrease the cost of generating steam, and the smelter an opportunity to largely augment the capacity of his furnaces. When it is realized that steam engineering has advanced to such a point that two years ago, at the costs then prevailing, it was possible to ship bituminous coal as much as 200 to 300 miles from the mines to the Atlantic coast and to burn the run-of-mine under boilers with the aid of automatic stokers, and convert the power developed into electric energy at a cost of about 0.4c. per kilowatt hour at the switchboard, it will be seen that the added efficiency of burning the coal in the pulverized form will long sustain the steam-plant as a competitor with hydro-electric installations. Although powdered coal was employed for burning cement clinker as much as 40 years or more ago, it is probably not an over-statement to say that the development of the art is still in its infancy. This finds substantiation in the fact that the engineers who have written upon it seem to have no exact idea of the character of the new physical conditions that are created when the coal is reduced to a fine state of subdivision, although they recognize that some marvelous change has taken place. Until the nature of a substance is completely comprehended the most intelligent adaptation of it to industrial use is not possible. It is true that the combustibility of coal, that is, its rate of combustion, increases in proportion as the superficial area is extended by fine-grinding. The smaller the particle the greater its specific surface, as every mathematician knows. If this be continued until the smallest particle that can be produced mechanically has been reached, this minimum dimension yields what is called a colloid. It consists of an aggregation of only a few molecules, and in that state the original nature of the material in some notable respects has become fundamentally changed. Suspended freely in a medium the particles will be found to possess erratic movements of their own, quite unrelated to the effect of gravity. Moreover, such particles condense upon themselves large quantities of certain gases. This is the phenomenon of adsorption, and in the case of coal or other carbonaceous colloids the oxygen is preferentially adsorbed, until the gas, to the extent of many times the volume of the particle, is thus condensed upon it. Under these circumstances it will appear why the velocity of chemical combination between the carbon of the colloid and the associated oxygen takes place at such a high velocity. Herein also lies the explanation of the fact that carbonaceous colloids, under some conditions, develop explosive energy. This occurs, apparently, when the amount of air holding it in suspension is such that practically the total quantity of oxygen contained therein becomes adsorbed. Beyond this volume no more oxygen can be condensed, but, the dilution of the mixture being greater, the separation of the particles is wider, so that the velocity of the combustion is retarded; to state it otherwise a detonating wave then cannot develop because it cannot be transmitted on account of the gap between the particles. In crushing coal, as practised today, only a fraction of it becomes subdivided to colloidal dimensions, and it is evident that enormous possibilities exist for improvement in such details as the methods of preparation, determination of the conditions favoring maximum adsorption of oxygen, the admixture with air for feeding into the combustion chamber, and similar problems. The volume written by Mr. Herington treats these theoretic features lightly. For information of that kind the reader must resort to periodical literature, for it has not yet become crystallized in book form, and much remains to be investigated in our research laboratories. The thing, however, that Mr. Herington has done, which is an important achievement, is to discuss correctly and fully the present state of the art. On this account, and because he gives the detail so abundantly, the work is of great value. He tells what coals yield the best results under the existing systems of handling it, how the coal is crushed, the efficiency of a large number of different machines, costs of preparation, influence of moisture on the thermal efficiency, how to dry the coal economically, and the practical means adopted for successful feeding in cement kilns, boiler fire-boxes, and reverberatory furnaces. His summary of the earlier use of pulverized coal in copper metallurgy at the plants of the Canadian Copper Co., and at the Washoe Reduction Works, at Anaconda, will be of special interest to mining engineers. The book was issued before the brilliant success recently achieved at the smelter of the Nevada Consolidated Copper Co., at Ely, Nevada. The growth of this practice of firing with pulverized coal in reverberatory copper-smelting bids fair to drive oil out of use for that purpose. The data collected in this volume will be of great value to engineers who wish to keep abreast of the times. It gives the practical facts necessary as a preliminary to a more exhaustive study of the subject. C. DeK.

Coal Catechism. W. Jasper Nicolls. Pp. 249, index. J. B. Lippincott Co., Philadelphia, 1918. For sale by 'Mining and Scientific Press.' Price, $1.50.

This handy little book is a reprint from an edition published originally in 1915, and is in fact a development from a catechism that has been before the public since 1898. Such continued demand shows that it fills a want. Mr. Nicolls is a member of the American Society of Civil Engineers, and is a thoroughly competent authority; in addition he possesses the unusual merit of being able to explain that which is essential as an answer to pertinent questions that could be propounded by any bright person. This is the peculiar quality of mind required for presenting knowledge in the form of a catechism. As a short and easy course to a considerable volume of information regarding the occurrence of coal, the mining of coal, and problems of distribution, together with the elementary theory of heat, and of power-development, the book is to be commended. The chapters on metallurgic uses, gasification, and coke are quite satisfactory, but we regret that he has not added a chapter on pulverized coal and an extension to his chapter on by-products in coking, considering the recent interest in those subjects. The book will continue to be useful.

The Elements of Coal Mining. By Daniel Burns, London. Pp. 236, ill., index. Longmans, Green & Co., New York, 1917. For sale by 'Mining and Scientific Press.' Price, $1.10.

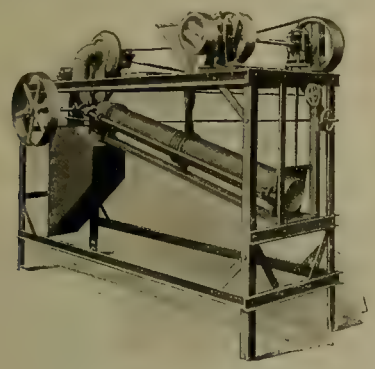
In the writing of elementary treatises upon technical subjects the English practitioners possess a peculiar knack, which generally gives a high practical value to their productions. This praise may be justly bestowed upon the neatly printed and well illustrated book before us. It is distinctly elementary, but it deals with the problems that arise in everyday operations, and tells how to overcome the difficulties that are encountered. It is a book that will be appreciated by those having to deal with coal, and it also will be found suggestive in many details regarding mining methods applicable to metalliferous deposits; this applies particularly to methods of laying out coal-veins for exploitation, of supporting roofs and sides, and of ventilation. The chapters dealing with handling water and with winding appliances are most useful.

INDUSTRIAL PROGRESS

INFORMATION FURNISHED BY MANUFACTURERS

THE MEYER DRY CONCENTRATOR

The Meyer dry concentrator marks a new development in the practice of dry concentration, and is the result of several years' experimental work. The concentrator is operated upon the principle of the exhaust instead of pressure. It is claimed that this produces a more delicate adjustment with a resultant increase in the selective action, making a much cleaner separation than heretofore has been possible. Test runs have been made on practically every kind of concentrating ore, comprising sulphides, carbonates, and many of the oxides, while lead, zinc, copper, molybdenum, tungsten, pyritic and complex sulphide ores have been given special attention. It is claimed that extractions of 90% of the metallic content of these ores have been made with a remarkably clean product. Various models are being manufactured. Model B, shown in the accompanying illustration, represents one unit of the concentrator, the mechanical construction being a radical departure from established methods. This concentrator is equipped with an exhaust fan of variable suction capacity, and by means of a blast gate-valve each fan can be regulated so that practically any desired suction can be obtained. The smallest concentrator consists of three units, generally termed 'cylinders', being equipped with one each of the three sizes of exhaust-fan used. The standard sizes have eight and ten cylinders, the cylinders all being of the same size, while the exhaust-fans may be of various sizes or all of one size, depending upon the fineness of the ore to be treated. The standard sizes of concentrators have a capacity of about 25 to 30 tons of ore per day. It is claimed that all of the various sizes of crushed ore from the largest down to dust can be treated with success.



THE MEYER DRY CONCENTRATOR

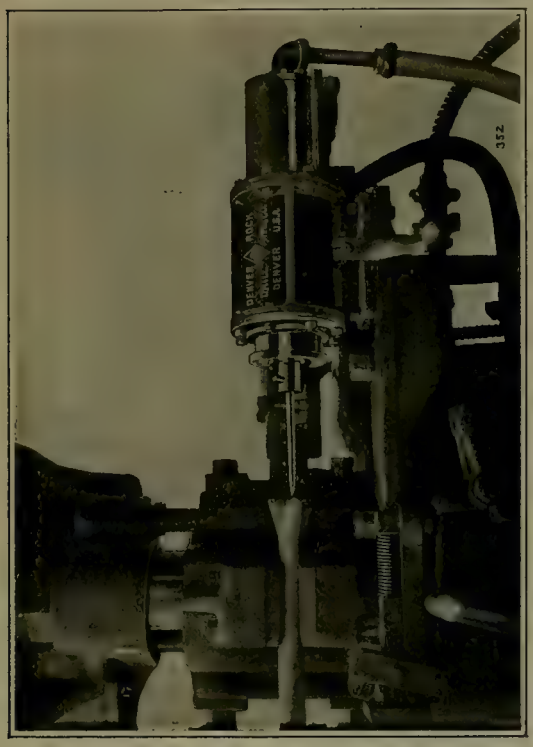
The ore is crushed dry, and a specially designed 'unit' or cylinder of this concentrator receives the crushed ore, the exhaust-fan drawing off all the dust made in the process of crushing. The entire apparatus is enclosed so that no dust can escape into the atmosphere of the concentrating-room. Whatever dust may remain in the ore is eliminated through the exhaust-fan as the tailing is being withdrawn, and is delivered wherever desired. The dust and such finer sizes as it may be desired to eliminate can be stored and treated, if sufficiently valuable, by flotation, cyanidation, or amalgamation. The concentrator is patented. It consists of inclined revolving cylinders into which the ore is fed by gravity through a hopper at the middle point. The cylinders are riffled on the inside, causing the ore to be elevated and tumbled into the middle of the air-current as the cylinders revolve, and the suction of the fan draws the gangue farther up the cylinders with each revolution, while the concentrate, being too heavy for the suction, falls toward the lower or concentrate-end of the machine. The exhaust fan connects with the cylinders through an air-tight compartment, termed a settling-box, which discharges the tailing from the air-current before the fan is reached, the tailing being removed in a steady flow through a small adjustable door in the lower end of the settling-box. Model A of this concentrate is equipped with a light agitating-brush, which revolves within the cylinders, causing a thorough dissemination of the ore. It has been found that in two years the wear on the brush has been negligible. The concentrator is controlled from the concentrate end, the same as in the other models, and several turns of the adjusting-wheel, manipulating the blast gate-valve, close or open the valve in the blast-gate so that the suction is decreased or increased as desired, permitting a smaller or larger size of ore to be fed into any cylinder, and so changing the feed that each size can be run one after the other. The suction force of any fan can be controlled so as to successfully concentrate any size, the range of 10 different sizes being within the capacity of the fan. In case there should be 20 different sizes to be treated an installation of 20 cylinders is recommended. This permits each size to be permanently connected with its own individual cylinder, and once connected it keeps on continuously concentrating that size. By means of this appliance lead sulphide has been separated repeatedly from zinc sulphide and from copper pyrite, while iron pyrite, also, to a considerable extent, has been separated from both lead and zinc sulphides. Tungsten minerals have also been separated from copper pyrite.

The Meyer dry concentrators are made of metal throughout, the cylinders being of heavy sheet steel, while the frame is substantially built of channel and angle-iron. The National Milling & Refining Co., of Canton, Ohio, is manufacturing and marketing the concentrator. Various sizes are being made to meet the requirements of both the large and small operator. Its catalogue describing the Meyer concentrator and the process of dry concentration has just been issued. The company is ready to submit to thorough investigation by mining engineers of the concentrator and its performance. Mining engineers who have witnessed demonstrations of these concentrators in operation in the testing mill at Canton, Ohio, state that an extremely clean separation is made.

W. H. Callan, general manager of plants, and W. P. Pressinger, general manager of sales, have been elected vice-presidents of the **Chicago Pneumatic Tool Co.**, Chicago.

THE MODEL 10 'WAUGH' DRILL-STEEL PUNCHER

The puncher shown in the illustration is a unique and efficient little pneumatic device that is now being put forth by the Denver Rock Drill Manufacturing Co., Denver, Colorado, as an attachment to its model 8 sharpener. Its purpose is to open the hole in the end of a piece of drill-steel while being worked into a bit, collar, or lug. The punch is held in a tappet-chuck. This chuck and a hammer are set



A DRILL-STEEL PUNCHER

in an air-feed cylinder. When opening up a water-hole the punch is simultaneously hammered and fed forward into the steel. The action of the hammer and air-feed cylinder are controlled by a single handle. The device will open a bit or shank in one-tenth the time required to perform the operation by hand. Where such an arrangement is desirable it may be mounted separately or even adapted to other sharpeners.

The National Tube Co., Pittsburgh, Pennsylvania, calls attention by an illustrated circular to the progress that it has made in 28 years in the production of steel pipe. It is interesting to note that steel pipe was first made in this country in 1887, the first year's output being about 300 tons. Comparing the products of years of normal business only, the output of wrought-iron pipe in 1915 had declined to 262,198 tons, from its position at 500,000 tons in 1888, while steel pipe had grown to 2,037,266 tons. This merely emphasizes the change in metallurgic methods within that period. It was about that time when Alexander Holley made his famous reply to critics of the new steel process that he had been so earnest in developing, that "the open-hearth process will live to attend the funeral of the bessemer process." At that time the advocates of bessemerizing were struggling vainly to produce steels to meet the ordinary requirements of wrought and malleable cast-iron. Defects in the steel, however, limited its application to a few large structural uses and to steel rails, while the open-hearth process was demonstrating wider efficiency, and giving promise of the great future that is now a reality. The manufacture of wrought-iron is costly, because an excessive employment of hand labor is unavoidable in the process. The open-hearth steel furnace, by almost wholly mechanical methods, will turn out an enormous tonnage of metal, with great economy in the application of the fuel, and the product is a dependable steel of almost any grade desired, fulfilling the conditions where either steel or wrought-iron would have been specified in the older practice. The tables and curves of progress in the use of steel for pipe, presented in the circular issued by the National Tube Co., therefore, illustrate the advance in metallurgic methods in this country during the last 30 years.

COMMERCIAL PARAGRAPHS

Sutton, Steele & Steele, Inc., of Dallas, Texas, announce the appointment of L. G. E. Bignell as sales manager of their business.

N. C. Falls and **W. C. Doak**, of Toecane, North Carolina, are planning for the immediate installation of mining machinery for the development of asbestos properties in that district.

The Empire Graphite Co., Ashland, Alabama, is considering plans for the immediate re-construction of its plant recently destroyed by fire, the loss being estimated at about $40,000.

The Magnolia Metal Co., 113 Bank street, New York, has recently completed construction work on a large new smelting plant at Matawan, New Jersey. The works will be used for the treatment of antimony.

Joseph Dixon Crucible Co. reports that extensive use of its silica-graphite paint, made by John Gribble, mechanical engineer of the Niulii plantation, Kohola, Hawaii, has demonstrated an unusual resistance to the severe effects of a tropical climate. This is a far more severe test than paint is subjected to in temperate climates.

The United States Graphite Co., Goodwater, Alabama, recently organized with a capital of $300,000, is planning for the immediate development of about 120 acres of graphite properties, to have an initial output of 100 tons. It is proposed to commence work at once on a flotation plant to cost $100,000. B. L. Daddis is president and T. C. Hadley is vice-president and manager, both of Montgomery, Alabama.

Ingersoll-Rand Co. announces a bulletin on portable mine-car air-compressors, designed to meet conditions in the service, for use where electric power is available. The compressor is driven by a bath-lubricated herring-bone gear, enclosed to keep out dirt. The pamphlet is illustrated, and shows the machine at work underground. The same concern has published a circular describing a compact high-speed steam engine, listed as class 'FP,' made in four sizes, developing from 15 to 90 indicated horse-power.

Contracts have been awarded by the **Butterworth-Judson Corporation**, of New York, for construction work in connection with the erection of the large new plant at Brunswick, Georgia, to be devoted to the production of picric acid for the Government. Necessary structures for two sulphuric-acid concentrators, commissaries, warehouses, etc., will be erected at once by Hugger Bros., Montgomery, Alabama. The site for the proposed plant comprises about 1400 acres on Turtle island, in the Turtle river, near Brunswick. An investment of approximately $5,000,000 will be involved in the construction of the plant and $2,000,000 for townsite development. The works will give employment to about 5000 men.

MARCY BALL MILL

"ONE-EASY-STEP"

The pioneer successful ball mill, it has demonstrated its superiority in numerous competitive tests. The MARCY BALL MILL is regarded as STANDARD throughout the United States and many foreign countries. Its economic value as an ore-crushing agent has not been equaled since the invention of the stamp-mill. In closed circuit, it delivers a sufficiently fine product for concentration, amalgamation, or flotation at a surprisingly low COST PER TON.

Made in five sizes and operates either in graded crushing or series system.

Whether you crush ten or ten thousand tons you will do well to investigate the economy of the MARCY.

NOTES 71

MINING ON THE RAND..... 72

Statement by Mr. Hugh F. Marriott on the South African goldfield; progressive improvement in mining practice; the use of deep shafts; application of colliery methods to help solve Rand problems; the limit of ore is banket that will yield a profit; it is a fallacy that the mines of the Rand do not show impoverishment with depth; they are 'unique', but they do fail in depth; Mr. Marriott's figures demonstrate it; the decline in dividends shows it; in seven years the holdings in three big consolidations have diminished in value $204,000,000. M. & S. P., July 20, 1918.

SUSTAIN THE PRODUCTION OF GOLD..... 73

Importance of gold production as the basis of growing credits; insistence of Secretary McAdoo on the necessity for sustaining the gold mines; meeting of gold producers in San Francisco with Mr. Raymond T. Baker, Director of the Mint; ways and means for fostering the industry; bounties suggested; fallacy of increasing the official value of gold; proposal to export to countries that will pay a premium; suggested to exempt gold mines from taxation; cause of the trouble with gold mining. M. & S. P., July 20, 1918.

DISCUSSION

GOLD IS ESSENTIAL

By W. J. Loring..... 75

Gold mining in California a pioneer industry; large population dependent on it; investors in gold mines should not be treated like producers of luxuries; Secretary McAdoo's letter on gold to Mr. Sulzer; false rumor that gold was to be discriminated against as non-essential; duty of Government to protect the gold industry. M. & S. P., July 20, 1918.

IN DEFENSE OF THE ROUGH-NECK SUPERINTENDENT

By H. W. Morris..... 76

The untrained man and his achievements; notable Californian examples; distinction between the 'rough neck' and the self-made man of ability. M. & S. P., July 20, 1918.

ARTICLES

MINING ON THE RAND

By Hugh F. Marriott..... 77

Early exploration; use of bore-holes; difficulties in drilling; shaft-sinking; drawback to use of inclined shafts; problems connected with vertical shafts; ventilation; efficiency of present ventilatory methods; circular shafts; underground haulage; hoisting problems; sampling procedure; stoping practice; filling stopes with tailing; table of gold contents in shillings over stoping widths; production and profit; tonnages, values, and costs; large tonnages do not necessarily mean low costs; evidence of the stability, consistence, and continuity of the Rand deposits. M. & S. P., July 20, 1918.

CASCADE METHOD OF FROTH FLOTATION

By W. A. Fahrenwald..... 87

Agitation by fall of pulp; head-room required; new type of apparatus utilizing that principle, but with economy of head-room. M. & S. P., July 20, 1918.

RIBBON ZINC AS A SUBSTITUTE FOR BRASS..... 88

M. & S. P., July 20, 1918.

MAKING FERRO-MANGANESE IN CALIFORNIA

Development of electro-metallurgic operations on the Pacific Coast; description of the plant of the Pacific Electro Metals Co., at Bay Point, near San Francisco. M. & S. P., July 20, 1918.

THE PRICE OF MINING EXPLOSIVES..... 90

Review of costs of explosives delivered at the mines in South Africa, New Zealand, and Australia; explosives manufacturing plant of the De Beers Consolidated Mines, and its effect in keeping down the cost of explosives for the mining industry. M. & S. P., July 20, 1918.

CALCULATING PERCENTAGE OF RECOVERY IN CONCENTRATION

By Arthur H. P. Moline..... 91

Formulas for calculating the percentage of recovery in milling when the assay-value of feed and tailing and the weight of the concentrate are the known factors. M. & S. P., July 20, 1918.

PRESERVATION OF PIT-TIMBER..... 91

M. & S. P., July 20, 1918.

**"Miners, produce;
Produce to your utmost capacity!"**

came the nation's call. Copper production doubled within the year, our coal production exceeded that of all of the rest of the world. In fact, the entire metal industry was called to again increase production, notwithstanding that 1916's output was many times that of 1913.

Electric light reduced mine accidents and delays; electric drills, cutters and locomotives kept the ore stream flowing to the hoists; electric pumps eliminated delays; electric hoists broke all previous tonnage records and electric trains were often used to rush the ore or coal to electrically operated smelters and refineries or breakers.

Only through electricity's magic power has it been possible to produce this great mineral tonnage, in spite of the shortage of labor.

Both the cost and quantity of marketable fuel necessary for power purposes in mining have been greatly reduced by using electricity from centralized power plants. Electricity produced from water power and used in mining operations releases millions of tons of coal for other industrial purposes.

We of the electric industry are proud of electricity's part in "Conserving our natural resources."

RISES in the prices of metals, namely, copper to 26, lead to 8, and zinc to 8.85 cents per pound, have been followed promptly by an advance in wages at the mines. In Arizona, Montana, and Utah, the copper companies have granted an increase of 50 cents per shift, likewise the silver-lead mining companies of the Coeur d'Alene in Idaho.

YUKONERS and Alaskans, not to mention other mining men nearer the centres of civilization, will have read with pleasure the dispatch from Paris telling how "an American from Nome, Colonel Joseph Boyle" saved Rumanian deputies from exile and was rewarded by a decoration at the hands of the king of Rumania. Joseph W. Boyle is a big-hearted broad-chested Irishman, conspicuous in pre-war days for his dredging operations on the Klondike and prominent during the War for his effective patriotism. We are not surprised that he has distinguished himself, for he is a born leader of men.

'CHROMITE' is the title of a 30-page pamphlet written by Messrs. Albert Burch and S. H. Dolbear, and published gratuitously for them by us for distribution among those seeking or producing this important war-mineral. The pamphlet is now ready; anybody desiring a copy should write to Mr. Burch, at the Crocker building, San Francisco. Incidentally it may be added that the Government has ordered the construction of a road in Siskiyou county, California, to make available 30,000 tons of chrome that Mr. Burch has estimated to be mineable. In the Mining Summary this week we show a plan of the new road and of the region generally.

SALT LAKE CITY has been elected to greatness by natural endowments and no one is disposed to begrudge the distinction, because geographic advantage is a fact that human sentiment cannot alter. It is unbecoming, however, to allow economic superiority, which is a matter of circumstances only, to encourage megalomania. The senator from Utah, Mr. William H. King, did not specifically mention Salt Lake as a permanent abode for the Geological Survey and the Bureau of Mines in bill S.4789, which he introduced in Congress the other day, but the ambition to grasp a goodly portion of the Interior Department from Washington was hardly concealed in the suggested legislation. Mr. King was undoubtedly 'talking for Buncombe', and may his 'Buncombe' give him the honor due. If these great bureaus of the Department of the Interior should be wrenched loose from their proper place at the centre of government and transplanted "west of the Mississippi river", to quote the bill, politicians would demand some rare new plums for party fealty. We suppose Seattle would want the Post Office Department; Reno would soon aspire to the Department of Justice; and Nebraska might specify the fitness of the town of Lincoln as the home for the Department of State. "Resist the beginnings of evil," wrote the author of the 'Imitatio'. The bill was read twice and referred to the Committee on Public Lands. Requiescat in pace!

GOLD as an essential for financial health is discussed at length on another page. As soon as Mr. McAdoo's letter, quoted by Mr. W. J. Loring in this issue, was made public the quotation of Alaska Gold jumped to $4, from its former dead level of $1 per share. This eccentricity of the market is hard to explain, except by manipulation; the idea that the mine increased in value four times by reason merely of a recognition of the fact that gold is essential to the national effort at this time of war is too absurd. The only factor justifying such a rise would be the sudden uncovering in the mine of an orebody containing, say, a million tons of ore averaging $5 per ton.

A KINDLY old lady is said to have remarked to a recruit at Camp Lewis: "Well, my dear boy, are you prepared to lay down your life for your country?" "No, ma'am," he replied, "but I am preparing to make a German lay down his life for *his* country." No mock heroics for him! He understood the art of war, which is to kill your enemy. The report of a German intelligence officer, recently captured, says that the individual American soldier is "very good." One of them had said: "We kill or get killed." This intelligence officer found the American prisoners "alert and pleasing," but shockingly ignorant of military affairs; "for example, most of them have never seen a map, they are unable to describe the villages and roads through which they marched, their ideas on the organization of new units is entirely confused," and so forth. Like most Germans, this intelligence officer imputed to others a stupidity that was all his own. Simply, our boys would

not give away valuable information, and so pretended ignorance concerning vital matters, of course. Meanwhile General Von Ardeene, a high German military critic, tries to lay the American bogy: "What is a million of Americans compared to the ten million well trained and equipped Russians who have fallen out of the battle-line?" He is discovering the difference already. We seem to have heard that the Russians were not "well equipped" except with German pacifist tracts, and "ten millions" seems too flattering to the Enemy. This military critic continues: "We would not be afraid of five million Americans. They do not know what they are fighting for." Yet even the unintelligent officer of the intelligence department confesses in his report that "a certain moral background is not lacking; the majority of the prisoners simply take it as a matter of course that they have come to Europe to defend their country. Only a few of the troops are of pure American origin; the majority is of German, Dutch, and Italian parentage, but these semi-Americans, almost all of whom were born in America, and never have been in Europe, fully feel themselves to be true-born sons of their country." Indeed they do. We venture to add this: The Germans are going to find the American soldiers most unpleasant, they will find them playing the game of war in no amateur spirit, but with a professional intensity that knows only one end, and that is the killing of Germans. It may not be as romantic as it ought to be, but it is the one sure way to end this War and bring the Germans to a realization of the fact that they proved themselves the biggest fools in human history when they thought they could place their military heel on the free peoples of the earth.

Mining on the Rand

In this issue we publish an authoritative and interesting article on the great South African goldfield by Mr. Hugh F. Marriott, during recent years consulting engineer to Wernher, Beit & Company and to the corporations controlled by that famous firm of financiers and promoters. The article was delivered as a presidential address before the Institution of Mining and Metallurgy, in London, so that it has several claims upon the attention of the profession in the United States. Mining, as Mr. Marriott says, is a subject less easy to discuss than metallurgy, because the older art depends so much upon local conditions, but this need for adaptability gives it a peculiar technical interest. Mr. Marriott reviews the progressive improvement in mining practice on the Witwatersrand from the inside and gives outsiders an excellent idea of the adaptation of method to the gradual expansion of local operations until they became among the most impressive in the industrial world. The engineers of the Rand have been proud, to the point of self-sufficiency, of their accomplishment, and not without reason, but today, of course, our big copper mines are worked on a much larger scale and present a much wider range of technical procedure, due in part to the greater complexity of the metallurgy required to recover the copper as compared with that which suffices to extract the gold. The value of diamond-drilling, for exploratory purposes, is made clear in Mr. Marriott's résumé of early days on the Rand. He himself did a good deal of this work skilfully and we do not wonder that he dwells upon it. Next came the sinking of deep shafts, and the equipment of them with special hoisting-engines, a department of technique in which American engineers, notably Messrs. Hennen Jennings, Hans C. Behr, A. M. Robeson, and R. M. Catlin, took a prominent part. The increasing depth of the mines, and the inevitable tendency toward subsidence as the stopes became extended under the overhanging wall of the lode, rendered the incline dangerous as a main entry and caused the engineers to plan vertical shafts of large capacity. In doing this work resort was had to colliery practice, leading to the engagement of several colliery engineers, notably Mr. H. Stuart Martin, and under their auspices the circular shaft and multiple-stage hoisting were introduced. At this time also the importance not only of ordinary ventilation, but of ensuring a lavish supply of fresh invigorating air to the workers, was realized in practice. Then came the dust problem, intensified by an epidemic of phthisis, threatening the vitality of the miners, and that of their white overseers. The use of water in sprays and through the drills, together with the aid of respirators, has done much to mitigate this evil, which at one time threatened to decimate the drillers and trammers. Notable improvements have been made in pumping and haulage, as Mr. Marriott indicates succinctly. He refers to the inclusion in the ore-reserves of rock too poor to yield a profit and emphasizes the fact that the prime object of mining is to exploit mineral at a profit. In this department of mining economics he has exercised a healthy influence; he has used it against the inclusion, as ore, of 'banket' that under no reasonable expectation could be mined at a profit; he has recognized the fact that the only real 'profit' is one that is divisible among the shareholders—or, at least, among the controlling houses. The statistics of the Chamber of Mines will remain ludicrous for all time on account of their utterly misleading figures of 'cost' and 'profit', as Mr. Marriott knows, for he has tried hard, and successfully, to introduce a more scientific system of accounting into the reports of the important companies with which he is connected. On this subject he is entitled to be heard with respect. We have published his lengthy address in full for this reason, for its general interest, and also because we have recently criticized him frankly for his pathetic attempt to substantiate the fallacy that the mines of the Rand do not show signs of impoverishment in depth. In the early stage of development much timidity was felt concerning the continuity of the ore in depth; such timidity gave place later to the confidence that justified deep mining on a large scale and eventually stimulated an unreasonable expectation of indefinite persistence. This childish belief still obtains. It is curious that, well-

informed and widely experienced as were the leaders of the profession in South Africa, they did not profit by the evidence afforded by the Calumet & Hecla conglomerate, which is a 'banket,' likewise rich in metal, and constituting a lode extensive both in strike and dip, but not without definite limits to its enrichment in both directions. Even to this day it is assumed at Johannesburg that the so-called reefs of the Rand are unique. In some respects they are, as Alexander and Napoleon were unique, but just as surely as Alexander and Napoleon were human, and died, so surely any deposit of ore, however remarkable, must fail in depth. Men think all men mortal but themselves, mine-owners believe that eventually all mines must 'peter out' except their own. Shareholders are encouraged to anticipate an indefinite persistence of ore, and their ignorant optimism is only too often encouraged by engineers that know, or ought to know, better. Mr. Marriott returns to the charge. Of course, nobody takes the yield 'per ton milled' as the basis for an argument on impoverishment in depth, knowing that the decrease of cost incidental to expansive operations and improved technique tends to lower the grade of ore that becomes profitable. On the other hand, the selection of a specified grade, say, 35s. per ton, as the arbitrary limit to 'rich' ore, ignoring the large tonnage of much richer ore won in the upper workings, is equally illogical. In his address Mr. Marriott refers to the compilation that he had the pleasure of exhibiting to the members of the Institution in 1914, and on this later, more auspicious, occasion he appears to have exhibited a similar, but more complete, compilation of the same kind as "concrete evidence of the various gradations of gold deposition." The compilation was a longitudinal section of the Central Rand on which the exhausted stopes were marked in blue, the 'rich' ground in red, the poorer, but profitable, ground in orange, and the unprofitable ground in yellow. We are not sure of the colors, but the scheme was about as stated. This exhibit might have been evidence if his 'rich' ground had not been delimited on a basis much below the current yield, say, of the Robinson and Robinson Deep mines, and, of course, still further below the yield of these and other mines in their earlier years of production, before they became 'deep'. Such evidence is non-scientific; it is not the kind to submit to a technical society. Turning to the evidence on which he appears now to rely, namely, the record of the Village Deep mine and of its neighbors, we venture to say that while the Village Deep has the deepest workings on the Rand, it is a fact that the neighboring deep shafts of the Jupiter, Cinderella, and Simmer Deep, expose ore so poor that they have been abandoned. The tabulation of yields, given on page 83 of this issue, is interesting, but it proves more than Mr. Marriott intended. It will be noted that he gives the average yield of equal blocks of ground along the strike for 40,000 feet, covering the Central Rand. At about the centre are the Village Main Reef and Village Deep, making a fine showing of persistence, at least of ore of average grade, namely, 30 to 35s. per ton. On the edges, however, the blocks average at one end, 24, 21, 28.3, 20, 19.33, and at the other end, 31.10, 20.65, 24.77, 29.33, 27 shillings per ton. The table, in effect, is the graph of an ore-shoot, in the centre of which is the Village Deep shaft. He omits the first 1500 feet. Why so much? Oxidation ceases locally at 300 feet below the surface. The truth about the Rand is better exemplified by the second of the group of blocks as given in his tabulation, namely, from E to I, covering the Robinson mines, the yield of which for the five horizons of 1500 feet each is 66.74, 45.12, 40.19, 32.12, and 27.41s. per ton. In short, Mr. Marriott cites an exception to prove a rule. He knows better. When orebodies become impoverished in depth they do not decline in grade uniformly; bunches of rich ore may persist long after other parts of a lode have ceased to be profitable; impoverishment is marked by a restriction of the orebody or a shrinkage in the length of stoping ground. What are his compilations and tabulations worth in face of the fact that out of the £7,095,066 in dividends paid by the mines of the Rand in 1916 (we have not received the details for 1917), only £2,233,810 came from the mines of the Central Rand, as against £3,650,220 out of a total of £8,887,185 in 1910. During the interval of six years the new and relatively shallow mines of the Far East Rand have helped to redress the impoverishment of the older mining area to such an extent that in 1916 they contributed £2,471,083 in dividends, as against only £778,250 in 1910; and at the present time the market valuation of nine of them exceeds that of the 40 productive mines in the Central Rand. We refer Mr. Marriott to the bank-books of the trusting shareholders, who, in seven years, have seen their holdings in three of the big consolidations, namely, the Crown Mines, Rand Mines, and East Rand Proprietary companies, diminish in value $204,000,000. The decreased valuation of the very mines to which Mr. Marriott refers so optimistically is suggested by the quotations for the shares of the Rand Mines, Ltd., which, in seven years, has depreciated $52,000,000. Mr. Marriott should propound his fallacy, his grossly misleading fallacy, to the horse-marines, not to an institution of mining engineers.

Sustain the Production of Gold

No official of the Government, no committee in charge of war preparation, no representative man anywhere has ventured to suggest that gold mining is a non-essential industry. The disabilities under which it has labored have, however, been overlooked until recently in the hurry to build ships and to manufacture shells and powder. Even the Treasury Department has been so concerned with the trying task of financing the War as temporarily to disregard the difficulties that the gold producers were facing on account of the enormous increase in costs. Suddenly, however, Secretary McAdoo awoke to the fact that the industry was doomed unless measures for relief were taken promptly. At his request a hearing was given last week in San Francisco by Mr. Ray-

mond T. Baker, Director of the Mint, to the gold miners of California, at which ways and means for saving the industry were considered. Prior to that Mr. McAdoo had written to Mr. Charles A. Sulzer on this subject, making the unequivocal statement that, "at no time has this country so much required the largest possible production of gold as at present. Next to food and ammunition gold is one of the most needed war essentials. In order to face the enormous amount of Government bonds required to finance our war expenditures a large credit-structure will inevitably be erected on our gold reserves, and it is necessary that those reserves, which are the foundation of the structure, shall be maintained on the broadest possible basis." Confirmation of this authoritative opinion has been given by many of the leading financiers of America. The importance of gold mining, therefore, is not being debated; the question is merely that of finding a practical means of fostering it.

The California Metal Producers Association has laid before the authorities at Washington the facts regarding the stress of weather against which the gold miners are contending, and Mr. Charles G. Yale has made a special report on the subject at the request of the Treasury Department. The value of the gold produced in the United States, including Alaska and the Philippines, was $84,456,600 in 1917, being $7,133,700 less than in the previous year. It is estimated that the output this year will decrease 35% unless an effective stimulus be applied. In California the decline in the first six months of 1918 has been alarming. The output was 66,668 ounces, against 89,830 for the corresponding period of 1917. In one of the leading districts of the Californian gold belt the cost this year has increased $1 per ton, against a recovery of $7 per ton of ore. On the Mother Lode, which yields 46% of the total output of the State, the added cost has been nearly as great, and the average recovery is about $4.20 per ton of ore; this shows how the industry is threatened. The difficulty is aggravated by the growing fear among the miners that gold mining is destined soon to end, and, as a result of this apprehension, an exodus of labor to more promising fields has taken place. The first and most obvious remedy that would serve to hearten the gold miners is to secure a definite order from the War Industries Board placing them on the priority list. Some complaint has been made that supply-houses have discriminated against the gold industry by declining to contract for steel and other materials beyond immediate requirements. No industry can prosper if placed on such a hand-to-mouth basis. The War Industries Board should stop this at once. The next problem is to relieve the stress caused by exorbitant prices. Gold, as the standard of reference for all markets, bears an immutable relation as regards a unit quantity of the metal to the unit of exchange. All values, all wealth, all credits, are based on the fixedness of that relation. To tamper with it is to undermine the whole credit structure of commerce and of nations. As we pointed out in a recent issue, the real trouble that overshadows the gold industry is the consequence of mistaken policies at the beginning of the War whereby the profiteer was permitted to escape from Governmental restraint. Only direct and specific remedies will suffice to rescue an industry that already confronts an operating cost as great as the market value of the article produced. Had a more rational plan been followed the disparity between the purchasing power of gold and the cost of its production could have been obviated. The problems of individual and national credit would then have been simplified. It was not done, however, and as one result we now confront a shrinkage of the very basis of our credit. Not only would such a shortage of gold be serious during the War, but it must be remembered that the closure of mines at this time would involve a shortage of gold for many years. Mines that are operating on a narrow margin of profit at all times will not soon resume if forced into idleness. Deterioration of plant and equipment, rotting of timbers underground and collapse of stopes, gangways, and shafts, inevitable under these circumstances, would discourage revival of the industry unless gold were to command a considerable premium. That is an evil from which the Nation may devoutly hope to be spared. The peril of it will increase unless gold mining be sustained. In an effort to escape from the dilemma, proposals are being made that would be condemned as wrong in principle were it not for the serious peril confronting the gold industry. The plan that seems to have gained the larger number of adherents is to pay a bounty of $10, or some would have it $20, per ounce on all new gold produced. The American Mining Congress is urging this idea upon Congress, with the approval of many Western miners. It is a crude and reactionary method, but, for a time at least, it would be effective. That it would prove a relief for the duration of the War, and through the period of reconstruction afterward, is open to serious doubt. It is like keeping a patient alive by stimulants instead of finding a cure. Nevertheless it has something to commend it, whereas the proposal to increase the unit value of gold is a contradiction in terms. That notion seems to have been advanced independently in America and in England. Another suggestion, which must appal sane financiers, is to permit the exportation of new gold to foreign markets at a premium. Such a course would precipitate a panic and would force gold to a premium in our own country. We may mention a much simpler method for relieving the stress, namely, to exempt gold mines from Federal taxes, and to supplement this by according similar exemption from local taxation. On the time-honored theory that gold belongs to the sovereign, this mark of sovereign favor and need, on behalf of the sovereign people of this democracy, would introduce no new and extraordinary principle. It would merely accentuate the distinction of the monetary metal as vitally necessary for the Nation's financial health and for the stability of its public obligations; it would be no more an unfair discrimination than the exemption enjoyed by certain bonds, and it would tend to make gold mining, if not the most profitable, at least a gilt-edged industry.

Gold is Essential

The Editor:

Sir—In your issue of June 29, I am pleased to note that you deal with 'The Slump in Gold.' I need not attempt to cover the same ground that you have so ably covered, but I will deal with another side of the situation.

1. Gold mining in California, and elsewhere, has usually been the pioneer industry from which all other industries have started. So old is gold mining that it has become a part of our national business. Furthermore, the stoppage of gold mining would cause great local dislocation to business, and hardship to those who for several generations have depended upon gold mining for a living. There are thousands of men engaged in gold mining who know nothing else, and to take away the one thing known to them would create great hardship.

2. The investor also should have some consideration, as he has invested his capital in gold mines, expecting to be as well treated as if he had made his investment in any other business. People with money to invest are an asset to the country, and should have the protection of the Government, as without moneyed people the development of our resources would be very slow. This is a question that all must agree is so much in favor of protection, that it is useless to waste time in its discussion.

3. When an industry has persisted for sixty or more years, as gold mining has done in California, it would be a great calamity to the State to peremptorily close down the mines, because it would be as dislocating as if some large cotton-mill in an Eastern town closed down after having been the main support of the community for many years.

The Secretary of the Treasury has already acknowledged that gold is an essential, as you will see from the following letter addressed to the Alaskan delegate in Congress:

"I beg leave to acknowledge receipt of your letter of June 1, in relation to the present conditions surrounding the production of gold in Alaska. I fully appreciate that, with the rising cost of raw material and labor and with a fixed value for their output, the gold miners of the world are facing difficult conditions. I should be sorry, however, if for this reason there were any relaxation in the effort to produce gold. At no time has this country so much required the largest possible production of gold as at present. Next to food and ammunition, gold is one of the most-needed war essentials. In order to place the enormous amount of Government bonds required to finance our war expenditures, a large credit structure will inevitably be erected on our gold reserves, and it is necessary that those reserves, which are the foundation of the structure, shall be maintained on the broadest possible basis.

"The United States and its associates in the War are heavy purchasers of raw materials and other commodities for the War in many neutral countries, and our war requirements make it impossible for us to pay our bills in those neutral countries as we have been in the habit of paying them in times of peace, namely, through the shipment of manufactured goods and commodities which those countries are eager to buy from us. This means that a certain amount of debt to those countries must be paid for in credits or in gold.

"This brief statement will, I hope, make clear to your constituents the great necessity that exists for the maintenance of gold production at the maximum point. The man or the community that maintains or increases its production of gold in the face of difficulties and discouragement is performing a patriotic service which deserves recognition no less than the more obvious but not less useful services that are more in the public eye."

It will be noted that Mr. McAdoo states, "next to food and ammunition, gold is one of the most needed war essentials." This being the case, why should gold miners be awakened every few weeks by a scare report that, as "gold is considered by the Government as non-essential," freight and supplies accommodations hitherto enjoyed would be suspended. At the present moment I am suffering from such a report given out by a representative of an important hardware house in San Francisco, to the effect that his house had instructed him to take no orders from gold mines for iron and steel, as the Government considered gold non essential, and the mines would close down. This report has been spread broadcast throughout the Mother Lode region.

Upon the occasion of my last visit to the Mother Lode mines under my control, I was asked by many of my employees the meaning of the statement, as they were forced to work for a living, and stated that they would be leaving for steady employment, etc. I am responsible for the operation of three gold mines, the Plymouth Consolidated Gold Mines, the Carson Hill Gold Mines, and the Pacific Coast Gold Mines Corporation. The first two are producers, while the latter is being developed on two new levels after sinking the main shaft from 1800 to 2300 ft. We are also trying to build a mill to treat 300 tons of ore daily. It will be seen how disconcerting it is for us to have these reports started from time to time with the result that our labor becomes uneasy and scarce.

I would strongly recommend that gold be given a place in the essential list, and I hope that it may be near the top. There can be no question as to its necessity in greater annual production now than at any other period in the history of the world. Gold has, as you say, depreciated in purchasing power, caused by the War, while base metals have appreciated in purchasing value. There are a few ways that gold can be cared for as it deserves for the good of our country: Place it upon the essential list where it belongs, and remove as much taxation as is within the power of the Government until twelve months after peace is declared. Even this will not compensate the gold miner for his greatly increased expenditure on account of increases in wages and supplies, but he would be quite content if he felt that for all his efforts to produce gold, which is so much needed, he was receiving the recognition of the Government that gold mining deserves.

It is not sufficient for Mr. McAdoo merely to say that we should increase our output of gold. If gold is as important as he says, namely, third on the list of essentials, then why not at once place it upon the essential list and give it the proper rating so that we, as gold producers, may feel that we may expect the same consideration as producers of other essentials. Mr. McAdoo, I am sure, would be surprised if he really knew the true situation regarding our gold-mining industry. Several of the largest producers are running short-handed and are contemplating closing down, while several have already closed down.

It is too bad indeed that the gold producers have had to face these uncalled for fights to maintain our production, but the struggle will be fruitless for us unless we receive the support that we deserve, which Mr. McAdoo admits is due us.

I hope that this question will be discussed in your columns by other producers.

W. J. Loring.

San Francisco, July 5.

In Defense of the Rough-Neck Superintendent

The Editor:

Sir—In the article 'A 10% Tax on Commodities,' appearing in your issue of June 22, a great injustice is done the 'rough-neck,' and the business-man.

In a life-time experience of selling mining machinery, and mining supplies, the aggregate of the transactions running into millions of dollars, the number of times commissions were paid to buyers, or to those who had charge of the buying, could be counted on the fingers of one hand. The average business-man detests the practice of paying commissions. A buyer has to plainly ask for it, before it is paid, and strong hints on the subject are not met. Rather than lose business, a commission will generally be paid, but not always.

Now as to the 'rough-neck,' as you term him. He is the father of mining. My experience does not extend beyond California, but certainly the old-time mine-managers in this State would compare favorably with the best of today. They mined the ore just as cheaply, followed up the ore as intelligently, were well versed in the reduction processes of their day. I was intimately acquainted with William Johns, and William James, who were in the different capacity of manager and superintendent of the different properties of the Sierra Buttes Gold Mining Co., and the Plumas Eureka Gold Mining Co. Mr. James subsequently went to South Africa. Many millions in bullion was extracted from these mines, and more than $5,000,000 paid the stockholders, under their management. J. F. Parks, the superintendent of the Kennedy mine for many years, is another man with whom I was fairly well acquainted. The purchases these men made would run into the millions, but anyone who knew them, knows that a hint at a commission, or so much as a present of a box of cigars, would have been resented in a manner that would have been very uncomfortable. These men are but fair types of many like them, who are dead now, but who worked hard and faithfully for different companies who employed them, and obtained good results.

George W. Starr, superintendent of the Empire mine, at Grass Valley, Webb Smith, superintendent of the Kennedy mines, at Jackson, and Fred J. Martin, superintendent of the Utica mine, at Angels Camp, are the legitimate successors of the men mentioned above. All would come under your term of 'rough-neck', yet their work would compare most favorably with the educated mining engineer, whom your article places on a plane far above.

The business-man of California, selling mining machinery, and mining supplies, is not running around trying to find someone on the staff to pay a commission to, to introduce his goods, and the man on the staff is not looking for the commission.

H. W. Morris.

San Francisco, June 24.

[Mr. Morris has misunderstood our reference to 'rough-neck' superintendents. It is ludicrous in such a connection to mention the names he cites—the names of men that we know and honor just as he does. Apparently he assumed that we class every engineer that is not a college graduate as a 'rough-neck'. This is absurd. The reference was intended for quite another class of men; the low type of smart working-man without character that happens to be lifted to a position of responsibility in a frontier community. It is unnecessary to specify further. For the rest, such men as are cited by Mr. Morris will be the first to agree that the morale of the profession has been raised by the increase in number of those that have undergone a special technical training for their work, because, among other reasons, these include their own sons.—Editor.]

Fluorine is suspected to have been partly responsible for intense sericitization in some copper deposits containing large quantities of chalcocite. The fluorine is thought to have been in the primary mineralization waters.

Mining on the Rand

By HUGH F. MARRIOTT

Introduction. *A presidential address should have for its primary object the dissemination of information in a concrete form, and in considering what should be my subject tonight I was met by the point so often expressed that, whereas the metallurgist can select a process or a plant and construct therefrom a thesis which becomes a standard statement, the miner has no definite line to adopt, for every case he deals with is different. It may be said of metallurgy that success depends upon invention and improvement of process, while in mining, success mainly depends upon past experience. You cannot learn mining from a book.

It has, therefore, occurred to me that the best use to which I could put this occasion would be to follow through some of those points in the history of the Rand with which I have been closely connected during my professional life which do not appear in textbooks or in company records, in the hope that they will be interesting to those who know them, and will also help to direct the action of those who are now only commencing a professional life.

I have had exceptional opportunities for following the course of operations and the growth of the Rand in that the mining house with which I have been connected since 1891 controlled in that year 33.8% of the monthly output of the fields and now has charge of the operations of mines amounting to 49.1% of the output. It is of interest to note that in 1891 the average monthly output was 62,426 oz., or £213,027, while the average monthly output for 1917 was 728,868 oz., or £3,096,035.

Today the mining student who has qualified has opportunities for enlarging his mind undreamed of a quarter of a century ago, but a hard schooling in the practical side of the work remains as necessary a portion of his training as ever. Men fitted for the more responsible positions in the mining world are found among those who have made a success of each stage of a hard-fought youth —not among those whose ascendancy has been like that of the comet. It is the steady record that produces the best results.

The Rand started with very keen man who were bound to progress, not only on account of the success of the industry and of their own natural ambitions for advancement, but the stimulating air of the high plateau was in itself sufficient to convert even a sluggish constitution into a means of rapid thought.

The possibilities of the extensions of the deposit were rapidly grasped and raked from end to end, and, after the 'deep levels' had become an accepted fact, in 1892, the outlying work that has been done since consisted mainly of going over ground that had already been tried again and again.

Where, then, has been the cause of improvement in succeeding years if the main facts of existence have been known for so long? It has been one of method, partly evolved by experience gained locally, and also in considerable measure by judicious introduction of experience gained in other fields and other channels of knowledge in the world. This should be so, for a self-centred isolated community produces in time the same faults that come from in-breeding, not the least being intolerance to outside co-operation and intellect, which only acts to the detriment of those who seek to preserve their insularity. The minds of individuals move rapidly, and the minds of masses move slowly, and it may almost be said in inverse proportion to the size of the masses. We want no more forcible example of the necessity for rapid action and the exercise of individuality as contrasted with the expression of mass thought and movement than the present world struggle.

Let us see how improvement of method has had its effect and what scope still lies before us for further progress. In the early days those mines which started well on rich reefs continued their successful career, and made the fortunes and reputations of many who by foresight or good luck obtained control of them. Then came the steady hunt for gold in the gaps and on the extensions to the proven mines. It is in these directions that science and experience have had immense advantages over the old rule-of-thumb methods of development.

Early Exploration. Following on the results of the prospecting trenches and mining operations from the outcrop, the most progressive method of the early days was to sink boreholes to cut the reef at comparatively shallow depths. The first of these was at the Village Main Reef, where in 1890 the South reef was intersected at a vertical depth of 517 ft. It is interesting to observe that while in those days there was a doubt about the existence of the ore deposit even at this short distance from the outcrop, today it is not considered an undue risk to invest a million and a half in equipping a property in which the reef lies at a depth of 5000 ft., and the major portion of the expenditure has to be undertaken before the reef is cut. The second effective borehole was on the Rand Deep Level ground, and was the first proof of the continuation of the ore below the boundary of the Crown Reef. This was sunk in 1892, and cut the South reef at 823 ft. Intense interest was taken by the community in this borehole, and it was on the results therefrom that the ground immediate to the dip of the working outcrop-properties was recognized as having a definite value.

These early boreholes had a twofold object. The first

*Delivered before the Institution of Mining and Metallurgy, London, on April 11, 1918.

was to prove the continued existence of the orebodies, for in those days, however assured the scientist might have been of the continuity of the deposition, it had to be demonstrated by results to the world at large if the required confidence in the stability of the fields was to be established. The second was to obtain as accurate as possible cross-sections of the reef formation and to furnish material for assays on which to base estimates of the gold-contents of the reefs passed through.

In the first requirement the early boreholes were extraordinarily successful, and as the evidence accumulated it became possible for a skilled observer to determine, from the results brought up, the distance at which the Main Reef series would be encountered to within a few feet. As an indication of the value of the reef the results were not so decisive, but it must not be too readily assumed on the records of past work that no weight can be given to results obtained by this method. On the Central Rand, where the reef formation is compact and lies in hard country, the assay-results from boreholes have in several instances been since proven to be very nearly the average of the reef they intersected; but this again must have been very largely chance, as there are often wide differences between closely spaced min samples. No miner would attempt to value a block of ore-reserves on a single sample.

In the Eastern Rand, owing to the friable nature of the foot-wall of the reef, which portion is also the main gold-carrier, this was often penetrated without previous warning owing to the absence of reliable upper indicators as found in the Central Rand, and as the core was being cut, the hard quartz pebbles often ground up the soft foot-wall shales and dispersed all the fine-gold contents, barely leaving a trace in the core-barrel for the assayer. In the Far East Rand, as in many other cases on different classes of ore, full success has been deferred owing to too close adherence to an assumption of a normal position for the valuable contents.

At the present day it is possible to divert boreholes at some distance above the reef, and to take another section. The exact location of the reef is then known, and the second sample can be carefully drilled. Cores of much larger diameter are now obtainable in this formation by shot-drilling, thus rendering it possible to obtain a more coherent core.

In general it may be said of the returns of values afforded by boreholes that, provided the formation is there, a poor result is no criterion that profitable contents do not exist in the locality. On the other hand, if a rich result is obtained it is extremely improbable that the sample of ore secured haphazard as one solitary representative of a large area should happen upon an abnormally high-grade patch. It is much more probable that the value disclosed will be found to be repeated many times over in the vicinity.

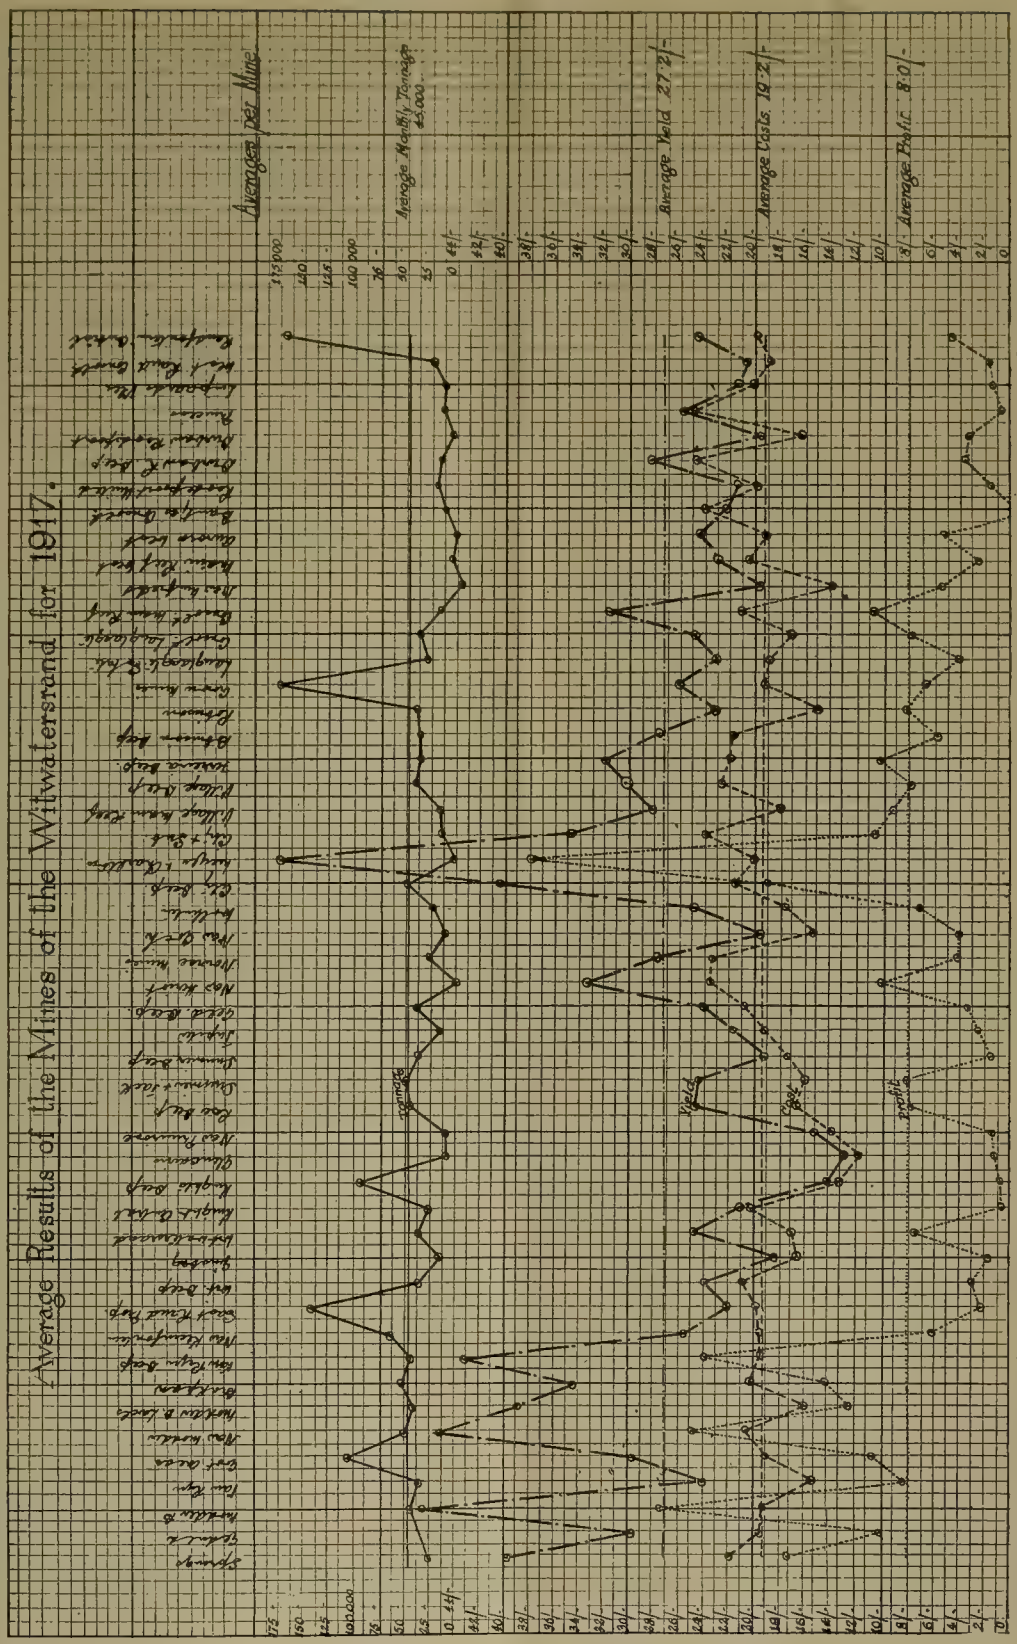
The positions of the reefs at depth having been proved, this indeterminate method of valuation gave way to development by shafts, and then the successful opening up of the rich resources of the Rand at depth commenced in earnest.

Shaft-Sinking. The next step affords material for comparison of present practice with the methods of a quarter of a century ago. Having found the reef and proved its probable character at several points sufficiently widespread, the first shafts were located. The main shafts, which had to do the double duty of prospecting the deposit ahead of the mine and of providing the means of getting the ore out, were then started from the surface either as inclines directly on or under the reef, or as verticals which cut the reef at no great depth, and were there turned off on the underlay and continued down as inclines. These latter, known as compound shafts, have proved to give the minimum of capacity combined with the maximum of expense. The bends seriously restrict the speed of hoisting and shorten the life of the ropes. In addition, the ground above the reef at the bend is usually the weakest in the formation and entails great expense of upkeep.

The incline from surface has much to recommend it, and there is no doubt that in a new mining country it helps to educate the population to underground life by degrees. Timbering is simple to construct and replace; air, water, and electrical connections are more easily attended to; and the ladder-way forms a ready means of communication between the underground workings and the surface, being especially valuable in case of emergency. When the shaft is carried either on or close to the reef, the results obtained during sinking operations are of importance and interest as indicating the future character of the deposit. The chief drawback is instability of the ground as the worked-out areas increase in extent and cause movements which crush the timbers and cause stoppages in the work of the mine. If the shaft is sunk in the foot-wall out of reach of these disturbances, its value as a pioneer in obtaining knowledge of the deposit ahead of the lateral development is largely eliminated.

Recent practice is based on the recognition that it is not wise to try to make the shafts fulfil all these requirements at the same time. The inclines sunk on the reef, while offering the best means of prospecting ahead of mining operations, are recognized as being unstable in character, and only valuable as hoisting-ways until the stopes on the horizon through which they pass are worked out. They are capable of producing all the output likely to be dealt with until the deposit has been sufficiently proved to warrant expenditure in plant on the larger scale. Then, when relative permanence of profitable ore is assured, a central vertical shaft is located and the connections to it so laid out that it can be fed with ore from all over the property, and it will take up and increase its duties as the other channels of supply become inoperative.

How great has been the revolution in mining practice is shown by the fact that before the principle of centralizing the underground transport was introduced, the average number of tons hoisted per shaft per day was 400 tons, whereas now the shafts laid out as described deal readily with 4000 tons in the same number of hours per day, or ten times the former amount. The innova-



Average Results of the Mines of the Witwatersrand for 1917.

tion was not evolved from within by gradual changes. The time-honored method of calling for ore at each and every level of the mine as the ore-bins were filled was too firmly established. The change was effected through the appreciation of the fact that the two great branches of mining, coal and metal, were not so far apart as custom had hitherto decreed, and that each had much to learn from the other. The introduction of coal-mining experience to the Rand and the completion of the first example of colliery practice in hoisting from one central loading-station was sufficient to demonstrate the superior efficiency gained thereby, and the system is now the orthodox method of layout of a new property.

One point in connection with the further development of the centralizing system remains to be solved, and is now being tackled in various ways. I refer to the position which arises in the case of a vertical shaft fully equipped which is already dealing with all the ore tributary to it, either from above the horizon of the shaft-bottom or hoisted to it by means of subsidiary inclines.

There are three methods. First, to deepen further the main shaft from the surface, or, if it has already reached its economic limit, to sink a vertical shaft just alongside, so that the ore hoisted from greater depths can be transferred directly from one to the other by trucks or through ore-bins. This will necessitate longer cross-cuts at each succeeding level, and does not assist in providing reef exposures ahead of the subsidiary mining operations.

The second method may be taken to be the sinking of a main incline-shaft under the reef from the bottom of the vertical shaft, the ore being transferred in one operation as above. This has the advantage that evidence is obtainable of the value of the deposit as the work proceeds, and the minimum amount of cross-cutting is required. The chief drawback is the smaller output obtained from each hoisting-way, thus possibly requiring two inclines to feed the main vertical shaft. There is also the risk that the inclines may be affected by movements of ground at a later stage.

The third method has only recently entered the arena, and consists of a cross-cut from the bottom of the main vertical shaft in the direction of the dip and a sub-vertical shaft sunk from this cross-cut in a position suitable to control all the lower ore included in the estimates of future working.

This system of layout is in the first instance subject to the same criticism as the first method, in that it does not offer facilities for ascertaining the value of the deposit till the work is all completed. But when once the reef is reached, and the subsidiary inclines have also been sunk to the horizon of the bottom of the sub-vertical, it may be found that development can proceed more quickly by this than by any other method.

The chief drawback to this system is that the ore is subject to one more transfer than by either of the other two layouts, and this, if it does not restrict the output, must cause a permanent increase in costs of hoisting.

My opinion is that as regards these three methods no endeavor should be made to arrive at a set rule of procedure, but every mine to be equipped should be considered in the light of the special conditions obtaining and the requirements to be met.

This is a case in which the Rand has to lead in mining practice, and the comparative results of the different methods of multiple-stage hoisting will be of great value to all who are engaged in deep mining.

VENTILATION. One factor which has to receive its due weight in considering the problem of mine layout is ventilation. Here improvement in method has altered the whole aspect of mining and has been more instrumental in removing doubts of the practicability of mining at great depths than any other branch of the science.

In the early days of mining, the ventilation was left to look after itself, and as the air below is always hotter, at any rate at some periods of the 24 hours, than at the surface, a replacement of the vitiated mine air by fresh air from the surface must take place, though sometimes very sluggishly.

Coal mines were the first to introduce artificial ventilation, not from any attention to the requirements of the workers, but to remove the dangerous gases given off from the coal.

I think I am right in saying that it was left for the Rand to initiate the installation of mechanical ventilation on a comprehensive scale as an aid to efficient mining from the point of view of supplying an adequate amount of fresh air to the workers.

The old way of looking at the question was—can it be reasonably shown that the minimum air required by the regulations is passed down the mine? Today the question is how much air do we require to ensure that fresh air is provided in sufficient quantity at every working-face so that the workers are naturally induced to put forth the greatest energy at their work. Sunlight we cannot give below, but fresh air that comes direct from the sunlight is the next best insurance of health, and a healthy atmosphere is the best incentive to intelligent work and an increased output.

Recent researches with the action of dry ventilation on the damp surfaces underground have shown that a considerable reduction of temperature is obtained by the evaporation thus set up. The results have been sufficient to demonstrate that a judicious application of this principle will enable the mines to be carried down some thousands of feet deeper than would have been feasible had no means been found to reduce the rock temperatures which gradually but surely increase as greater depth is attained. As it is, it may be fairly estimated that rock temperatures will not be the limitation of practical mining on the Rand.

The health of the underground workers has also been further assured by the regulations enforcing the use of water throughout the workings to lay the dust caused by drilling. The clean pure air of the mines of today is a benefit which can only be fully realized by those who have worked below in the dust and fog of the earlier days of the Rand.

CIRCULAR SHAFTS. A very decided factor in the ca-

pacity of the deeper mines to produce ore by providing ventilation for the workers, and by the consequent effect on the temperature, is the introduction of the circular shaft on modern lines. The rectangular shaft had reached very large dimensions, with seven compartments measuring over all some 45 by 8 ft. With the forest of timber required for its construction, the equipment and upkeep has become a costly matter, and though the output per skip-way has been increased by improved methods of hoisting to very creditable figures, the design remains, of necessity, very inadequate for ventilation purposes. The increasing activity in the Far Eastern Rand favored the practical solution of the question as the flatter formation and the Carboniferous measures in that district are more nearly comparable to the strata in this country in which circular shafts are the normal design.

The advantages of the first examples had only to be seen to be copied, and today there is no part of the formation which is considered unsuitable for this class of construction. The original cost and the upkeep are both considerably less than in the case of the timbered rectangular shafts. They can be equally well equipped for cages or skips, and the ventilation capacity is much greater.

It will be of interest to some of you to refer to the record for circular shaft sinking which was obtained on the Crown Mines in 1916: 246 ft. was sunk in 30 days, from 685 ft. to 931 ft. in depth, and the walling was completed in 6 days more. The new Modderfontein circular shaft, which was completed in 1912 at a depth of 2258 ft., is 18 ft. in the clear and was sunk at an average cost, including walling, of £22 10s. per foot.

Pumping. Another problem has arisen in recent years for dealing with which the circular shaft is preferable. I refer to the passage of shafts through watery strata. There have been cases of excessive influx of water in the course of sinking shafts in the quartzites of the Witwatersrand series. These have been met by the installation of powerful pumps, and notable records of sinking have been done under trying conditions. Today the conditions on the extensions of the Rand are different, and the shafts in their upper portion have to pass through limestone formation in which there exist fissures connected with underground reservoirs which may produce water in overwhelming quantity. This problem is now well on the way to being solved by the introduction and successful application of the Francois cementation process on the fields. After an investigation of the successful application of this method of shutting off water from workings in this country, and the results of sealing up of the high-pressure water-zone on the East Rand, it is not too much to say that it may be relied on to deal expeditiously with any water difficulty that may be met with in shaft-sinking in the future, provided always that it is properly applied.

Underground Haulage. Another variation in the method of mining that has assisted toward economy of working is the method of laying out drifts. This alteration has been largely brought about by the centralizing system of transport. Formerly the drifts followed the reef as closely as the developers could carry it, and afterwards the ore had to be transported over the track with all its drawbacks to efficient tramming on account of the sharp bends and changing elevations. Now the drifts are put in with a view to their use for transporting the ore, and are often carried a short distance under the reef, which is tested at regular intervals as driving proceeds by cross-cuts for sampling purposes.

The methods of transporting the ore along these drifts are many, and will continue to be so, for the decision as to the best system for the purpose depends on the individual conditions at each property.

When a great and continuous tonnage is assured, an independent transport system by means of locomotives and trains of trucks of large capacity may be estimated to repay the large capital expenditure involved in installing the roads and the rolling-stock, but the development ahead should be sufficient to assure that the capital sunk would be more than returned by the saving in working expenses before schemes of perfection of this nature are undertaken. Endless ropes and main and tail haulages of the designs well known in colliery practice are now generally applicable in mines where the transport service can be laid out along defined lines. They have the advantage of a less expensive road-bed, the use of trucks in normal mining use, and are not limited closely in gradient.

There are cases, even where very large tonnages are involved, in which it is found that gangs of tramming-boys working under a properly controlled system will transport the ore along the levels for long distances at a cost which is so little in excess of that of mechanical haulage that the installation of a power-driven plant is not justified. This method has of course the advantage that the labor force employed is movable at will to any part of the mine. The choice from all these various systems must be governed by the amount of ore to be collected within their range of action and the period over which it is to be worked. Any system of mechanical transport when working considerably under its rated capacity is uneconomical.

The alternative methods of carriage of ore to the surface have not yet had that amount of consideration paid to them which will have to be done when the deposits of ore to be worked are more restricted and more difficult of access, and the profit available from each individual section or block in a mine is more closely calculated. I refer to the question of skips and cages. The skip can more conveniently take the larger tonnage per trip—it can be rapidly loaded and discharged with little extra labor requirements. On the other hand, it is fed from ore-bins which must be of large capacity to meet the needs of the mine. They are expensive to construct and are only useful for the particular section immediately above them. All the different classes of ore that are dumped into them are mixed together and go to the mill as one product. Too often no separate arrangements are made for the disposal of the waste-rock that is produced

in mining-work off the reef, and this also is dumped into the ore-bin, and then has to pass through the treatment plant with the valuable material, thereby adding to the cost, occupying valuable space that might be used in earning profit, using up labor and skilled attention in eliminating it at the successive stages of treatment, and sometimes rendering the actual process of extraction more difficult.

There is nothing in the world more misleading than the figures which can be compiled, and often with every appearance of accuracy, to show that rock which contains gold of less value than the normal cost of extraction can be made to produce a profit. If it is found after the closest critical examination that this is the case, then it can also assuredly be found that the anomaly is due to the disproportionate layout of some portion of the mine or plant, and the proper procedure is to remedy the defect at the source and readjust the proportions, for it is only thus that the true object of mining is attained, namely, to get the greatest profit out of the deposit being worked.

There are many in all branches of the profession and mining business who can never free themselves from the glamor of gold. It cannot be too often reiterated that it does not pay to extract gold from rock of the value of a sovereign if the cost of getting it is 20s.6d., and yet how often is it not found that mining accounts do not include all the current charges against the company's operations and therefore the pay-limit is taken at too low a level and the shareholders suffer loss. This appears to be a digression, but it is so closely interwoven with the argument on the methods of transport of ore which otherwise is restricted to a comparison of direct costs of each system, that I have left it where it comes in logical sequence.

As against the mixed ore supplies from the mine ore-bins, cage hoisting includes some distinct advantages. Ore from any one stope or section of the mine, or even from any one portion of the reef in the stope if mined separately, can be labeled and transported to the surface, passed through the crushers, and carried on to a separate section of the mill where the actual contents can be closely gauged by sampling the issuing pulp. In older practice the actual amalgam from any one section of the orebody thus treated could be obtained in the mill, but with the more recent methods of placing the plates in a separate building this is no longer possible.

Another advantage is the disposal of the waste already referred to, as the trucks containing this would be diverted to the waste-dump, and at a minimum of expense. This alternative involves the capital cost of a larger number of trucks which thus act as storage capacity in place of the bins. It also involves the enlargement of the mine-workings in the vicinity of the shaft so that there is sufficient truck accommodation to ensure continuous hoisting as required. Cages have also the advantage that men and materials are more easily conveyed in them than in skips.

I have said enough on this subject to show that the question involves far more than the mere figures of cost of installation and working, and an investigation of the comparative merits of each system as affecting the whole method of mining and treatment would often prove of value to an engineer engaged in laying out the development and treatment plant of a new property.

Sampling. In sampling and mine valuation there is no radical change to record. Mine samples are taken at closer intervals than used to be considered sufficient, but, on the other hand, owing to the greatly increased dimensions of the blocks of ore constituting the reserves each sample has a greater responsibility, and the greater number will tend to lessen the effect of errors. A review of the last six years shows that the gold extracted in treatment is about 92% of that estimated in the first instance to have been in the ore as blocked out. This estimate cannot be taken too literally owing to the inclusion of development rock, and the varying widths of stopes.

There is still a missing link in the chain of evidence of ore values in that the valuation of the ore as stoped cannot be said to have a definite relation to the ore delivered into the mill-bin, and this connection will probably not be satisfactorily made until the ore sent to the mill is weighed and sampled on a sufficient scale to secure comparative accuracy. In this event this valuation would be the starting-point to correct the estimates made both for the original reserves and the finished product. The system of truck-hoisting already referred to would go a long way toward removing the remaining discrepancies.

Mining. Of stoping it may be said that as an art it is dying out. The old miners who knew their work by intuition are disappearing, and the great numbers of men who have taken to underground work owing to the increasing output have not had the long training necessary for the best efficiency. As a science it is difficult of investigation—there are not enough constants. The best that can be done today is to divide the work up between several skilled supervisors, each of whom has sufficient time to keep continually in touch with every one of the stopes allotted to him. It would be his particular business to learn the characteristics of the ground being broken, and to vary the system employed, when by so doing an increased profit is shown by trial to be obtainable.

Methods of stoping are now often closely connected with sand-filling and waste and reef packing, particularly so in the Central Rand, where, so far as the upper portion of the mining area is concerned, the withdrawal of support due to the progressive extraction of ore has been followed by an equally progressive settlement of the superincumbent strata which sometimes comes into action with detrimental effect on the mine-workings.

To meet this situation as it developed, sand-filling was introduced in 1908. Previous to this date some of the older mines close to Johannesburg had been showing signs of movement, and it became evident that preparation was necessary to meet this tendency, which was bound to increase in intensity as mining progressed.

The coalfields of Silesia formed a good object lesson in the support of overlying ground, and, after the methods employed there had been studied, a similar system was introduced on several of the mines on the Rand. This consisted briefly of the hydraulic transport of sand from the surface down to the stopes through pipes, returning the water by pumps specially installed for the purpose.

Filtration difficulties arose on the Rand which had not been experienced in Silesia. The tailings which are employed for the purpose are composed of extraordinarily hard and sharp quartz grains, and the pipes through which they were lowered in the shafts were cut through in a very short time. Various linings were tried at the points most affected, and progress was being made on these lines which bid fair to overcome the difficulty. Confidence in the efficacy of the sand-filling process had, however, in the meantime become more established, and the more stable method of sinking boreholes of several inches diameter for lowering the sand was being undertaken. It was feared at first that choking might take place, causing long delays, but this was found not to be the case, and after more experience was gained it was found possible to reduce the percentage of water in the mixture largely below the proportions which had been adopted at the commencement from the Silesian practice. This lessens the quantity of water to be returned, and thus considerably reduces the main item of cost.

Boreholes have now been sunk on several of the mines, the deepest being at the City Deep, where a borehole of 7 in. diam. was sunk to a depth of 2000 ft. by means of the shot-drilling process.

It has been found that after the earth pressure comes on the filled areas, the sand is compressed to a greater degree than had been previously estimated for from Silesian results. It is not yet clear whether this is due to the greater pressure exerted, to the difference in the filling material, or to a variation in the method of hydraulic settlement. The effect is that the overlying strata are not immediately supported in their original position, but break away to some extent, thus permitting a certain amount of movement which is subsequently arrested.

Waste-packs are largely used as supports, and their construction has been highly developed on scientific lines. They are, however, subject to a much greater degree of compression than the water-borne sand, and consequently allow of subsequent earth movements of greater intensity.

For purely local purposes the control of the pressure by means of waste-packs or broken ore has been found effective, and indeed has largely assisted stoping operations by loosening the ore in the faces, but from the more general point of view the policy should be to support the whole mass of the ground over the reef to the greatest extent possible in order to protect the deeper mines from the undue pressure which otherwise might be caused by subsidence in the upper areas.

It is found that the areas of disturbance caused by mining operations are largely localized by the great dikes which traverse the reef-bearing strata in all directions. The existence of these breaks, together with the modifications being made in mining practice to suit the changing conditions, should form a sufficient safeguard against any but purely local breakaways.

All these references which have been made to past and current practice are necessarily only of the nature of headlines, but I trust that the description is sufficient to illustrate to engineers who are interested in one or other of the subjects the lines on which they can make further inquiry to meet their particular needs.

Time will not permit of reference to several other branches of mining work in which improvement of method has assisted in arriving at the degree of efficiency obtaining today.

The notable advance made in the mechanical and metallurgical sections of the industry have received due attention by the vigorous and progressive technical societies on the fields, and many a specialist either in mining machinery or in metallurgical practice who has turned his attention to the Rand has modified his first enthusiasm for his projected innovations when he has learnt the amount of research that has already been paid to his favorite subject and the reduced scope that still remains for further improvemeent. This does not mean to imply that perfection has by any means been reached, but that the further improvement of the future is more likely to be attained by close attention to details on the part of those who have an intimate knowledge of the local conditions than by startling surprise involving radical alteration of method.

Organizations of staffs and centralized control of the purchase of stores have materially assisted in the success of the industry, and are rightly included in records of improvement.

Production and Profit. We now come to an interesting part of the investigation, namely, to what extent have these methods of improvement been responsible for the enhanced prosperity of the goldfield, and to what extent has any variation in the gold contents of the ore deposit affected the industry? To answer these questions has required the compilation of figures of some magnitude, but if you will follow me through to the conclusion I think you will find that the results arrived at have repaid the effort.

Previous to the South African War the official publications dealing with returns from the Witwatersrand goldfields did not extend to a statement of the average rate of yield, cost, and profit for each year. Neither is this a very important omission, as the methods of arriving at costs and profits were many and various and often did not reflect to any useful degree the figures that were ultimately required before the divisible profit, which is the only true profit, could be ascertained.

So far as the records have been traced, the costs in the last few years of the 19th century were not far removed from those which obtained during the first years in which normal working was resumed after the war, and these may therefore be taken to represent the earlier standard for general purposes. From 1902 to the present date the

averages for the whole Rand are available, and they are as follows:

	Total tons milled	Yield s.	d	Costs s	d.	Profit s	d.
1902	3,410,813	42	0	25	9	16	6
1903	6,105,016	39	8	24	9	14	11
1904	8,058,295	38	6	24	4	14	2
1905	11,160,422	35	10	23	6	12	6
1906	13,571,554	34	6	22	2	12	6
1907	15,523,229	33	11	20	10	13	3
1908	18,196,589	31	5	18	0	13	5
1909	20,543,759	28	11	17	1	11	6
1910	21,432,541	28	6	17	7	10	6
1911	23,888,258	27	11	18	0	9	7
1912	25,486,361	29	0	18	8	10	0
1913	25,628,432	27	9	17	11	9	6
1914	25,701,954	26	6	17	1	9	0
1915	28,314,579	26	3	17	5	8	5
1916	28,525,252	26	8	18	1	8	2

To those unversed in the practice of mining, these figures might, in the bald state in which they are presented, lead them to the conclusion that the ore in the deposit had depreciated in value as the mines were extended. But to those who are acquainted with the inner conditions, the only positive evidence that is afforded by this statement is that, whereas in 1902 the costs were 25s. 9d. per ton milled, only ore above this figure could be worked at a profit, while in 1916 all ore which gave a yield over and above 18s. 1d. came into the same category. The result of the lowering of the cost has been that not only have the fresh developments of lower-grade ore above the reduced pay-limit been included in the reserves and sent to the mill in due course, but, as each drop in cost has been attained, ore which was previously standing in the upper levels has been taken into the official calculations of ore reserves, which have thus had two sources tending to lower their average grade. Herein lies one of the weak points of the system of keeping records on the variable basis of 'per ton milled.'

Had the returns of new development always been issued as gold contents per unit of area of ground developed, be it foot, yard, metre, fathom, or claim, the successive annual statements of ore reserves would have been comparable and the improvement in methods of mining recognized at its true value, as it would have been shown at once in the reduced costs of working each unit of area.

As the annual yields from the various mines are thus shown to be of no value in arriving at comparisons of the gold contents of the successive zones opened out at the mines are deepened, it has been necessary to construct a new compilation of records practically from the grass roots. Taking into account the many interests concerned, and the varied methods of keeping the earlier records, the inclusion of the whole 55 miles of mines of the Rand would have been infeasible. Further inquiry has also shown this to be unnecessary.

The Central Rand was at the commencement the hub of the industry and has remained so till today. The mines are connected together in one continuous network, and in the centre of operations the Village Deep main shaft has attained the greatest depth in Rand mining, namely, 5350 ft. vertically from the surface and 9800 ft. from the outcrop measured on the dip of the reef. This section of the Rand may be taken for the present purpose as stretching from the west boundary of the Crown mines to the east boundary of the Nourse mines, and measuring about eight miles along the outcrop.

Richness of Ore in Depth. In order to ascertain the original value of the deposit from which the major portion of the gold has been obtained, I continued the compilation which I had the pleasure of exhibiting to some of you in 1914, and it is now completed, as far as it is possible to obtain the details, up to the end of 1916. The reason for which this work was originally undertaken was to obtain concrete evidence of the form finally assumed of the various gradations of the gold deposition, and in this it has usefully served its purpose. As you know, the times are difficult both for private work and also regarding supplies of paper, but I am glad to have been able to have had printed a limited number of copies of a reproduction of the plan. Copies are before you tonight, and you will see that the key to the gold-values denoted by the colors is included on the sheets so that each of you may study the record and draw his own conclusions.

This plan shows the original gold contents of the Main Reef Leader in the Central Witwatersrand as disclosed by mine development operations. The extreme eastern portion, which does not affect the main conclusions, has been omitted owing to printing limitations. The Main Reef Leader was chosen for the purpose as being the most important and consistent gold-carrier, and in offering the advantages of a greatly extended continuous series of exposures for correlation.

I have made a close study of this plan for some years, and have from time to time made forecasts of the future prospects of the deeper levels and have compared them later with the actual results of development. I have never yet been able to ascertain from this accumulating evidence any general indication of depreciation of the gold-values at depth, and my reading of the plan now placed before you is that the same conclusion holds good today.

In order to demonstrate still more clearly the final results of the great mass of evidence which has been brought together to construct this map, the original assay-records have been compiled into blocks of equal area over the whole district. These are set forth in the statement on page 83.

These block-values include all the original sampling results, both payable and unpayable, and may therefore be taken as representative of the original gold contents of the deposit. Next, the average results of larger sectional areas have been compiled from these blocks with a view to providing comparative figures at depth over as nearly as possible equal distances along the strike. Then the whole of the recorded results have been averaged to give one figure of value for each horizontal zone. These have been taken for the purpose of convenient calculation in successive depths of 1500 ft. measured along the dip of the reef. Finally, these horizontal valuations are averaged into one grand total average for the whole of the mines included in the calculation.

It will be seen that the outcrop zone records a considerably higher average gold content than the remainder. This was only to be expected, as it includes all the results

of secondary enrichment which form the residue from denudation, which must have amounted to some thousands of feet.

In order, therefore, to arrive at a final result for the purpose of comparison, the outcrop zone should be omitted, and if this is done it is seen that the average gold-content of the Main Reef Leader of the Central Witwatersrand as disclosed by the original valuation was 32.22s. per mine-ton. Now let us see what bearing the individual zone results have on this figure. The uppermost or second zone on the list is 31.19s., and the lowest or sixth zone is 30.60s., a remarkable degree of approximation when it is noted that they are separated by nearly a mile of workings on the dip.

In the third zone a remarkable rise of the gold-content is noted, which falsified the predictions of many who based their estimates on a descending scale from the mines immediately above, and on the records of gold mines in other localities which have since been proved in no way comparable to the unique occurrence in the Transvaal.

The remaining two zones, the fourth and fifth, closely approximate to the general average, and indeed the whole series of averages now set forth show so little variation in gold-content for the different horizons that scepticism would be expected were it not that the figures are founded on fact carried to the minutest detail.

If any further corroboration of these decisive results should be needed, it is given by the crushings from the mines included in the calculation since the commencement of gold production. The total results for the Central section to the end of 1916 are:

Ore treated, tons	93,468,055
Yielding gold to the gross value of	£170,463,923

or at the average rate of 36s. 6d. per ton milled.

When due allowance has been made for sorting, this is seen to be an extraordinarily close confirmation of the original valuation of 34.2s. for the ore as it stood in the mine, a credit to the accuracy of the samplers and to the ingenuity of those who have been charged with the extraction of the gold.

From the commencement of gold production to the end of 1916 the results for the whole Witwatersrand are:

Ore treated, tons	311,755,786
Yielding gold to the gross value of	£492,364,791

or at the average rate of 31s. 7d. per ton milled.

The total tonnage and yield from the Central Rand represent respectively 30 and 34.6% of the totals for the whole of the Witwatersrand, so that it may be fairly claimed that the conclusions of this investigation can be applied to the whole extent of the deposit covered by mining operations. These figures are conclusive evidence of the stability, consistency, and continuity of the Rand deposits as gold-carriers for all practical purposes.

A further encouraging feature in support of the prospects of the next deeper zones below those already opened out is the number of points at which high-grade ore has been exposed in the deepest workings.

It is thus seen that the gold-contents of the deposit have remained remarkably constant throughout the whole life of the Rand, and that the extension of mining operations and the steady growth of the industry are almost entirely attributable to the improved methods of mining and treatment that have been applied as a result of persistent and progressive research.

The problem today is—what is the best method of working the deeper levels now being entered upon so that the greatest profit is obtained for the shareholders of the mines concerned?

A study of all the evidence I have placed before you lends weight to the opinion, which has already some adherents, that the mode of deposition of the gold in the Central Rand will eventually be found to be not so far removed from that which has been more rapidly proven in the Far Eastern Rand, and that the richer portions of the deposit, while retaining their grade, will be found to be segregated within more closely defined limits. Enquiry should therefore be conducted on lines which will lead to a better knowledge of the characteristics of these channels, lenses, or aggregations of richer ore, and, when located, development should be laid out so that the complete blocking out of ore-reserves should only be carried out in those areas which have been shown by the preliminary driving operations to give undoubted profitable results, while the poorer stretches of country should be intersected by the minimum number of levels considered requisite to prove their low-grade character. In other words, the program should be selective development where the money spent in opening up new mining ground should be devoted as far as possible to the more likely areas, and the sections which offer but small promise of profit should have sunk in them only sufficient expenditure to prove their limitations. This is no new theory in mining, but it has not yet been applied to the older established mines of the Rand. It will necessarily follow that tonnage outputs will be restricted.

The diagram showing the average monthly tonnages and the yield, cost, and profit, with the averages per mine, for the mines of the Rand for 1917 will repay careful study. In character it bears out the deductions made from those similarly constructed for several preceding years. The chief points that stand out are that large tonnage outputs do not necessarily carry with them low working-costs, and that high yields give high profits. It follows, therefore, that the chief endeavor should be to raise the yield per ton from each mine as high as is consistent with the average grade of the definitely profitable ore in the reserves, and to modify the organizations and the scale of the treatment plants to suit the output under these conditions. The evidence now before you leads to the belief that the more general adoption of this policy will be attended by a greater measure of success.

Here, then, we can leave the future to bring what it may, fully assured that behind the average returns of the mines which represent the practice of today there exists a reserve force in the continuance of the high-grade ore at great depths, which, while it brightens the speculative outlook of the mines more directly concerned, may be counted upon to uphold the reputation of the Rand goldfields for a long time to come.

Cascade Method of Froth Flotation

By W. A. FAHRENWALD

During the past few months I have been experimenting with a cascade machine which I believe to be new and which perhaps will be of interest to those working along this line. In cascade flotation the froth formed is the result of agitation and the entraining of air produced by causing a stream or jet of pulp, or rather an ore-water-oil mixture, to be injected into the main body

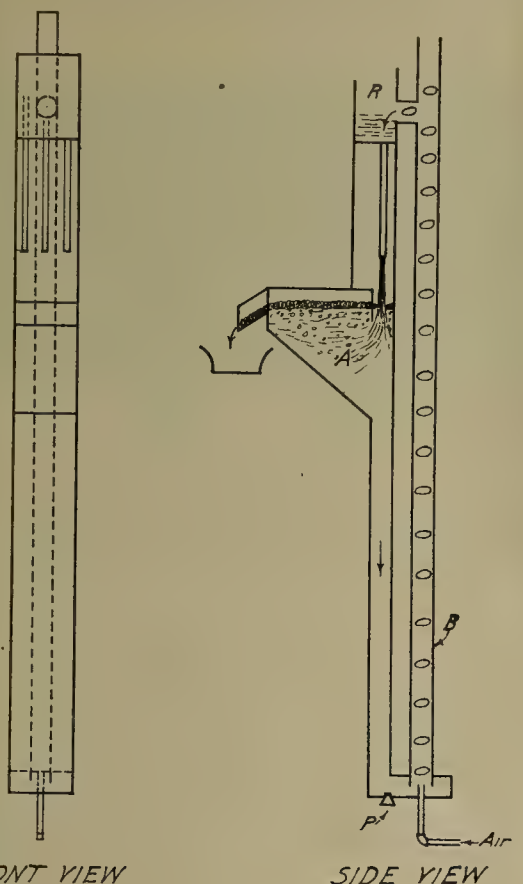

FIG. 1

of pulp. The agitation may be caused by natural gravity, or by artificial means such as centrifugal pumps. By the first method a considerable drop is required between cells in order to impart sufficient force to the stream of pulp. This requires a great deal of head-room in the mill, and necessitates raising the pulp to the uppermost cell. If the second method be used little head-room may be required, but the cost of repairs on the pumps is considerable. Also the first method requires little attention when once installed, while the pumps require more.

The apparatus shown in Fig. 1 and 2 was designed with the object of eliminating mechanical appliances for giving velocity to the jet of pulp and to minimize the head-room required. Fig. 1 shows a sketch of the test-machine used, which is self-explanatory. It consists of a spitzkasten *A*, which extends downward to afford sufficient submergence for the use of the air-lift *B*. The pulp is elevated considerably above the spitzkasten into the small reservoir *R;* from here it is injected into the main body of the pulp by gravity, through three small pipes

FIG. 2

arranged step-like as shown in the front view of Fig. 1. The pulp circulates in closed circuit as shown by the arrows. Pulp may be drawn off at any stage of the test for assay through the plug *P*. I have obtained results with this test-machine that compared well with what could be secured in a mechanical frothing machine, using the same ore.

A convenient arrangement for a commercial size machine, working on the same principle, is shown in Fig. 3. It consists of seven cells, that is, 14 spitzkastens back to back. The feed enters the first cell through the intake pipe *S;* from here, by means of four air-lifts *a, b, c, d,* as shown in cell No. 4, the pulp is lifted to the reservoir

R and thence through the three pipes *x*, *y* *z*, into cell No. 2. This cycle is repeated throughout the series of cells, thus affording numerous chances for each valuable mineral particle to be floated. With this machine no drop between the cells is required; hence the head-room necessary is small. As there are no wearing parts, the cost of operation would be that required for air only. The slender portion of the machine (*m*, *n*, *o*, *p*) could be

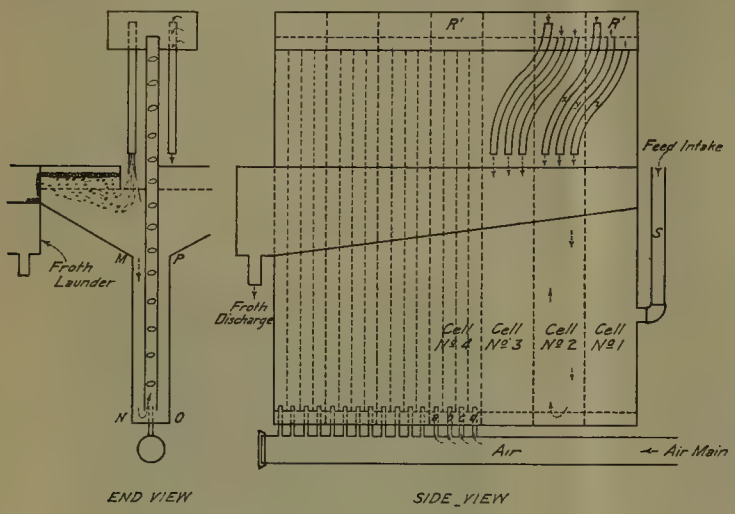

FIG. 3

situated in a trench, and several of these machines could be placed side by side, giving a large capacity per square foot of floor-space. A head of four or five feet of water can be obtained easily, which gives considerable force to the jet of pulp, and produces good agitation and aeration.

MINING COMPANIES using motor-trucks in cold weather are often bothered with water freezing in radiators. A careful study into anti-freezing compounds by the U. S. Bureau of Standards leads to the conclusions that (1) calcium chloride compounds should be used with caution, if at all, on account of their corrosive action; (2) kerosene or similar oils should not be used on account of their inflammability, high boiling-point, and effect on rubber; (3) mixtures of glycerin and alcohol can be used, but the price of glycerin and the need for it in the manufacture of munitions at the present time should preclude its use; (4) solutions made from either wood alcohol or denatured alcohol seem at the present time to be the most desirable anti-freezing solutions to use. If the wood alcohol is free from acid, there is little choice between the two alcohols. Wood alcohol costs more than denatured alcohol and is more volatile, but its lower freezing-point allows a less amount to be used, which may counteract the above disadvantage. The ideal anti-freezing compound is one that will prevent freezing of the radiator liquid without injuring either engine or radiator, that will not lose its non-freezing properties after continued use, and that does not materially change the boiling-point of water when dissolved in it.

Ribbon Zinc as a Substitute for Brass

Before the Government fixed the price of copper and when that metal was selling as high as 34c. per pound, endeavors were being made by those whose prosperity depended on marketing alloys of copper and zinc or copper and tin to find substitutes. About this time a company put on the market a substitute for sheet brass called ribbon zinc, and it was given a trial. In spinning shallow canopies, say about 2 in. deep and about 4 in. diameter, it is fully equal to brass. When attempts are made to spin it to a depth of 4 in. it will not stand annealing, but cracks. This also occurs in shallower shells if spun into a small diameter making a pronounced neck. Considerable of this metal has been used in spinning rings for holding glass dishes, or bowls for close ceiling lights, and fixtures which are suspended by chains. These are all diameters from 8 in. upward, but do not run much over 2 in. deep. In the manufacture of hall and vestibule lanterns, which is hand-work exclusively, ribbon zinc has proved an excellent substitute for brass. After being laid out and cut, the parts are soldered with the same ease, and the completed frame is as firm as in the case of sheet brass. In the manufacture of lighting fixtures the new metal has proved successful. It takes a heavy copper plate, after which it is possible to apply any oxidized finish, whether it be a Japanese bronze or an antique brass. If a white finish be desired the enamel can be applied direct. Other manufacturers are finding uses for ribbon zinc and it will probably develop a field for the consumption of zinc after the War as well as at the present time.

CRYSTALLINE GRAPHITE for making crucibles should contain as high as 85% of graphitic carbon and should be free from mica, pyrite, and iron oxide, which are particularly harmful impurities. It should also preferably contain a large proportion of flakes one millimetre or more in diameter, so that its fragments may interlock and thus be more easily bound together by the clay with which it is to be mixed. Most makers of crucibles prefer to use a mixture of Ceylon graphite with American flake graphite, as the former is more nearly free from impurities and its more nearly cubical fragments have a much smaller surface area in proportion to their volume than the thin flakes of the domestic graphite, so that it requires the use of less clay as a binder. Domestic flake graphite may be used alone for making crucibles.

FLUX for welding high-speed steel to other steel or iron, consisting of 40% bicarbonate of soda, 40% carbonate of soda, 10% sodium borate, 5% precipitated silica, and 5% lithium carbonate was recently granted patent No. 1,256,420, to A. F. Beaulieu, of Chicago.

Making Ferro-Manganese in California

A natural development for the Pacific Coast is that of electro-metallurgy. In California, particularly, there are ores suitable for reduction and water-power available for electric energy, much of it as yet undeveloped. The use of electric furnaces in this State is not new, three having been operated in Shasta county by the Noble Electric Steel Co. for several years. There is a fair demand in the West for alloy metals, but in the East the demand is enormous.

A new company to take advantage of these favorable conditions is the Pacific Electro Metals Co. Its plant is at Bay Point, 30 miles east of San Francisco, on the bay. It is easily accessible, having three railroads close-by, also water transportation. The company is now operating a 40-ton silico-manganese furnace, and will in the near future have a furnace making ferro-manganese. Each of these furnaces has a capacity of 3000 kw. In addition, three 300-kw. furnaces are being erected; in which ferro-nickel, ferro-molybdenum, ferro-chrome, and ferro-tungsten will be made as the raw materials are available. The main buildings are of reinforced concrete. The main furnace building is 120 ft. long and 50 ft. wide. The transformer-building is adjacent to this and is also of concrete. The necessary cooling and packing rooms for the alloys, as well as machine-shop, store-room, wash-house, office, laboratory, and gate-house are all placed in close proximity to the furnace building. The electric furnace in which silico-manganese is made is a three-phase furnace with an open top. The raw materials are fed by shovel around the electrode, and the metal is drawn from a tap-hole at the bottom of the furnace. The operation of smelting is continuous. The electrodes are of 24-in. diameter. The load-factor of an electric furnace should always be good, and the power-factor, owing to the careful interlacing of the leads, is also high. The transformer equipment for one furnace is composed of four single-phase 1000-kw. transformers, one of which is a spare.

To make the plant self-contained and non-dependent on outside sources for electrodes, a plant has been erected and local raw materials are utilized. This building is also of concrete, holding the necessary baking-kiln and apparatus for making electrodes. The directors of the company are C. D. Clarke, San Francisco, president; J. M. Kroyer of Stockton, vice-president; Henry Koster, San Francisco, treasurer; and C. F. Potter and J. W. Beckman of San Francisco. Western capital exclusively is represented in this undertaking. The plant was designed by the Beckman & Linden Engineering Corporation of San Francisco, consulting engineers to the Pacific Electro Metals Company.

PHOTOGRAPH SHOWING LEADS, ELECTRODE, AND ORE OF SILICO-MANGANESE FURNACE, BAY POINT, CALIFORNIA

SILICO-MANGANESE FURNACE IN OPERATION AT BAY POINT, CALIFORNIA

A TOTAL computed lumber-cut for the United States in 1917 of 35,831,239,000 ft. is announced by the Forest Service. This is based on reports received up to May 15 from 16,408 sawmills out of the 24,815 believed to have operated last year. It is estimated that the actual cut in 1917, on the basis of compiled figures, was 10% less than the production in 1916. The falling-off during the past year is attributed principally to largely decreased private building operations, the scarcity of labor in connection with small operations, transportation difficulties, curtailment of demand on the part of wood-using industries, and a more or less general dislocation of lumber distribution through ordinary channels of trade. A considerable portion of the total quantity produced was utilized in meeting the exceptional demands for Government construction and other war emergency projects, including ship material. The State of Washington was again the largest producer, with a cut of 4,570,000,000 ft., Louisiana was second with 4,210,000,000, and Oregon third with 2,585,000,000 ft., crowding into fourth position Mississippi with a cut of 2,425,000,000 feet.

MICA to the extent of 1,216,816 lb. was marketed in this country last year. Sheet mica has become an important war-material, especially in condensers, magnetos, and spark-plugs, in the windows of gas-masks, and for windows in armored cars, and the conning towers of warships and submarines. The prices rose nearly 20% over those obtaining in 1916, the quotations ranging from 18c. per square inch for pieces 2 by 3 in., down to 9.4c. in pieces measuring 8 by 10 inches.

The Price of Mining Explosives

In his annual address to shareholders of De Beers Consolidated Mines (diamond producer), the chairman of directors, Capt. Francis Oats, made sundry interesting remarks on the price of explosives and their effect on mining in the Union of South Africa. Before quoting him we may mention that the De Beers group of mines, at Kimberley, in South Africa, is the greatest producer of diamonds, the output in 1913, the year before the War, being 2,293,000 carats, worth $30,400,000 from 8,695,000 loads (1600 lb. each). This company controls the Cape Explosive Works which in 1917 produced 437,158 cases of dynamite. He said:

Thanks to the Cape Explosives Works, which, as you know, are entirely owned by De Beers company, the mines of South Africa have been kept regularly supplied with dynamite, etc., since the commencement of the War, and at prices which I am justified in saying will bear favorable comparison with those charged at the different centres of consumption where our explosives do compete, and much more so where they are not allowed to compete. One may without hesitation say that were it not for the existence of our factory, mining operations in South Africa would today be seriously curtailed, an event that would be greatly detrimental, firstly, to the thousands of artisans and other workers employed in and affected by the mining industry; and, secondly, to the revenue of the State. I dread to think of the prices that would have been demanded from consumers of this indispensable mining requisite if they had been left to the tender mercy of those who controlled the production and distribution of explosives before the advent of our factory at Somerset West. Let me put before you a few interesting facts: Prior to 1899, the price paid in the Transvaal for blasting gelatine to Nobels (who had the monopoly) had reached as high as £5 7s. 6d. ($25.80) per case (50 lb.). When the Transvaal was subsequently proclaimed a British colony, the Nobel monopoly was cancelled, with the result that in 1901 the prices dropped to 87s.6d. ($21) per case, and in 1902, when our works were nearing completion and the shadow of the Somerset West factory was already hovering over the horizon of the then existing monopoly, it declined to 67s.6d. ($16.20) per case. As soon as the Cape Explosives factory entered the field in 1903, our price worked out at 58s.9d. ($14.10) per case, delivered in Johannesburg, and in subsequent years the prices were as follows: In 1906, 53s. ($12.72) per case; in 1907, 48s. ($11.52); in 1908, 46s. ($11.04); and in 1911, 45s.6d. ($10.92). At or about that figure the price remained until 1913, when it rose temporarily to 48s.9d. ($11.70), and then it gradually descended until in June 1916—nearly two years after the commencement of the War—it stood at 45s.9d. ($10.98). Since then the price has slightly risen, owing to the high cost of raw materials due to the War.

The price paid in Bulawayo [Rhodesia] had in 1901-'02 reached as high as 80s.3d. ($19.26) per case, but at the end of 1903, when the Cape Explosives Works came into competition, the figure dropped to 69s. ($16.56); and in 1907 it was 60s. ($14.40); in 1908-'10 it was 49s.3d. ($11.82); in 1911-'12, 47s.6d. ($11.40); in 1913, 50s.6d. ($12.12); and on June 30, 1916, the price was 47s.6d. ($11.40) per case. It has slightly risen of late for the same reason as applies to the increased prices in other markets.

At Kimberley, before De Beers manufactured its own dynamite, there were two classes of explosives used in the mines, which were supplied by the Trust, and the respective prices were 65s. ($15.60) and 57s.6d. ($13.80) per case. In 1903 De Beers manufactured their 40% 'ligdyn,' which was sold on delivery at 33s.6d. ($8.04) per case. The price gradually dropped until in June 1916 it stood at 28s. ($6.72) per case delivered.

From 1903-'07 the price charged at Melbourne, Australia, was 75s. ($18) per case, and during the latter year it fell to 70s. ($16.80), and continued at that level until the end of 1908. When our company came into the Australian market early in 1909, the price dropped to 54s.6d. ($13.08) per case delivered, and in June 1916 it had fallen further to 52s.3d. ($12.54).

At Broken Hill, New South Wales, in 1905, the price was 51s.6d. ($12.36) per case, rising to 67s.6d. ($16.20) in 1908; but on the entry of our company into competition in 1909, the price immediately dropped to 59s. ($14.16) per case, and on June 30, 1916, our price was 56s.9d. ($13.62) per case, delivered. John Darling, chairman of the Broken Hill Proprietary Co., in a speech to the shareholders of that company on February 25, 1910, said, with reference to the introduction of the Somerset West Works explosives into the Australian markets: 'It is computed that the saving to the mining companies in Australia from this competition amounts to no less than £125,000 ($600,000) per annum.'

In April 1917 the price of the Giant Powder Co. at San Francisco for blasting gelatine stood at 100s. ($24) per case, while our cost for the 10 months July 1916 to April 1917 was 42s.10d. ($10.28) per case, and our provisional price to the Johannesburg mining companies was 43s.6d. ($10.44) per case.

I wonder what the world would be paying for explosives today were it not for the competing influence of the De Beers Explosives Works. . . . Roughly speaking, the explosives used in South Africa for mining purposes are today half the price they were before we commenced the erection of our large works at Somerset West. Prices charged for explosives in Cornwall, England, are much in excess of those at our factory, notwithstanding the fact that wages are much higher in this country (Africa) and that we have to pay heavy freights on the raw materials. To show the contrast in the figures I will give you the following examples: In February last 50% gelignite was 60s. ($14.40) per case in Cornwall, and our price free on truck at Firgrove was 30s. ($7.20); 75% gelignite in Cornwall was 70s. ($16.80) per case, against 38s.3d. ($9.18) at our factory, while gelatine was 77s.6d. ($18.60) per case in Cornwall, compared with 43s.6d. ($10.44) at Somerset West.

Cyanidation at San Juancito, Honduras

During 1917 the New York & Honduras Rosario Mining Co. treated 125,900 tons of ore. This assayed 15.026 oz. of silver and 0.1165 oz. of gold per ton, equal to $9.84. The extraction of silver was 88.31%, and of gold 94%. The cost of treatment was $2.61 per ton. The 20 stamps weigh 1850 lb. each. The average time of treatment was as follows:

	Hours
Batteries to high agitation-vats (in weak solution)	4.0
In high agitation-vats (in strong solution)	40.2
High agitation-vats to filter-presses	12.5
Total period	56.7

Chemicals used were 2.463 lb. of sodium cyanide, 0.917 lb. of zinc-dust (on 18,650 tons), 0.306 lb. of aluminum-dust (on 107,250 tons), 1.912 lb. of soda-ash, 0.009 lb. of lead acetate, and 17.878 lb. of lime per ton.

The increasing cost and scarcity of cyanide made it

TREATMENT PLANT AT SAN JUANCITO, HONDURAS

imperative that a means be found whereby less of this chemical be used, at the same time not decreasing the extraction. The substitution of aluminum-dust for zinc-dust as a precipitant seemed to solve the difficulty, as it is well known that under certain conditions a good deal of cyanide is regenerated when aluminum is used. In 1916 laboratory experiments were under way, and although these did not prove entirely satisfactory, precipitation by aluminum-dust, in place of zinc-dust, was nevertheless definitely adopted on a working-scale in February 1917. In spite of some discouraging features at the outset, one of which at first affected extraction somewhat adversely, while another prevented a contemplated increase in the rate of milling, it is pleasing to state that aluminum precipitation has proved a most important economic success.

In comparing the cyanide consumption since the aluminum process was adopted with that of the year 1915, when zinc was used entirely, an average saving of 1.215 lb. per ton of ore is shown. As 107,250 tons of ore has been treated under the new process, 130,309 lb. of cyanide has therefore been conserved.

Using the latest cost of cyanide, aluminum, zinc, and soda-ash as a basis, there is a saving of 38 centavos (17.5 cents) per ton, and as the decrease of lime consumption from 29.7 lb. per ton in 1916 (when zinc-dust was used) to 17.9 lb. per ton in 1917, is almost entirely attributable to the adoption of aluminum precipitation, a further saving of 20 centavos (9.2 cents) per ton has been effected, which in all makes a total saving of 58 centavos (26.7 cents) per ton.

At the present time improvement in two directions presents itself in connection with the aluminum process. The first is a saving in aluminum-dust; the second the further prevention of incrustation by calcium aluminate in the mill-piping. Hopes of success in solving each of these problems are entertained, and they will have full attention during the current year.

Melting the precipitate into doré bullion continues to be the practice. Since aluminum precipitation was adopted more fluxing materials are necessary, but the bullion produced is consistently finer, therefore the extra cost for flux is somewhat offset. As precipitates by aluminum weigh considerably less than an equal volume produced by zinc, it is now even more advantageous to do the melting in Honduras instead of shipping the precipitate, in spite of increased cost in materials.

PROPERTIES OF ELECTROLYTIC COPPER. Previously published values for the modulus of elasticity having varied so much, tests were made by E. Melbourn ('Jour. Brit. Inst. Elec. Eng.') to determine it for stranded cables under actual working conditions. An experimental span of about 150 ft. was set up with specially reinforced terminal blocks. The wires used were 7 strand, 0.025 sq. in. total area; 7 strand, 0.05 sq. in.; 19 strand, 0.10 sq. in.; and 37 strand, 0.25 sq. in., bare copper cables. The tests were made under the same conditions, namely: 1. The points of suspension were leveled with a theodolite. 2. The span-lengths were pulled up to about 6 in. dip, just under one-half the breaking-stress and allowed to stand two hours. 3. The strand was then let out to about 12 in., about one-fifth the breaking-stress, and the dip, d_1, at the centre of the span, measured. 4. The span-length was then loaded with an extra length of the same size strand, and the new dip, d, measured. This was equivalent to loading the strand with its own weight of ice, distributed over its length. 5. The measurements were made in still air, and at the same temperature. 6. On removing the extra length of strand under (4), the original strand returned to dip d_1 under (3), thus showing no slipping and no strain beyond the limit of proportionality. Still's formula $(W_1/d_1) - (W/d) = 65(d_1^2 - d^2)\,MA/3^{14}$ was used. From the modulus, M, in millions of pounds per square inch was calculated for the different cables; $M = 20.11$ for the 7 strands, 0.025 sq. in cable; 19.85 for 7 strand, 0.05 sq. in. cable; 17.36 for the 19 strand, 0.10 sq. in. cable; and 15.46 for the 37 strand, 0.25 sq. in. cable. From these figures the value of M for a 61-strand conductor would be 14,000,000, and for the 91 strand conductor, 12,500,000. These tests confirm those made by W. B. Woodhouse for values under working conditions.

Concentrates

A METAL is an element that forms a base by combining with an hydroxyl group or groups.

DANGER SIGNALS should always be put in dangerous places, and be left there as long as the danger exists, but as soon as the danger is removed the sign must be removed.

COSTS of mining companies in South America are considerably affected by the rate of exchange. In 1917, the Chile Copper Co.'s labor charges were increased nearly one cent per pound of copper thereby.

RADIO-ACTIVE ORES accelerate the rate of discharge of electricity from a charged body, because the rays they give off ionize the atmosphere surrounding the charged body. Hence an electroscope can measure radio-activity.

QUICKSILVER contained in silver metallics of the Kerr Lake mine at Cobalt has averaged 1% per ton of silver, or 20 lb. from 2000 lb. This is recovered by a condenser-tube fixed to the air-tight cover on the crucible melting-furnace.

FLOTATION RESULTS at the Burro Mountain copper mines of Phelps-Dodge Corporation show that marked improvement is not to be expected by variations of reagents, but rather by prolonged or slower treatment. This ore contains 1.97% copper.

PURE NICKEL does not rust or oxidize; neither will the metal tarnish like silver or some of the alloys, such as german silver (copper, nickel, zinc). Nickel is practically immune from attacks by alkalies, and is largely resistant to the action of most acids.

BURRED AND DEFECTIVE HAND TOOLS are one of the most common causes of minor accidents. Foremen and men should see that such tools are removed from service, and put in good order. Burrs should be dressed off all hammers and steel, and only 'good order' tools should be used.

OIL IN SHALE is considered by some engineers not indigenous to the shale from which it can be distilled, but was formed elsewhere and then migrated to the shale, where it became adsorbed and inspissated, so that it cannot be extracted by solvents of petroleum, but must be obtained by destructive distillation.

WATER has been a great expense to the Old Dominion Co. at Globe, Arizona. As much as 11,500,000 gal. has been pumped in a day. In 1917 the maximum flow was 4,898,393 gal. Pumps installed have a capacity of 20,000,000 gal. daily. It was found in 1916 that below Pinal creek there was an area of exceedingly broken and porous ground near the mine, that probably let in water from the creek. During 1917, a total of 2015 ft. of holes was drilled in the creek-bed, and 23,000 tons of mill slime run into the ground through the holes. When the wet season commences the results of this grouting will be shown.

SEEMINGLY EMPTY GASOLINE CANS or tanks are probably more dangerous than those filled with gasoline. Usually the can is not entirely emptied, the remaining gasoline will vaporize, the vapor will mix with the air in the can, and the mixture may easily be explosive. When the can is being filled, this mixture is forced out by the gasoline and may explode if ignited by a flame or spark near the opening.

LITHIUM compounds find several important uses; for example, lithium hydroxide is a constituent of the electrolyte of the Edison storage-battery, and other lithium salts are used in pharmaceutical preparations. Metallic lithium, a silver-white soft metal, is the lightest of the alkali metals—so light that it will float on water. Lithium colors a flame deep red, and has been used in fireworks and signal-rockets, and is otherwise of military use.

THIS SIMPLE TEST FOR CASSITERITE, given by F. L. Hess, of the U. S. Geological Survey, should be useful in prospecting: Place a fragment of the mineral in dilute hydrochloric or sulphuric acid with granulated, shot, or sheet-zinc. The zinc and the acid rapidly evolve hydrogen, which takes the oxygen from the mineral, leaving a coating of tin on the fragment tested. Granulated zinc is the best to use, as its small particles can be made to touch the specimens at many points, thus bringing more of the hydrogen into contact with the molecules of tin-oxide. The reaction is

$$4H + SnO_2 = Sn + 2H_2O$$

The metallic coating has a dull gray, somewhat leaden appearance, but it may be made lustrous by rubbing with a soft cloth or with the hand. If the hand is used, the characteristic odor given off when tin is rubbed on the flesh may be noted.

TIME in mixing concrete in machines is usually guessed at by the man in charge. In addition to this, he has the following duties: observe the motive power in a general way, raise and lower the skip without striking careless workmen, supply the proper amount of water for the mixture, and, finally, operate the bucket in placing the concrete. In addition to all of these he is expected to guess to a few seconds the time concrete is in the dump. An automatic device, consisting of a small gear-wheel that is worked by the main gear on the machine, a train of small gears, and a gong, has been tried successfully. This batchmeter not only relieves the operator of guessing, but the man in charge knows by the bell that the materials have been sufficiently mixed. One of the most unusual features of this device is the effect produced by the ringing of the bell. It seems to affect the whole organization in that the men in front of the mixer speed-up to receive the coming batch; also the men behind the mixer are awakened to the fact that their material should be in the skip in the next few seconds, to prevent delay.

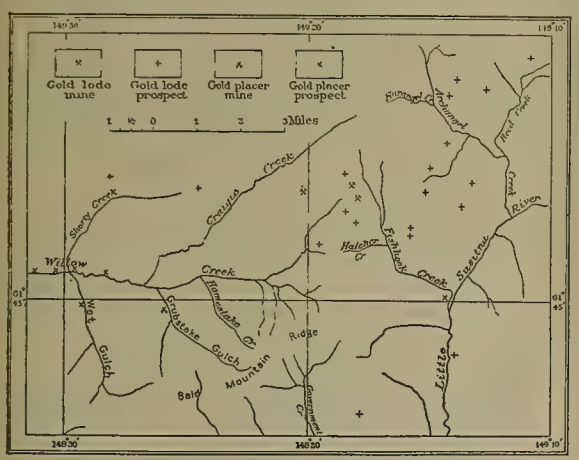
REVIEW OF MINING

ANCHORAGE, ALASKA

Railroad Construction.—Willow Creek Notes.

The $7,000,000 requested by the Alaskan Engineering Commission for the year's work for continuing the construction of the Government railroad was cut to $5,250,000 by the House Committee on Appropriations. One million dollars for development of Matanuska coal for the Navy has also passed the House. Both of the bills are awaiting confirmation by the Senate. Work on the Government railroad is progressing as rapidly as men can be obtained. Day and night shifts are working on the Turnagain Arm division. The Dredge 'Sperm' is digging a channel to the site of the proposed dock.

Doheny & Thompson of Montreal, operating the Gold



PART OF WILLOW CREEK DISTRICT, ALASKA, SHOWING SITUATION OF PROPERTIES (U. S. G. S.)

Bullion mine under the name of Willow Creek Mines, had a small crew doing development during the past winter, and began milling ore on May 29. A new penstock has been built—giving 14 ft. additional head—and a new turbine installed, which is expected to operate to better advantage under conditions of water scarcity than the former system, also to prolong the milling season, generally lasting 120 to 140 days from June 1. The mill is equipped with 12 stamps and 2 Wilfley tables, and has a capacity of 50 tons in 24 hours. A cone classifier divides the tailing into 70% sand and 30% slime. The former goes to tanks and the slime is impounded at present. The sand-leaching plant has a capacity of 45 tons per day; 35 tons coming from the mill and 10 tons from old material. This plant also treats concentrate from the Wilfleys. The company is to install a Dorr continuous-decantation plant to treat slime at an early date. The mine workings are at an altitude of 4500 ft., and the mill 3000 ft. An aerial tram one mile long conveys ore from mine to mill. A. T. Budd is manager and N. D. Bothwell superintendent. Seventy men will be employed.

William Martin, of Seattle, largely interested in the Willow Creek district, will operate the Mabel and Independence mines this year, in addition to the Alaska Free Gold.

The Talkeetna Mining Co.'s property, on Archangel creek, is under lease and bond to W. R. Hocking of Seattle, who is now on the ground with men.

The Willow Creek Development Co., Charles Herron, president; Judge David, treasurer; T. Bedell, secretary, will do development on the Isaacs group on Reid creek, which is under bond to the company.

L. R. Rinker, of Loveland, Colorado, representing people from that district in the New Mabel Mining, Milling & Power Co., is in the Willow Creek district. His company has a bond on the Arch group and will do development this summer.

The LeRoi Mines Co. has been organized to develop prospects on Archangel creek in the Willow Creek district. George Carrol is president; Ben Levin, treasurer; R. M. Courtnay, secretary; and J. R. Austin, general manager. The capital is $300,000, par value $1.

BRECKENRIDGE, COLORADO

Placer and Deep Mining Operations.

Dredging continues unabated in this district. No. 1 boat of the Tonopah Placers Co. and a boat of the Powder River Gold Dredging Co. are operating in the old channel of the Blue river, a little over two miles north of Breckenridge. The gold secured is generally round, the nuggets are scarcer than in the Swan river and French gulch. No. 2 boat of the former company is doing well on leased ground of the Farncomb Hill Gold Dredging Co. in the Swan valley. Its No. 3 boat and one of the French Gulch Dredging Co. are doing well in French gulch. The Tonopah Placers during the season of 1917 dug 3,351,821 cu. yd. of ground in the beds of three streams producing $451,743 at a cost of 7.6 cents per yard.

The Royal Tiger company is operating the old I. X. L. in Swan valley, under the management of T. A. Brown. A new mill, something out of the ordinary, provides for the sorting of lumps of high-grade ore before pulp reaches the jigs. The vein, 50 ft. between walls, carries lead and bismuth. If present methods prove satisfactory, a 300 or 400-ton plant will be erected.

Re-timbering of the Cleveland tunnel of the Mattie B. Mining Co. has been completed. It passed through an 80-ft. fault, and recovered the vein. The tunnel cut copper ore 300 ft. from the portal. Drifts show it to be 18 to 30 ft. thick. The ore carries gold, silver, and copper. J. A. Hazen is manager.

Paul Burdette is still working his lease on the vein that he followed from the Ella workings into ground owned by the Wellington Mines Co. and makes semi-monthly shipments of lead carbonate ore in carloads.

The 20-stamp amalgamating and concentrating mill of the Big Jesse property has for some time been operated satisfactorily on good ore. George F. Roth, of Rochester, New York, lately became manager.

Ray Meyers, William Sauers, and others are to drive a drift from the Puzzle Extension lode in Illinois gulch to cut the two veins of the Washington property, 200 ft. below the level of the present Washington workings.

The orebody of the Monte Cristo is of blanket type, and appears to be from 4 to 7 ft. thick, carrying gold, silver, iron, and zinc. The re-modeled mill of the Monte Cristo has been in commission for some time, handling ore of the Liberty Leasing & Milling Co., of which Frank Peabody is manager.

The Gold Bond Extension Co. is working claims on Mt. Guyot. The principal vein is 4 ft. wide, containing a 2-ft. pay-streak. The ore is said to be worth from $50 to $100 per ton in silver. Monthly shipments during the summer will be made from 50 to 75 tons.

Ellwood & Wiseland recently shipped a carload of good-grade silver-lead ore from the Pilot in the Montezuma district. One vein of the Pilot contains arsenic, some of which is in the form of long crystals.

The tunnel of Crown Point, one of the old Union Group on Mineral hill, has been put into good repair by G. Calvert Smith.

PLATTEVILLE, WISCONSIN

Zinc, Lead, and Pyrite Mining and Markets.

Mine operators in the first half of June were apprehensive over the possible shut-downs because of low prices for zinc ore, poor demand, and a rapidly increasing surplus of concentrate; but were greatly relieved in the second half by better prices. On high-grade refinery blende, used in sheet and plate mills, the allocated base price of $75 per ton, 60% metal, prevailed; but the quantity diverted to this branch of the spelter industry was comparatively light, less than 10 cars weekly. On second and inferior grades the range was $45 to $60 per ton, 60% assays, down to $42.50 to $50, with a rather indifferent demand for ore prevailing the better part of the month. Low grades were entirely undesirable in the first two weeks. Independent producers selling in the open market contented themselves with restricted output and storing in bin, until about mid-month the reserve in the field of all grades was in excess of 12,000 tons. It was this stock that inspired buyers with the belief that ore could be had in quantity at their own offers, but a rapid rise in the price of spelter changed the situation completely, and prices of concentrate moved with the gain in the price of the metal. Several mines in the field that had suspended production resumed work, and began recruiting working forces to their former strength, a rather difficult undertaking at present.

Lead producers had nothing to worry them. The month opened at $85 per ton, 80% metal content. Later in June offerings were as high as $97.50 on choice lead concentrate, and some lots in excess of 80% had been bid in at over $100 per ton. The reserve held at the beginning of the month, over 2000 tons, was considerably increased, fine weather enabling many miners to invade old diggings and shallow surface workings from which was culled fair-grade lead ore thrown upon the waste-piles many years ago. Producers holding in quantity were not tempted to sell much, even when top prices were offered. Producers were sanguine that the price would advance over $100 per ton. Most of the lead ore that reached rail was sold to the Federal Lead Co., which for years has employed a system of paying for it as soon as weights are certified. This method is liked by producers, and much competition in bidding for lead ore is through this procedure eliminated.

The demand for iron pyrite continues. The output is about 800 tons weekly, nearly all of which comes from the zinc-ore refineries in the field. A new sulphuric-acid plant is to be constructed at the National Zinc Ore Separating Works at Cuba City. It will be able to treat 200 tons of crude concentrate daily and make 100 tons of commercial acid daily. The acid department will be under the direction of W. N. Smith, of the Vinegar Hill Zinc mines, general manager of this company's producers in both the Missouri and Wisconsin fields.

Deliveries during June to local refineries and to smelters out of the field were 16,005 tons of blende, 715 tons of lead, and 1992 tons of pyrite.

COBALT AND PORCUPINE, ONTARIO

New Mining Districts.—Condition of Gold Mining.

Cobalt.—Some of the large Cobalt mining companies, which are looking for new prospects to develop, are investigating properties in the south-eastern portion of Bucke township, three miles north of Cobalt. This area may prove to be an important extension of the Cobalt field. A contact-zone occurring on the shore of Lake Temiskaming is stated to extend for several miles in a north-westerly direction through Bucke. It is characterized by considerable faulting, and some promising veins have been discovered. The Mining Corporation of Canada has taken an option on 80 acres in north Cobalt, and is said to be negotiating for other properties. Several other deals are pending. Good results from the re-opening of the old Green Meehan mine, which is now yielding high-grade ore, have helped to stimulate interest in this area.

The Kenabeck Consolidated Silver Mines, of which high expectations were entertained at the outset, has gone into liquidation. E. Champagne has been appointed liquidator.

The Trethewey company of Cobalt has decided to continue the shaft on the Castle property at Gowganda, being developed to the 350-ft. level.

Porcupine.—All expectations of an early resumption of ore treatment at the Dome mill have been abandoned, as the company is disposing of its milling supplies, chemicals, etc., valued at $300,000. This condition will apply until the return of more favorable economic conditions.

The Vipond-North Thompson is being closed indefinitely, and underground operations are being curtailed.

The Newray mill has been overhauled and is again in operation.

The Dome Lake has cut a third shoot on the 500-ft. level, showing 6 ft. of good ore. A winze will be sunk 100 ft. on this. The mill is extracting 90% of the gold.

At the Davidson the shaft will be deepened to 700 ft. A transmission-line is being constructed from South Porcupine to supply power, and a larger plant will be installed. David Sloan has been appointed manager.

Promising gold discoveries are reported to have been made in the Teddy Bear River district, and a number of prospectors have gone in. The Teddy Bear flows into Lake Abitibi, and is seven miles west of the Ontario-Quebec boundary. The formation is stated to be similar to that of the Lightning River district, of which it is presumably a continuation.

LEADVILLE, COLORADO

Two Mines Shut-Down Permanently

As mentioned in the Mining Summary of July 13, the shutting-down of the Leadville unit of the U. S. S. R. & E. Co. is a big loss to this district, as apart from the monthly payroll of $8000, great things were expected from the exploitation of the old workings.

All the known orebodies in the Tucson mine of the Iron Silver Mining Co. have been extracted, no new ones have been found, so it is to be closed. Salvage of underground equipment is now in progress. The Tucson was for years one of the most productive mines in the district, shipping zinc-lead sulphide ore. The Mikado shaft ground, acquired two years ago, is yielding 250 tons of zinc ore daily, but this output is to be increased.

Activity in the manganese properties continues.

THE MINING SUMMARY

ALASKA

Juneau.—Alaska Gold Mines in June milled 82,600 tons of $1.25 ore, recovering 83.31%. Tonnages since the beginning of the year are as follows:

Month	Tons	Value per ton
January	179,300	$0.903
February	140,305	0.934
March	150,093	1.114
April	125,435	1.148
May	101,200	1.114
June	82,600	1.250

For some reason shares recently jumped from $1.25 to $3.50, but have eased off to $2.50.

Kasaan.—The shaft at the Granby Consolidated's It mine has been sunk 275 ft., and stations are being cut at the 85, 170, and 255-ft. levels. Diamond-drilling has been started and each level will be prospected. From 225 to 255 ft. the shaft was all in ore, and looks promising.

Ketchikan.—A 100-ton mill, employing gravity and flotation methods of concentration, is working at the Saltchuck property of J. E. Chilberg of Seattle, 60 miles north of this place. The first shipment assayed 44% copper, 2 oz. gold, 14 oz. silver, also some platinum.

ARKANSAS

Batesville.—The Chanute Spelter Co. is re-opening a manganese mine near here, idle for 30 years. E. W. Buskett has a deposit assaying 45% Mn and 2½% Fe. A. Miser, of the U. S. Geological Survey, is completing an investigation of manganese in this State.

ARIZONA

All copper producers have advanced wages by 50c. per day, effective July 1. Men in the Miami district now get $5.65 per shift.

Ajo.—New Cornelia is to start at an early date excavating for a 500-ton experimental flotation plant to treat its sulphide ore. The machinery has been ordered. In June the output of copper was 2,821,676 lb. of cathodes, 935,807 lb. of cement metal, and 443,280 lb. in sulphide ore smelted, a total of 4,200,763 pounds.

Bisbee.—The Phelps-Dodge Corporation has made a change in its bonus system and started an arrangement whereby each man in its employ for one year shall receive an additional bonus for each year of service up to a maximum of $250, when no additional bonus will be paid. The main points are as follows: After July 1, 1918, every employee who has remained in the service of the company continuously for one year will receive a bonus of $100 upon completion of his year's service, and for each additional year of continuous service an additional $10 will be paid until the annual bonus amounts to $250, when no further increase will be made in the annual bonus. The bonus is in no way related to the wage-rate, or kind of work done. It is a flat bonus for continuous service and the same amount will be paid to every employee, regardless of his daily wage, monthly salary, or nationality. In order to receive the bonus employees must remain continuously with the company, but time lost on account of sickness or accident will not count against them after they return to work. They will be allowed to lay-off for a total of 30 days during any year's service period, provided written permission is obtained.

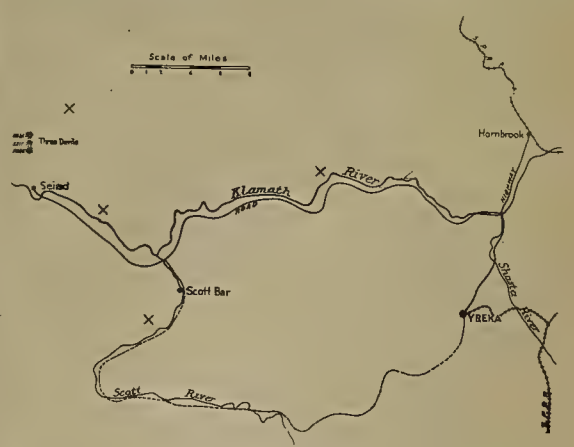
Jerome.—The United Verde Extension has blown-in its first furnace.

Johnson.—The Arizona United Mining Co., owner of the Republic and Mammoth mines, in Cochise county, states that it has terminated the lease made three years ago to the Goodrich Lockhart Co., operating as Cobriza Mines Development Corporation, and has resumed possession and operation of its properties. Heretofore operations conducted by lessees were limited to mining and shipping high-grade direct-smelting ore. The company will enlarge operations and, in addition to continuing the shipping of rich ore, proposes to develop lower grades. During the period of operations by lessees, shipments were made of 6500 tons per month of 5% copper ore.

CALIFORNIA

Carrville.—The Yukon Gold Co. has stopped its dredge on the Trinity river, and will dismantle it. About three years ago the boat was erected in Morrison gulch, near Carrville, at large expense. The ground was found to be unpayable, so the boat was moved three miles down the river. Here, large boulders have interfered with operations and made recovery of the gold difficult. The report of this company for 1917 makes little mention of any difficulties.

Yreka.—To assist in mining chrome in Siskiyou county, estimated by assistants of Albert Burch of the U. S. Bureau



PART OF SISKIYOU COUNTY, CALIFORNIA, SHOWING ROAD TO BE IMPROVED ALONG THE KLAMATH RIVER TO AID MINING OF CHROME. THE DOTTED ROAD WAS PROPOSED, BUT GRADES ARE HEAVY.

of Mines to be 30,000 tons, the Federal government has appropriated $5000 to $10,000 to aid in improving the road from the junction of Little Shasta river with the Klamath river, down the latter to Seiad about 50 miles. Siskiyou county is also to expend $10,000 on the road, producers will pay 4 cents per ton-mile for the chrome hauled over it, and as back-loading the auto-trucks will carry material to

be used in maintenance. From Little Shasta river to Hornbrook on the Southern Pacific, this is part of the State highway from Yreka, which is finished. The haul to Hornbrook is easier than to Yreka.

Copperopolis.—The Napoleon Mining Co., operating at Telegraph City, 7 miles west of here, has erected precipitating boxes, 450 ft. long, to recover copper from rich mine-water. The mine is 500 ft. deep, but is only unwatered to 200 ft. A new hoist has also been put in, also two Diesel engines to drive an Allis-Chalmers ball-mill, two concentrators, and an M. S. flotation unit, to dress 90 tons of ore daily. The new plant is expected to be ready by September. David Coughanour is superintendent of this mine, which has a past output of $1,200,000 in copper and gold.

Sacramento.—In the 'Press' of July 13 it was stated that in the dispute between William Hales and others and the Central Pacific Railway Co., and the Power Timber Co., assignee, the Land Office had decided that miners may file mineral claims to railroad lands in California found to contain chrome. The vital point in the decision was that the suit involved unpatented railroad lands. Locations cannot be made on patented railroad lands. This suit was started a year ago. The locations were the four claims called the Iowa Hill Chrome Ore Mines in Placer county. The defendant contended that the ore was an iron ore. A sample from all the claims averaged 45.38% Cr_2O_3 and 11.6% Fe. The chrome deposits were adjudged to be valuable, but the iron content was worthless.

San Francisco.—Reports filed with the State Mining Bureau during the week ended July 6 show five new wells starting to drill, making a total of 411 since the first of the year. There were 597 wells reported for the same period of 1917.

COLORADO

Climax.—According to H. L. Brown, consulting engineer for the Climax Molybdenum Co., the mill is to be enlarged from 500 to 1000-ton capacity. The present monthly output is 100 tons of MoS_2 concentrate, and some difficulty has been experienced in marketing it. To move miners from one level to another it is said that Otis elevators are to be used. This mine is worked through tunnels.

Cripple Creek.—The Portland company pays 2 cents per share on July 25.

Silverton.—The D. L. & W. Co., operating the Lackawanna, shipped 30 cars of ore to the Silver Lake mill during May and is steadily increasing its output.

The S. D. & G. Leasing Co., operating the Silver Lake Mines, is not shipping much ore at present.

The Ranchman Mines Co., holding a number of claims in this district, has been incorporated with a capital of $250,000. The officers are T. J. Downing, J. E. Burger, F. W. Sharp, S. R. Carney, and J. E. Burgess.

Indications for the present season's output of Silverton show that it may exceed that of 1917.

Telluride.—The Tomboy Gold Mines Co. paid a dividend of 12c. per share on June 28. This is equal to $37,200. In a circular issued from London on March 19, it was explained that the reduced profit was due to labor conditions, making it impossible to draw on the better ore in the higher levels of the mine. A circular of June 8, just to hand, states that the general manager, D. A. Herron, estimates general expenses for 1918 to be $74,000 per month, plus war taxes of $5000. Average monthly expenses in 1914, 1915, 1916, and 1917, were $50,000, $59,000, $64,000, and $69,000, respectively. To maintain the past monthly profit of $30,000 under present conditions would be forcing the mine to yield twice the profit earned in 1914, which cannot be done. Until conditions are better, the profit will therefore be $10,000 per month.

IDAHO

Mullan.—The Federal M. & S. Co. earned a profit of $134,874 in May. Losses were made in the first two months of the year.

Work at the National copper mine was not suspended as reported, but men are now stoping ore above the 1400-ft. level. A winze is to be sunk on ore below 1500 feet.

Wallace.—All mine employees in the Coeur d'Alene region —about 4000—have been granted a raise of 50c. per day, effective July 10. The wage will now be $5.25.

MONTANA

Butte.—All of the companies here advanced wages 50c. per day on July 4, making the average $5.75. A total of 21,725 people will benefit, receiving $2,750,000 per month. A wage increase conference was held in the office of C. F. Kelley, vice-president of the Anaconda company. Others attending were: W. A. Clark, representing the Clark interests; Charles Bocking, assistant manager of the Butte & Superior; Norman Braly, general manager of the North Butte; Oscar Rohn, general manager of the East Butte; William L. Creden, general manager of the Davis-Daly; Paul A. Gow, general manager of the Tuolumne; Al Frank, general manager of the Bullwhacker and Mines Operating Co., and a number of Anaconda officials.

The following is a table of the number of men employed by the companies operating in the Butte district, according to the 'Butte Miner':

Company	Men
Anaconda:	
Mines at Butte	10,200
Office at Butte	500
Washoe works at Anaconda, including office force of 150, and Southern Cross mine	3,600
Works at Great Falls, including office force of 50	1,850
Total Anaconda	16,150
Butte & Superior	1,600
North Butte	1,400
East Butte	950
W. A. Clark interests:	
Elm Orlu mine	500
Timber Butte mill	250
Ancient mine	20
Travona mine	30
Moulton mine	20
Butte Reduction tailing	10
Total Clark	850
Davis-Daly	400
Tuolumne	65
Butte & Ramsdell	40
Butte-Bullwhacker	35
Butte-Duluth Mines Operating Co	30
Butte-Detroit Copper & Zinc	15
Great Butte	10
Office men from all mining companies, excepting Anaconda	200
Total number Butte, Anaconda, and Great Falls employees	21,725
Total Butte (exclusive of lessees)	16,275
Total Anaconda	3,600
Total Great Falls	1,850

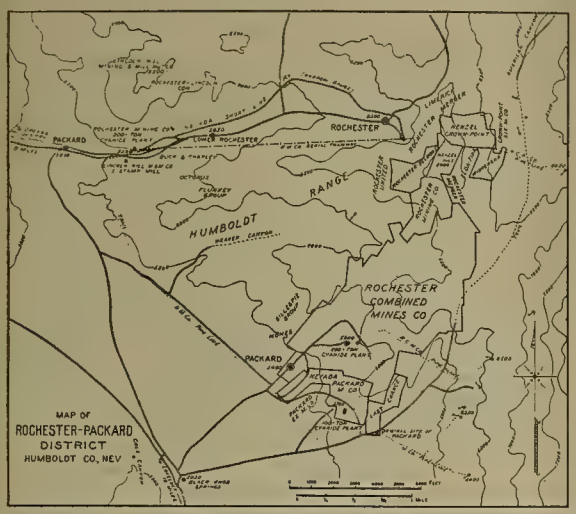
Mr. Kelley stated that the advance in copper to 26c. per pound serves only to give miners and other employees of the companies increased wages, and to enable the mining interests to meet the additional freight rate, which, in the case of the Anaconda company alone means an extra expense of $3,000,000 per year. Therefore one cent of the 2½c. higher price for copper goes to the railroads, and another cent to the increase of wages. The present wage contracts with all organized crafts will continue until July 1919. This increase is voluntary and does not abrogate these contracts. When the price of copper was fixed by the Government at 23½c., a stipulation was entered into with the Government that wages would not be reduced. As the then current price was about 26½c. this fixed the wage scale at 25c. per day above the contract schedule. The increase in wages now given establishes a scale that under the contracts with employees would only prevail when copper sold

between 29 and 31c., and increases the differential to 50c. per day above the contract schedule. The net result of the increased price, therefore, so far as the Butte district is concerned, is to distribute the bulk of it at once to the railroads and employees. Notwithstanding this fact, all of the operators expressed themselves as willing to meet the situation, and are pleased that the Government has enabled them to provide for the increased freight charges and to make a substantial increase in the wage-scale.

Phillipsburg.—Timbering in the shaft of the Jackknife manganese mine collapsed at a depth of 60 ft. on July 9, entombing seven miners under 40 tons of debris. Seventy men formed a rescue-corps and released the men late the next day. Food and water was given them through pipes.

NEVADA

Rochester.—The Nevada Packard Mines Co. has issued its report for the year ended June 1, 1918. The general superintendent is H. G. Thomson; mine superintendent, C. L. Holmlin; assayer and chemist, Waterfield Painter; and accountant, R. E. Adams. Earnings totaled $235,910, of



which $48,373 was profit. Current assets amount to $49,272, and liabilities $24,188. Development covered 2659 ft. This resulted in opening three important orebodies. A shaft is being sunk in the sheared zone along the contact-fault. This has cost $31 per foot. At 96 ft. a 4-ft. formation of sericite-schist was cut, assaying $4 per ton. The opening of a large lens of residual primary ore, the first sulphide ore in the property, was an important development. No estimates of reserves is possible, owing to the peculiarity of the ore. The mill treated 31,390 tons of $8.63 ore, extracting 88.5%. This yielded 250,387 oz. of silver and 357 oz. of gold. Mining cost $1.342; milling, $2.029; development, $1.521; and marketing bullion 11.1 cents, a total of $5.003 per ton. In 1916-'17 extraction was 86.8%, yielding 339,062 oz. of silver and 617 oz. of gold, and total costs $5.42 per ton. Merrillite was substituted for Japanese zinc-dust for precipitation, ending all troubles in that department. Cyanide on hand amounts to 19 tons, equal to 15 months' supply. The report for May 1918 shows an extraction of 91.5%, the highest since October 1916. All costs were 5 cents per ton lower than in April.

The Rochester Combined Mines Co.'s 300-ton mill is ready to start. This was designed by K. Freitag. There is said to be 200,000 tons of $12 silver-gold ore in reserve.

Round Mountain.—With a population of only 200, and 63 miles from rail, this place has subscribed $24.94 per head to the War Savings Stamps drive. To the Three Liberty Loans they subscribed $92,900, and to the Red Cross $1238. Altogether the per capita subscriptions to the War is $496.54. The Round Mountain Mining Co. is the principal operator here.

Tonopah.—Miners in the Victor shaft of the Tonopah Extension downed tools on July 9, demanding $7 per shift instead of $6, on account of their special skill. The company refuses to acquiesce, considering the demand as unfair.

OKLAHOMA

Douthat.—A 500-ton (in 10 hours) plant is being erected by J. J. McLellan and Ray Munson to dress tailing at one of the Admiralty Zinc Co.'s dumps. Assays show up to 5% zinc and lead. Equipment includes four sets of rolls, two rougher-jigs, one chat rougher or sand jig, one 7-cell cleaner-jig, 10 sludge-tables, and a flotation plant.

Picher.—Production of the mines last week was 3386 tons of blende and 595 tons of lead, worth $264,297.

A 250-ton mill is being erected for the Miami Wonder company. Rich ore has been opened at a depth of 208 ft. A. V. Ellis is superintendent.

The Jefferson Mining Co. has purchased machinery for a 300-ton mill to be erected near here. At a depth of 230 ft. there is a 12-ft. face of rich ore. A. B. Clark of St. Louis is president.

OREGON

Jacksonville.—The Blue Ledge, Copper King, and several properties in the Blue Ledge district are producing copper ore running over 12%. The wagon haul to Jacksonville costs $10 per ton. The yield this season from the district is expected to be considerable. It is reported that flotation plants will be erected at several of these properties.

UTAH

Dividends paid by Utah companies in the first half of 1918 totaled $9,306,570, compared with $15,242,845 in this period of 1917. The list is as follows:

	Per share	Total		Per share	Total
Bingham Mines	$1.50	$143,000	Ontario	$0.50	$75,000
Chief Con.	0.20	176,840	Pacific	0.01	4,000
Daly	0.20	30,000	Silver King Con.	0.10	70,000
Dragon Con.	0.02	37,500	Tintic Standard	0.09	105,730
Eagle & Blue Bell	0.20	180,000	Utah Con.	0.50	150,000
Grand Central	0.05	30,000	Utah Copper	5.00	8,122,500
Iron Blossom	0.02½	25,000	Western Utah	0.07½	37,000
Judge	0.25	120,000			

Bingham.—The Utah Copper Co. has raised the wages of 4500 men 50c. per day, effective July 1.

Garfield.—The A. S. & R. Co. has raised wages at this and its Murray smelter 50c. per shift; 2500 men benefit thereby.

Salt Lake City.—Ore producers and smelters in this State may quarrel over the increased rates and penalties being or to be levied by the smelters. A Federal mediator may be asked to investigate.

Tintic.—This district produced 200,000 tons of ore, worth $6,000,000, during the first half of 1918. In the same period of 1917 the output was about 240,000 tons. There are 40 mines shipping at present, led by the Dragon, Chief, Iron Blossom, Eagle & Blue Bell, Tintic Standard, Centennial, Grand Central, Mammoth, Colorado, Gemini, Gold Chain, and Victoria.

The Chief Consolidated company recently acquired 125 acres of land, formerly embraced by the North Godiva property. For this, $50,000 was paid. The Chief now owns about 859 miles in this district. Another large working shaft is to be sunk on the Crusader claim, a half-mile east of the present main shaft. It will be sunk to 2000 ft., and will be 17 ft. 4 in. by 6 ft. 2 in., with three compartments. Walter Fitch, Inc., will do this work. A hoist from one of

the other shafts will be used to 600 ft., after which a large one, on order, will be used.

The Chief Consolidated M. Co. almost finished putting in its electric pumps of 2000-g.p.m. capacity. Water from the lower levels will be raised to 1800 ft., then to 1200 ft., 600 ft., and the surface. The water-column is 8 in. diameter. Some of the water is to be used for fire protection.

CANADA

British Columbia

Trail.—An increase of wages has been demanded by employees of the Consolidated M. & S. Co. at several of its mines. In most instances the miners have accepted the company's offer of substituting the Rossland mines scale in the lead mines, which means an increase of approximately 15c. per day. Some, however, have refused this proposal. At the Sullivan mine, at Kimberley, an increase of 50c. was asked, which would give muckers $4.15 and miners $4.65 per day.

Three Forks.—During its past financial year the Rambler-Cariboo Mines received $78,785 from sales of lead and zinc ore and concentrate. A dividend absorbed $17,500. The balance is $20,832, about $1000 less than the previous one. There was mined 9500 tons, yielding 580,990 lb. of lead, 163,576 lb. of zinc, and 78,529 oz. of silver. The superintendent, W. A. Cameron, is hopeful about the mine, which has sufficient ore for two years' operation of the mill.

Ontario

Cobalt.—Silver output of the Kerr Lake mine in May was 268,213 oz., a record. There are 55 men employed.

Porcupine.—The Schumacher gold mine is to be closed until conditions are more favorable. Labor is scarce and supplies not only high in price, but some are most difficult to obtain.

The Teck-Hughes Gold Mines company has decided to close its property until conditions improve. The directors fully considered 'selective mining,' that is, extracting and milling the best ore, but after consulting expert advice they concluded that this would not be in the best interests of the company. Cash resources are small and not sufficient to carry on development for many weeks.

Port Colborne.—The International Nickel Co.'s new refinery here commenced operations last week.

Yukon

Dawson.—Hydraulicking on Last Chance creek started on about May 17. The Yukon Gold Co.'s plants on Bonanza were expected to commence soon after.

MEXICO

Chihuahua

Santa Eulalia.—The Buena Tierra Mining Co. has issued its reports for 1917. Political conditions in this State made it impossible to operate during the period, but as the A. S. & R. Co. was to re-start its smelter at Chihuahua in April of 1918, the management prepared to re-open the mine. Ore-reserves remain at 281,500 tons of lead ore, and the physical condition of workings and plant is good. Expenses in Mexico last year totaled $16,721. A. C. Brinker is general manager, and R. M. Raymond consulting engineer.

Applications for fellowships in the College of Mines, Seattle, University of Washington, and the Pacific Northwest Experiment Station, U. S. Bureau of Mines, will be received during the summer, the time for filing having been extended in order to meet the changes in personal plans incident to war service. Each fellowship has a value of $60 per month. Holders become candidates for the degree of master of science in mining engineering or metallurgy. Graduates in science as well as technology may apply.

PERSONAL

Note. The Editor invites members of the profession to send particulars of their work and appointments. This information is interesting to our readers.

J. M. Callow is at Ray, Arizona.

C. O. Lindberg, of Los Angeles, is here.

John A. Rice is at Bully Hill, California.

Albert Burch has gone to Butte, Montana.

Gerard Lovell has arrived in London from Australia.

B. H. Dosenbach, of Butte, has been here on a short visit.

Frederick Bradshaw, of Tonopah, spent a few days in San Francisco.

J. M. Manson, of the Western Ore Purchasing Co., Hazen, Nevada, is here.

L. F. S. Holland has returned to Los Angeles from Boulder, Colorado.

Richard Snell has returned from the Butters Divisadero mines in Costa Rica.

James S. Wroth has been appointed First Lieutenant in the Engineer Officers Reserve.

D. H. Angus has resigned as manager of the Tough-Oakes mine at Kirkland Lake, Ontario.

Henry J. Russell, of Denver, president of the U. S. Rare Minerals Co., was here last week.

A. R. Globe, for several years assistant manager of the Hollinger at Porcupine, has resigned.

C. M. Eye, of Baguio, Philippine Islands, has been to Tientsin, Peking, and Tsingtau, China.

Chauncey L. Berrien, formerly at Anaconda, has been promoted to Major in the Aviation Service.

D. A. Mutch has been appointed manager of the Coniagas company's Ankerite mine at Cobalt, Ontario.

F. W. Bradley is making his periodical visit of inspection to the Treadwell and Juneau mines in Alaska.

H. Hardy Smith, recently at the Suan mine, in Korea, is now with the Huchang Mining Co., in the same region.

Robert E. Tally, mine superintendent for the United Verde Copper Co., at Jerome, Arizona, is at the St. Francis hotel.

Francis C. Lincoln, professor of mining and metallurgy in the University of Nevada, is now at Long Beach, California.

L. J. Mayreis has resigned the position of assistant resident manager of the Burma Mines Ltd. He left for New York in June.

Byron E. Janes, graduate mining engineer from the University of California, was killed at the El Tigre mine, Sonora, Mexico, on July 10.

D. C. Livingstone, representing the Idaho School of Mines, is on the north fork of the Coeur d'Alene river making an investigation of rare metals.

Seeley W. Mudd has been promoted to Colonel in the Engineer Officers Reserve Corps. He is on the New Hampshire coast convalescing from a recent illness.

Theodore Pilger, formerly with the Butte & Superior Mining Co. as mining engineer and geologist, has established an office as consulting engineer at Archangel, Alaska.

Elder Nance has just returned from the Orsk goldfield in Siberia. Conditions there have not been affected much by the War, save that labor is scarce and money transactions are difficult.

G. A. Roush, assistant professor of metallurgy in Lehigh University, and editor of 'The Mineral Industry,' has been appointed Supervisor of Training for the Inspection Division of the Ordnance Department.

THE METAL MARKET

METAL PRICES

San Francisco, July 16

Aluminum-dust, large and small lots, cents per lb	65—70
Antimony (wholesale), cents per pound	15
Copper, electrolytic, cents per pound, in carload lots	26.00
Copper, electrolytic, cents per pound, in small quantities	27.30
Lead, pig, cents per pound	8.30— 9.30
Platinum, Government price, per ounce	$105
Quicksilver, per flask of 75 lb	$120
Spelter, cents per pound	11
Zinc-dust, cents per pound	17½

ORE PRICES

July 16

Antimony, 45% metal, f.o.b. California, per unit	$1.10
Chrome, 38 to 48%, California, per unit	$1.25—$1.50
Magnesite, crude, California, per ton (nominal price)	$7.00—$8.00
Manganese, domestic, 35 to 54%, f.o.b. South Chicago, per unit (Government price, effective May 29)	$0.86—$1.30
Manganese, domestic, 35 to 54%, f.o.b. east of South Chicago, per unit (Government price, effective May 29)	$1.01—$1.45
(Manganese, domestic, penalty of 50c. to $1 per ton for 8% and up to 25% silica, and bonus of 50c. to $1 for less than 8 and 5%.)	
Molybdenite, per lb., 90% MoS_2	$1.25
Pyrite, per unit of sulphur, cents	28
Tungsten, 60% WO_3, California, per unit	$20—$24

Aluminum and bauxite in 1917 has just been issued by the U. S. Geological Survey. In the chapter is a list of consumers of the ore bauxite.

'Chromite,' a 30-page pamphlet by Albert Burch and S. H. Dolbear, is now ready, and may be secured free upon request.

The restriction on the import of graphite has been extended by the War Trade Board, effective for all 1918. Investigation shows that stocks and domestic production will suffice for requirements well into 1919.

The War Trade Board has amended the restriction on the importation of manganese to permit its importation, under the back-haul proviso, permitting its importation when shipped as return cargo from Europe and the Mediterranean coast of Africa, and when shipped from convenient ports where loading can be done without delay. Importations of manganese ore from the Far East have, by another ruling, been prohibited as to ocean shipments made on and after July 20, 1918; and, to make this ruling effective, all outside licenses for the importation of manganese from those countries have been revoked as to ocean shipment on and after July 20. Adequate supplies can be obtained, it has been found, from sources nearby, entailing far less strain upon present shipping resources.

EASTERN METAL MARKET

(By wire from New York)

July 16.—Copper is quiet. Lead is scarce and strong. Spelter is dull, though steady.

COPPER

On September 21, 1917, the Government fixed copper prices at 23.50c. per lb. for large lots, and 24.67½c. for small lots, effective until June 1, 1918. On this date the prices were re-fixed until August 15; but on July 2 the price was increased to 26c. and 27.30c., respectively, until August 15. Quotations in cents per pound are as under:

Iron Cap	850,000	Utah	18,500,000

SILVER

Below are given official (not Government) quotations, in cents per ounce of silver 999 fine. In order to make prompt settlements with smelters and brokers, producers allow a discount from the Government price of $1, hence the lower price. The Government has not fixed the general market price at $1, but will pay this price (as from April 23, 1918) for all silver purchased by it. The equivalent of dollar silver (1000 fine) in British currency is 46.65 pence per ounce (925 fine), calculated at the current rate of exchange.

Silver dollars representing $64,000,000 have been melted and silver certificates of $58,000,000 destroyed, to the first week in July.

A conference of all assayers in charge of the United States Assay Offices will be held at Carson, Nevada, in September, to discuss the provisions of the Silver Purchase bill, according to announcement made by Raymond T. Baker, director of the Mints. He says that there are many points to be considered under the Bill, and it is necessary to establish uniform rules for carrying out its provisions in all parts of the country; hence the conference. Mr. Baker will preside at the meeting and a number of other important questions in connection with the handling of the country's silver will be discussed.

LEAD

Lead is quoted in cents per pound, New York delivery. Government metal receives 7c. per lb. until August 6. Early in July producers agreed to fix prices at 7.90c. per lb., New York, plus the extra freight.

ZINC

Zinc is quoted as spelter, standard Western brands, New York delivery, in cents per pound. On May 25, 1918, the Government fixed prices until September for grade A spelter at 12c. per lb. for itself and the open market. Lower grades can make their own prices as usual. Sheet-zinc is fixed at 15c., and plate at 14c. per pound.

QUICKSILVER

The primary market for quicksilver is San Francisco, California being the largest producer. The price is fixed in the open market, according to quantity. The Government is taking 40% of the United States quicksilver output, paying therefor $105 per flask. Outside of this business the competitive market can make any price as usual. Prices, in dollars per flask of 75 pounds:

Eastern Metal Market

New York, July 10.

None of the markets is particularly active; all are fairly strong.

The 2½c. advance in the price of copper gives general satisfaction.

Tin is very quiet and without feature.

Lead is strong and inactive with the New York price advanced 15 points.

Zinc is quite inactive again but firm in price.

Antimony is unchanged and dull.

Disagreement on all the products considered was the outcome of the conference in Washington, July 3, between steel-makers and a special price-fixing committee. The makers of rails were at odds as between $57 and $60, the former satisfactory to the large interests. The Government proposed a much lower price. A meeting of steel-makers alone in New York on July 15 will attempt an agreement. The steel industry as a whole continues to make an unexpectedly good response to the call for war steel, aided particularly by cool weather. There are also indications of a better morale among the workers at iron and steel plants, stimulated by the zeal of the ship-workers. The large new locomotive plant at Chicago for the Baldwin Locomotive Works has taken shape in the inquiry before fabricators for 10,000 tons of material.

COPPER

As already indicated, in a late addition to the report of last week, the Government maximum price of copper was advanced 2½c. per lb. to 26c., as a result of the Washington meeting on July 2. It is now stated that this was to become effective on that day and to continue until August 15. The President is understood to have promulgated the new schedule officially. Not only was the increase a surprise, coming as suddenly as it did, but the extent of it was more than had been expected, no more than 25c. having been spoken of generally. The fact that the matter came up so suddenly and that it was moved forward for consideration from August 7 to July 2, leads to the conclusion that the Government had facts before it warranting the decision made. What these actually were, and what went on behind the scenes, is not publicly known. A representative of a large producer and seller told your correspondent today in substance what follows: Probably the new freight rates precipitated the matter, adding as they do to the cost of producing copper in many ways. Besides this, since the 23.50c. price was fixed last September, there have been advances in wages by many companies, and more are to come. The question of a proper or an increased recompense to refiners because of higher costs was another factor. The new increase will probably be absorbed largely by the higher costs so that low-cost companies will really be no better off than when 23.50c. price and lower freights prevailed. The possibility was mentioned that the new level would ensure the small producer a fair profit so as to keep them operating and thus make sure their needed output of about 100,000,000 lb. per year. That the present production is not as large as may be required, since the demand and consumption are increasing rather than otherwise, may have been a factor also in the deliberation. There is talk of a 27c. price after August 15, and it is stated that there is to be a meeting on August 7 to consider the basis to be established after August 15. The jobbing price is now 27.30c. per lb. in 5-ton lots or less, or 5% over the car-load price. It is almost self-evident that a much better feeling prevails in the industry. There is a good deal of confusion as to just how the new price affects copper already sold, but no definite understanding has been heard.

TIN

Practically no business has been done in the last week, and the market is quite bare of news or developments. Occasional lots, for future shipment from the Far East, have been sold, but they have been in small quantity and of no particular significance market-wise. They went at about 86 to 86.50c. per lb. There is nothing more heard about price-fixing, and there is no news as to supplies of the metal. There have been more arrivals of Banca tin at Pacific ports. Buyers are not endeavoring to purchase, knowing that there is little use in pushing matters. Arrivals at Atlantic ports up to July 8 inclusive had been 445 tons, with 1325 tons reported as having come in at Pacific ports. There is no estimate published as to the quantity afloat. The London market has advanced lately, and is now at £345 per ton for spot Straits as against £332 10s. a week ago.

LEAD

The new freight rates continue to cause confusion and changes in the market. Due to an adjustment on account of this, the lead producers have advanced the New York price to 8.05c., or 15 points above that of last week, with no change in the St. Louis price, which still stands at 7.75c. per lb. In this connection it is interesting to note that before the 25% increase in freight rates was authorized, the rate from St. Louis to New York was 19½c. per 100 lb. It is now 35c., with that from Omaha 27c. per 100 lb. The new New York price is therefore an average between these, or 30 points above the St. Louis price as a base. As to the market in general, it is the same old story—very quiet but very firm. There is undoubtedly a scarcity and producers are well sold up. Everybody is trying to prevent the market going to premiums by keeping it at quoted prices, so as to forestall Government-fixed levels.

ZINC

The market has become dead and devoid of interest after the late advance and the fairly large buying, especially by the Government. There has not been enough buying to really test the market. It may be quoted nominally at 8.85c., New York, or 8.60c. per lb., St. Louis, for prime Western for July or early delivery, with a slight premium for August and September. One large dealer quotes 8.55 to 8.62½c., St. Louis, for all of the third quarter, but reports no business. There is very little desire to buy or sell.

Grade A zinc is fixed at a maximum price of 12c. per lb. Sheet-zinc is regulated at a 15c. per lb. maximum with plate-zinc at 14c. per pound.

ANTIMONY

The market is quiet at 13 to 13.25c., New York, duty paid, for prompt and early delivery. There have been a few sales of 25-ton and smaller lots.

ALUMINUM

Government maximum prices continue for No. 1 virgin metal, 98 to 99% pure and for scrap, at 33c. per lb. for lots of 50 tons and over, at 33.10c. per lb. for 15 to 50-ton lots and at 33.20c. per lb. for lots of 1 to 15 tons.

MOLYBDENUM

The market is nominal at $1.25 per lb. of MoS_2 in 90% concentrate. It is stated that most of the Canadian molybdenite has been contracted for shipment abroad.

Mining Decisions

"Mineral" Defined Judicially

The term "mineral," when employed in conveyancing, is understood to include every inorganic substance which can be extracted from the earth for profit, whether it be solid, as stone, fire-clay, the various metals and coal, or liquid, as for example salt and other mineral waters and petroleum oil, or gaseous, unless there are words qualifying or limiting its meaning, or unless from the deed, read and construed as a whole, it appears that the intention was to give the word a more limited application.

Horse Creek Land & Mining Co. v. Midkiff (West Virginia), 95 South-Eastern, 26.

Coal Lands—Disqualified Holder May Transfer

One disqualified from holding title to coal lands could receive a title from the lawful owner thereof and transfer it to another who is legally qualified to hold it—in other words, could act as an intermediary for conveyances.

Ketchum Coal Co. v. Pleasant Valley Coal Co. (Utah), 168 Pacific, 86.

Oil and Gas Lease—Rights of Lessee Prior to Discovery

The lessor under an oil and gas lease is the only person who can take advantage of a provision in a lease providing for a forfeiture thereof for failure of lessees to comply with its terms. While the lessees acquire no vested estate in the premises prior to the discovery of oil or gas, yet they have the right to the possession of the land to the extent reasonably necessary to perform the obligations imposed upon them by the terms of the lease.

Brennan v. Hunter (Oklahoma), 172 Pacific, 49. April 9, 1918.

Coal Lands—Excessive Entries—Cancellation

In determining the validity of patents to coal lands, where it appeared that the entries were all made in pursuance of a scheme by an association of persons to obtain more land than allowed by law, the validity of any one or more of the several patents cannot be determined apart from the general scheme.

United States v. Kirk (Colorado), 248 Federal, 30.

Oil Lease—"Net Proceeds" Defined

Where an oil lease indicated that net profits were to be determined by deducting from the gross income only the royalty and operating expenses as distinguished from capital expenses, the words "net proceeds," as used in a modifying clause, providing that after the first four years at least half of a certain 15% of the net proceeds derived from the business should be paid to the plaintiff, meant net profits as above defined.

Nathan v. Porter (California), 172 Pacific, 170.

Oil and Gas Lease—Royalties—Forfeiture Waived

Where an oil and gas lease provided that royalties should be deposited to the credit of the lessor in a specified bank, the lessor constitutes the bank as his agent and if the bank accepts the lessees check for royalties several days after they are due under the lease, the lessor is bound by the acceptance and cannot forfeit the lease for non-payment within the stipulated time.

Beatty Oil & Gas Co. v. Blanton (Kentucky), 245 Federal 979.

Book Reviews

Accounting: Theory and Practice. A first-year text by R. B. Kester. Pp. 607, index. The Ronald Press Co., New York, 1918. For sale by 'Mining and Scientific Press.' Price, $2.50.

Looking at this subject from the standpoint of a mining company, we would say that this book will be found useful. During the course of a year we study and abstract from the balance-sheets of several hundred companies, whose accounting is based on the fundamentals discussed in the new work. The author says that this is an effort to supply a field rather barren of text-books for students of first-year accounting. Most students entering college do not have a knowledge of bookkeeping, while in some schools a knowledge of such is a prerequisite to entrance on the study of accounting. Between bookkeeping and accounting there seems to be no difference; it means the same thing. We consider that this volume is more than a first-year text, that is, it will do admirably for such a purpose, also for those experienced in the profession of accountancy.

A Handbook of Briquetting. By G. Franke. Translated by Fred. C. A. H. Lantsberry. Pp. 631, 9 plates, 225 ill., index. J. B. Lippincott Co., Philadelphia, 1917. For sale by 'Mining and Scientific Press.' Price, $5.

This book is Vol. I of a handbook originally written by Professor Franke of the Bergakadamie of Berlin. The work is intended not only as a text for instruction but as a practical guide for actual briquetting of coals and other fuels. The second volume will follow shortly and it is complete in itself, and either volume will be sold separately. It is the most exhaustive treatise on the subject probably to be found in the language, and will be of great value to engineers engaged in conservation problems, which are becoming more and more urgent. The historical account is interesting, but the larger value lies in chapters dealing with crushing, mixing, warming, drying, kneading, and heating coals, together with the binding materials used in briquetting, followed by an elaborate discussion of all the forms of presses in common use before the War. A large number of briquetting factories are described in detail, aided by working plans. The estimates of cost have only a relative value, but the comparison of economies obtained will apply, with altered figures, at the present time. The application of briquettes both for domestic use and industrial operations is discussed in great detail. The treatise on briquetting of coal is followed by chapters on briquetting of waste coke, waste brown coal, peat, sawdust, waste wood, and other organic materials. A brief discussion is also given to briquetting as applied to inorganic non-metallic materials, and the briquetting of salts. The book should attract a great deal of attention from engineers at the present time.

Fuel Economy in the Operation of Hand-Fired Power-Plants. Circular No. 7 of the University of Illinois Engineering Experiment Station. Urbana, April 1918.

There are two possible results of the probable fuel shortage next winter; either certain industries must close down or more work must be done with the coal available. This 90-page booklet, printed in four colors, shows that the average small power-plant can save 15% of its fuel by the exercise of greater care in equipment and operation. This means a saving of 12 or 13 million tons per annum if applied throughout the country. Important considerations are the coal, principles of firing, boilers and stacks, feed-water, steam piping, and record of operations.

Company Reports

PHELPS-DODGE CORPORATION

Properties: mines and works at Bisbee, Douglas, Morenci, Prescott, and Tombstone, Arizona; at Dawson and Tyrone, New Mexico; and at Nacozari, Sonora, Mexico.

Operating Officials: at Copper Queen Branch: G. H. Dowell, manager; Gerald Sherman, superintendent of mines; and H. H. Stout, superintendent of reduction works. At Morenci Branch (Detroit): M. H. McLean, manager; V. P. Hastings, smelter superintendent. At Burro Mountain Branch: E. M. Sawyer, manager. At Copper Basin Branch: A. B. Peach, acting superintendent. At Stag Cañon Branch: T. H. O'Brien, manager; J. B. Morrow, superintendent of coke works. At Moctezuma Copper Co.: J. S. Williams Jr., general manager. At Bunker Hill Mines Co.: E. Grebe, superintendent. At Phelps-Dodge Mercantile Co. (Bisbee): W. H. Brophy, general manager; W. A. Meyer, acting.

Financial Statement: sales of copper, lead, silver, gold, coal, coke, and merchandise totaled $61,161,459. Investments, etc., yielded $1,100,727. The total was $62,262,186. Operations cost $32,053,619; taxes, $5,857,595; depreciation and general, $1,894,065. The profit was $22,456,906, plus $15,687,126 brought forward from 1916, making $38,143,032 available. After paying dividends there was a balance of $27,343,032.

Dividends: four of $2.50, and extras of $14, amounted to $10,800,000. The total now (May 1918) is over $70,000,000.

Production: labor troubles curtailed operations at Bisbee and Morenci, while there was a general shortage of men. The output from all departments was 153,974,692 lb. copper, 8,136,356 lb. lead, 1,524,632 oz. silver, and 24,423 oz. gold. Including metal from toll operations, there was sold 274,994,140 lb. of 'C * Q' electrolytic and 15,528,429 lb. of P. D. ingot copper. The price fluctuated between 33¾ and 23½c. per pound.

Copper Queen Branch

Development: work was restricted by labor conditions, and covered only 58,518 ft., against 80,853 ft. in 1916, in the Limestone mines. The most important result was that in the orebody in the south-west. A system of fire-doors and sprinklers was put in, also the forced ventilation plant was completed. Ore production included 740,090 tons of copper by company operations and 35,986 tons by lessees, 15,476 tons of lead by company and 2571 tons by lessees, and 2379 tons of manganese. Lead ore was sent to El Paso.

At Sacramento Hill there was 290,771 cu. yd. of overburden removed. In the West deposit is 3,407,148 yd., to mine which must be moved 10,383,997 yd. of waste. A 3000-ton mill is to be erected to handle this ore. There were 2264 men employed at the mines.

Smelter: the works at Douglas received from all sources 1,276,817 tons of charge, which yielded 191,581,131 lb. copper, 2,042,263 oz. silver, and 32,331 oz. gold. Improvements permit of a larger capacity. There were 1485 men employed at the works.

On January 7, 1918, service bonuses were paid to 2286 employees, the amount being $181,120.

Morenci Branch

Development: strikes caused a shut-down for almost four months. Ore-reserves were considerably increased. The four mines produced 324,516 tons of mixed ores.

Concentrator: the mill dressed 312,225 tons assaying 2.33% copper, making 46,047 tons of concentrate carrying 11.20%. Tailing averaged 0.648%, giving a recovery of 70.78%. Results are considered disappointing, due to the abnormal conditions. The flotation plant is to be enlarged.

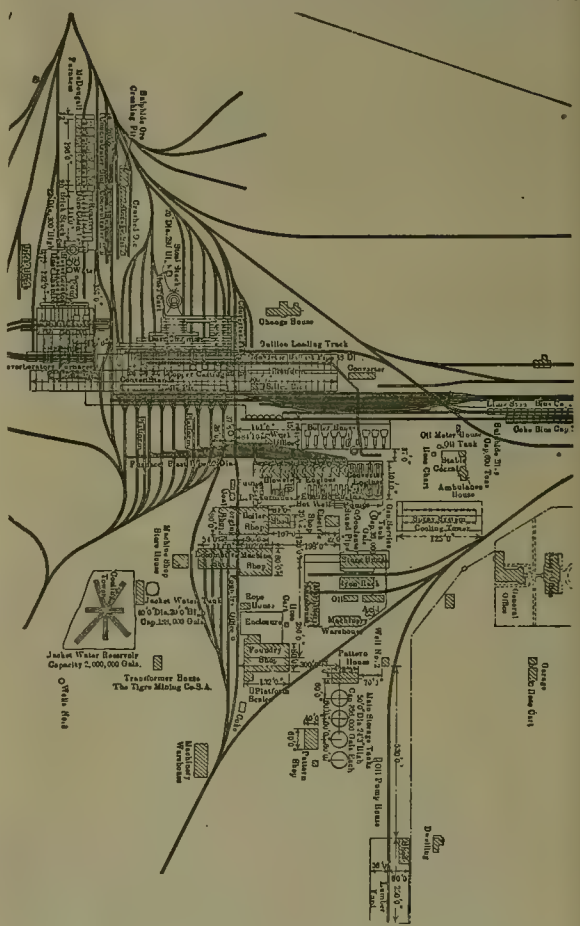
Smelter: the blast-furnace reduced 118,596 tons of charge, yielding 13,203,401 lb. copper. By June 1918 there should be two 1000-hp. Diesel engines in the power-plant. Another is to be ordered also, and one 3700-cu. ft. Diesel air-compressor.

Employment was given to 1192 men.

Burro Mountain Branch

Development: churn-drilling exposed ore at several points. A total of 30,542 ft. was drilled, 52 holes averaging 587 ft. Underground the number of tons opened per foot of development was 37.8, an increase of 16.3 tons. To block out a ton cost 21c., a decrease of 4c. The Thistle and Mohawk deposits are being prepared for extraction and larger tonnage for the mill when it is enlarged. Reserves were substantially increased.

Concentrator: 473,443 tons of 1.972% ore was dressed to 45,681 tons assaying 14.775%. Residue contained 0.606%,



Plan of Copper Queen Smelter, Douglas, Arizona

giving 72.258% recovery. Including lessees ore and precipitates the yield was 14,253,391 lb. copper and 39,404 oz. silver. Experiments are to be made in leaching ore below milling grade.

At the power-plant there were to be four Diesel engines working by May 1918. A Diesel air-compressor was started last November.

There were 928 men employed. Considerable progress was made at the townsite.

Copper Basin Branch

Development: a total of 1250 ft. of work was done. Reserves compare favorably with those of a year ago.

Production: of 17,299 tons shipped, 11,658 went to the

smelter at Clarkdale, 4253 tons to Douglas, and 1388 tons to Humboldt. Copper content was 934,781 lb., returning $166,090.

Stag Canon Branch

Production: coal from the six mines totaled 1,406,079 tons, an increase of 33,825 tons. Of this, 767,601 tons was sold to railroads, and 112,566 tons to other consumers. Washed coal amounting to 489,859 tons made 306,455 tons of coke, a slight increase. There were six fatalities.

Moctezuma Copper Co.

Development: prospecting and exploration totaled 33,823 ft. Reserves increased considerably, mainly below the Porvenir tunnel-level. The new Pilares shaft is to be sunk and equipped to supersede the present one, now in ore. The Churunibabi mine is shipping ore direct to Douglas. Work at La Caridad was greatly retarded. The Promontorio has been discouraging.

Concentrator: 750,897 tons of 3.179% ore produced 156,067 tons of concentrate assaying from 12.284 to 13.141% copper. Tailing contained 0.747%, making a recovery of 81.19%. The flotation plant is to be improved, especially in the slime department.

Bunker Hill Mines Co.

Development: the advance last year was 11,598 ft., but results were not encouraging.

Production: the mine yielded 69,418 tons of various ores, an increase of 10,119 tons. The mill dressed 16,075 tons of gold-silver-lead ore and 28,672 tons of manganese ore. Shipments consisted of 2872 oz. gold, 397,253 oz. silver, 1,049,445 lb. lead, 13,357 lb. copper, 2106 lb. molybdenite, 3355 tons of manganese, and 471 tons of manganese dioxide. Lessees also produced 1763 tons of lead-copper-silver-gold ore.

There were 386 people employed.

Phelps-Dodge Mercantile Co.

Gross sales amounted to $9,789,639, an increase of $1,383,003. The net profit was 8.42%, a drop of 1.96%. During 1917, 34.6% of sales was to company's employees, the remainder to outsiders and the trade. A new store was opened at Tyrone, New Mexico, where sales totaled nearly $1,000,000. There were 620 people employed at the stores and general office, 24% being women.

AURORA CONSOLIDATED MINES CO.

Property: gold mine and mill at Aurora, Mineral county, Nevada; controlled by Goldfield Consolidated Mines Co.

Operating Officials: J. W. Hutchinson, general manager; W. M. Dake Jr., general superintendent.

Financial Statement: sales of bullion in 1917 amounted to $404,558 net, plus $11,153 from sundries. Operations cost $434,499, leaving a loss of $18,787. Interest and depreciation increased the loss to $48,978. This, with previous deficit, made a total deficit of $607,137.

Development: new openings amounted to 3993 ft. Results on the whole were not encouraging. Some prospecting was done in the old Juaniata workings, under water since 1872. At 85 ft. above the main haulage-level the vein was found exposed for 260 ft., half of which had been stoped. It is 8 ft. wide, increasing to 18 ft. on the east. A 90-ft. section assays $4.50 per ton, and one cut for 10 ft., $20 per ton. With the Juaniata Extension claim the company has 5000 ft. along the strike, and the vein may prove of considerable importance. An arrangement was made to work the Silver Lining mine adjoining. An indicated ore-shoot is 250 ft. long, worth $10 per ton, and about 75,000 tons of $8 ore is estimated to be available.

Production: the mill treated 175,447 tons of ore assaying $3.32 per ton, of which 82.15% was extracted.

Costs: these totaled $2.48 per ton, mining being 92.6c., treatment $1.297, and general 26.3 cents.

ROUND MOUNTAIN MINING CO.

Property: gold mine and placer deposits and mill in Nye county, Nevada.

Operating Official: Gibson Berry, general superintendent.

Financial Statement: revenue from gold totaled $225,586. All charges, including $28,910 for depreciation and $22,638 for taxes, etc., were $153,383. The profit was $72,204.

Dividends: none were paid, so the total remains at $363,965.

Development: practically no new work was done, but during four months the mill ran on bulk samples from four separate sections in the mine. These resulted as under, for the three, the other being too poor to finish:

	No. 921	No. 710	No. 473
Ore treated, tons.....	1,422	1,102	1,184
Average value	$3.20	$1.60	$1.27
Extraction, per cent.....	78.5	83.8	76.3

Section 921 contains considerable ore, offering favorable inducements for exploitation under normal conditions. The mill was stopped in September. In the above tests, treatment was varied to determine the best method. Several lessees are working in the mine, also on bedrock of the placer area.

Pipe-lines and other equipment for hydraulicking are in good condition. An earth dam was built in Jett canyon, 8 miles distant. The main tail-race was lengthened 1269 ft., making it 4280 ft. long. Supplies on hand for extensions are ample for some time. Rail liners in the flume are entirely successful, so is blasting the gravel ahead of sluicing.

Production: 12,118 tons of ore averaging $7.21 per ton was milled. The extraction was 89.9%. There was hydraulicked 127,788 cu. yd. of gravel, averaging $1.0956 per yard. Bedrock cleaning yielded $15,353 additional. Total ore milled to date is 411,015 tons, worth $3,091,595.

Costs: mining and milling were $2.176 and $2.183 per ton, respectively. Placer operations cost 37.3c. per yard, labor accounting for 83.5%.

SHATTUCK ARIZONA COPPER CO.

Property: copper-lead mine in Bisbee district, Arizona.

Operating Officials: L. C. Shattuck, general manager; Arthur Houle, superintendent.

Financial Statement: gross income from all sources was $3,652,156, of which $3,609,989 was from metals sold. Operations cost $2,174,656, leaving a profit of $1,477,500. After deducting dividends and depreciation the 1917 surplus was $101,141.

Dividends: four absorbed $612,500, making $6,562,500 to date, equal to $18.75 per share.

Development: new openings amounted to 15,793 ft., down to 900-ft. depth, only 23 ft. being done at this point. Total openings are 127,855 ft. Tunnels 5984 and 5903 showed some silicious manganese. On 100-ft. level the most important development of the year was opened. A lens, 110 ft. long, 25 ft. thick, and 60 ft. wide, assays 30% copper, 12 oz. silver, and $2 gold per ton. Around this ore is a silicious ore assaying 15% lead, 8 oz. silver, and $1.60 gold per ton. Much lead-silver and promising leached copper ore was opened. Old stoping ground on 700-ft. level continues to yield new orebodies of importance. Work at 800 ft. has not opened any commercial ore. Sinking to 1000 ft. was to be done early in 1918.

Production: ore shipped amounted to 130,645 dry tons of copper ore and 6804 tons of special ore. These yielded 11,935,317 lb. copper, 2,010,145 lb. lead, 1542 oz. gold, and 154,344 oz. silver.

Costs: these were $10.01 per ton of ore, and 13.242c. per lb. of copper. A 400-ton mill, using Minerals Separation process, was expected to be working by May 1918.

INDUSTRIAL PROGRESS

INFORMATION FURNISHED BY MANUFACTURERS

SMOOTH-ON CORRUGATED IRON GASKETS

The maintenance of tight connections on flanged-joint pipe-lines is often a source of trouble. Such joints actually seem to delight in leaking at critical times and at inaccessible places. A permanently tight gasket, that when once placed can be forgotten with assurance that it will never cause trouble, should win instant recognition. The Smooth-On corrugated iron gasket is coming into wider use in mines, particularly for high-pressure steam and for air-lines, because it invariably makes a joint that lasts as long

as the pipe itself. Smooth-On gaskets are made from sheets of specially prepared iron, rolled with concentric corrugations, and then coated with Smooth-On elastic iron cement No. 3. It is the peculiar property of this cement to metallize and to expand when metallizing, which makes the Smooth-On gasket permanently leak-proof, since it completely fills the irregularities in the flange-faces. Being of iron throughout, the gasket expands and contracts with the pipe, and so the parmanency of the joint is never impaired. There are many cases on record where after years of service without a leak, Smooth-On gaskets have been removed in dismantling a line and have been found to be uninjured. By again coating with Smooth-On elastic cement No. 3 they were ready for use in a new place. Smooth-On gaskets are made for all sizes of pipe from 2 to 24 in., and for pressures up to 250 lb. Both narrow and full-width gaskets are made in each size. The narrow gaskets cover the surface of the flange-face inside the bolt-line circle and are recommended for general use, and costing less than the full-width gaskets which cover the entire flange-face.

INDUSTRIAL PROGRESS

Manufacturers of many articles have found it expedient to take advantage of the Argentine protective tariff to open branch factories in that republic. The same thing is likely to happen in Chile. The Sociedad de Fomento Fabril, of Santiago, has proposed protective duties on a long list of manufactures. Those that concern the mineral industries are: plows and harrows, galvanized iron pails, bolts and rivets, sheet iron, aluminum and copper kitchenware, structural iron, iron cut nails, wire nails, iron benches, crown tops, automobiles, chemical products, enamel components, paints and ochres, chalk, cement, matches, inks, tanning extracts, dentrifices, and talcum. In addition to the increase of duties on the goods enumerated the council of the Society is giving serious study to the matter of organization and nationalization of commerce for further protection against aggressive foreign competition.

The Rare Metal Products Co., Glen Ridge, New Jersey, is planning to increase the capacity of its plant, and has acquired the works of the Seton Chemical Co., of Belleville, New Jersey, consisting of a manufacturing building 400 ft. long with auxiliary structures aggregating a total of about 30,000 sq. ft. of floor-space, and covering an area of 7½ acres. The consideration for the property is said to be $150,000. The plant will be used by the company for the manufacture of antimony and other metal products.

The Finance Exploration & Development Corporation of America has been incorporated under the laws of the State of New York for the purpose of investigating and financing mining, oil, and industrial enterprises. An initial capital of $500,000 has been provided. This corporation will maintain a staff of skilled engineers to examine the merits and possibilities of enterprises needing additional capital for development or expansion. The directors are William R. Jones, Jackson B. Sells, Burt Brown Barker, E. L. Kerstetter, and Homer L. Carr. Mr. Carr is consulting mining engineer for the corporation, with offices at 50 Broad street, New York City.

The Compressed Air Society, upon the recommendation of its Technical Committee, has adopted the following definitions of certain compressed-air terms in order to eliminate confusion:

The displacement of an air-compressor is the volume displaced by the net area of the compressor-piston.

The capacity should be expressed in cubic feet per minute, and it is the actual amount of air compressed and delivered, expressed in free air at the intake-temperature and at the pressure of dry air at the suction.

Volumetric efficiency is the ratio of the capacity to the displacement of the compressor, all as defined above.

Compression efficiency is the ratio of the work required to compress isothermally all the air delivered by an air-compressor to the work actually done within the compressor-cylinder, as shown by indicator-cards; it may be expressed as the product of the volumetric efficiency (the intake-pressure and the hyperbolic logarithm of the ratio of compression), all divided by the indicated mean effective pressure within the air-cylinder or cylinders.

Mechanical efficiency is the ratio of the air-indicated horse-power to the steam-indicated horse-power in the case of a steam-driven, and to the brake horse-power in the case of a power-driven machine.

Overall efficiency is the product of the compression-efficiency and the mechanical efficiency.

The Society further recommends that the use of other expressions of efficiency be discontinued. Communications regarding this and related subjects may be sent to L. D. Albin, the secretary, at 30 Church street, New York.

The Denver Engineering Works Company

DENVER, COLORADO, U. S. A.

Announces that at the Annual Meeting held in June, 1918, the following Directors and Officers were elected:

BOARD OF DIRECTORS

H. W. Hardinge Frank E. Shepard William W. Torrence
Robert J. Pitkin Richard B. T. Kiliani

OFFICERS

President . . . . FRANK E. SHEPARD
Vice-President and Treasurer, RICHARD B. T. KILIANI
General Manager . . WILLIAM W. TORRENCE
Secretary . . . . ROBERT J. PITKIN

In addition to the manufacture of

Hardinge Conical Ball Mills

the Company will continue to manufacture

Mining and Milling Machinery Cylindrical Ball Mills
Electric Hoists Richards Pulsator Jigs and Classifiers
Mine Timber Framers Ovoca Classifiers, Etc.

This Company counts as one of its best assets the good will of its customers, and future business relations will be based on

Best Methods and Best Service

NOTES 105

THE RUSSIAN CRISIS 107

Address by Mr. Fedor F. Foss on the state of affairs in Russia; friendly attitude of the United States; motives of this country above suspicion; a military expedition to Russia must go with the expressed desire of the Russians; Czeko-Slovak revolt against the Bolsheviks; economic assistance needed for reconstruction of representative government in Russia. M. & S. P., July 27, 1918.

THE STATUS OF GOLD MINING 108

Testimony of Mr. Hennen Jennings before the Ways and Means Committee; Allied countries control over 85% of the gold resources of the world; what constitutes a desirable condition for a monetary standard; other metals than gold suggested; remarks of Sir Lionel Phillips; gold being sold below cost; proposals by Minister of Mines of British Columbia; gold mining placed on the priorities list. M. & S. P., July 27, 1918.

DISCUSSION

CHILEAN NITRATE DEPOSITS

By Donald F. Irvin 109

Difficulty of proving value of nitrate land on examination; reduction of cost of beneficiating the nitrate; lack of centralization in the nitrate business; need of a local technical society of nitrate producers; too much conservatism in the industry; technical problems awaiting solution; filtration methods. M. & S. P., July 27, 1918.

LOCATING METALLIFEROUS LODES CONTAINING ALUNITE

By Alkali 110

Application of the Potash Act to lode-mines containing alunite and orthoclase; necessity for protection against locations for potash. M. & S. P., July 27, 1918.

WAR MINERALS BILL

By George Warren Tower Jr. 111

Copy of letter to Senator Walsh on the need of protecting the output of the minor minerals; present committees have not the power, without the War Minerals Bill, to take necessary steps to ensure adequate supplies. M. & S. P., July 27, 1918.

ARTICLES

Page

EXPANSION OF METALS BY HEAT

By John Roger 112

Usually stated as percentage of elongation when samples of different length are heated an equal number of degrees; comparison does not involve things that are proportionate; properly, equal units of heat should be added to each; volumetric specific heat is a necessary factor in the equation. M. & S. P., July 27, 1918.

CONDITIONS IN RUSSIA

By Fedor F. Foss 113

Résumé of populations and racial components of Russia; origin of the Russian nation; psychology of the lower class; the 'intelligencia' and the influence of this class; lack of education and economics in the old empire; cultural statistics of Russia; how to help the country. M. & S. P., July 27, 1918.

PRESERVATION OF PIT-TIMBER 118

M. & S. P., July 27, 1918.

THE RUTH FLOTATION MACHINE

By Arthur J. Hoskin 119

Classification of flotation processes; principle utilized in the Ruth machine; distinction from the M. S. type, and the compressed-air type; function of oil in frothing; practical results. M. & S. P., July 27, 1918.

THE MENACE TO GOLD MINING 122

Proposal for re-habilitation of gold; questions of bonus, paying more for the metal, remission of taxes, and other aids; testimony of Hennen Jennings before the Ways and Means Committee; report of Minister of Mines in British Columbia on gold mining; conditions in California. M. & S. P., July 27, 1918.

MAGNETIC PROPERTIES OF MANGANESE AND SPECIAL MANGANESE STEELS 126

Abstract of a paper by Robert Hadfield, C. Cheneveau, and Ch. Geneau in the Proceedings of the Royal Society of London. M. & S. P., July 27, 1918.

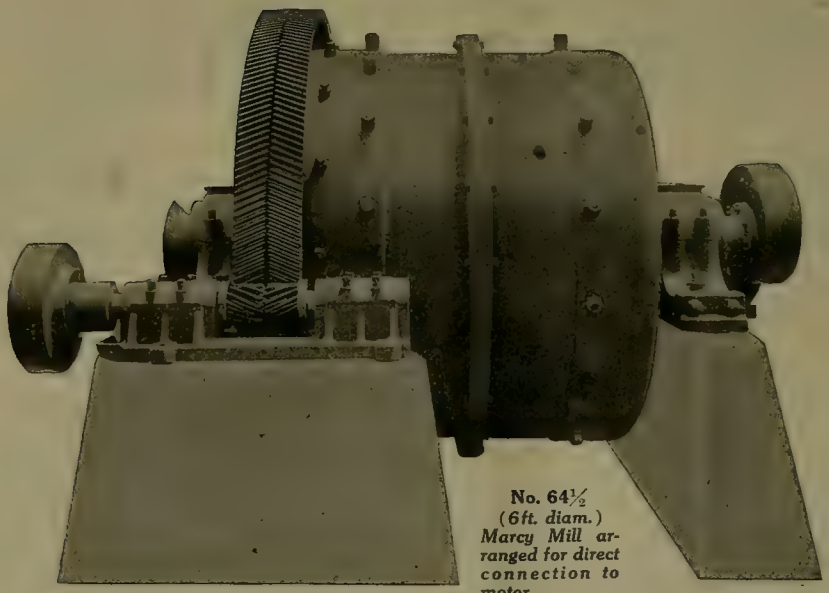
INDUSTRIAL PROGRESS 136

Established May 24, 1860, as The Scientific Press; name changed October 20 of the same year to Mining and Scientific Press.

Entered at the San Francisco post-office as second-class matter. Cable address: Pertusola.

Branch Offices—Chicago, 600 Fisher Bdg.; New York, 3514 Woolworth Bdg.; London, 724 Salisbury House, E.C.

Price, 15 cents per copy. Annual subscription, payable in advance; United States and Mexico, $4; Canada, $5; other countries in postal union, 25s. or $6.



No. 64½ (6ft. diam.) Marcy Mill arranged for direct connection to motor.

Investigate the Marcy Mill

—*for grinding for table concentration*

The Marcy Mill produces a splendid product for table concentration because of its non-selective discharge. There is no vertical classification or sorting action on the pulp. The Marcy Mill produces less slimes than Chilian Mills, Huntington Mills and stamps. It has far greater capacity with low power consumption **and produces a product of minimum size.**

On February 24th, 1915, the Daly-Judge Mining Company installed one No. 64½ Marcy Mill which replaced three 5′ Huntington Mills. The result was greater capacity, better table product, and a great saving in operating labor. This installation was followed with an order from the Silver King Coalition for two 6′ mills to replace Huntington Mills and rolls and grind for table feed.

The Marcy Mills are grinding efficiently for table concentration at the plants of the Federal Mining & Smelting Company at Wallace and at Hailey, Idaho. Marcy Mills are made in the following sizes: 3′, 4′, 5′, 6′, 7′ and 8′ diameter, capacity 50 to 800 tons per day.

The WILFLEY is the table

The new Marcy Mill booklet contains a full description of this mill and other interesting crushing data. Write for a copy.

The Mine and Smelter Supply Co.

DENVER SALT LAKE CITY EL PASO

NEW YORK OFFICE: 42 Broadway

THE Index to Volume 116 of this paper is now ready, and copies may be secured by writing to this office.

BEER, SONDHEIMER & CO. and L. Vogelstein & Co. have passed into the hands of the Alien Property Custodian, Mr. Mitchell Palmer, who is reported to have said that he had taken "another step to crush the German control of the metal industry in this country." *Qui vivra, verra.*

IMPORTATION of chrome ore from Cuba, Guatemala, Newfoundland, and Brazil will be permitted by the War Trade Board; the amount, however, is not to exceed 43,500 tons for the period ending March 31, 1919. Permission is given also to bring 10,000 tons from New Caledonia this year. No restriction is imposed upon receipts by land from Canada or Mexico, nor upon shipment as return cargo from European ports when no delay is involved in loading.

MAPS are essential to any geographic description. It is curious how little the average publisher appreciates this fact. Such maps as our daily press give us in order to explain the battles in Europe might be the work of high-school sophomores. There is no excuse for them. Accurate maps of France are available and could be reproduced daily in short order. That is where the New York 'Times' and other first-class newspapers show that they are well edited. No account of strategic moves is intelligible without maps drawn accurately to scale.

CHANGE of name of the American Institute of Mining Engineers has been approved by the Board of Directors and a proposal to that effect will be submitted to members at an early date. The name is to be changed by inserting 'and Metallurgical' before the word 'Engineers.' The idea is to be more specific and comprehensive, but the effort made to recognize the inclusion of metallurgists has the immediate effect of excluding chemists and geologists, among others, for these are neither mining nor metallurgical engineers. We cannot see any advantage in the change of name; on the contrary, we see several disadvantages, besides the one to which we have referred. Another is the fact that the present name has served for nearly half a century and has become honorably known all over the world. A third is the greater probability of confusion with the Mining and Metallurgical Society of America, which exists to do the things that the Institute does not care to do and serves as a nucleus of disaffection whenever the Institute needs discipline.

COLORADO is to have the next meeting of the Institute. The sessions will begin at Denver on September 2, to be continued at Colorado Springs on the succeedings days, and followed by excursions to Cripple Creek, Pueblo, Leadville, and Boulder. Arrangements are in the hands of a strong committee, headed by Mr. Spencer Penrose. An effort will be made, naturally, to discuss the production of minerals in relation to the War and to stimulate the work of the profession in behalf of the Cause.

PATRIOTISM finds various forms of expression. A correspondent to the 'Chronicle' writes to suggest that the 'German' name for the month of August be replaced by the 'American' name of Samuel. The gentleman that makes this illuminating suggestion is called Jacobs, a good old Anglo-Saxon patronymic, of course. We knew that the Pan-Germans claimed most of the great men of the past, from Jesus to Dante, as theirs racially, but Augustus Caesar had a pedigree such as might permit him to escape the imputation of being a descendant of the barbarians whom his uncle Julius fought so successfully.

FROM the 'Financial Times,' of London, we learn that the Goerz company has purchased from the Custodian of Enemy Property in South Africa the 347,803 enemy-owned shares in that company and that these shares are to be offered to British and Allied shareholders at 13 shillings each, as against the current market-price of 14 shillings. This is an interesting precedent. According to our London contemporary, the enemy holdings in South African companies include 100,000 shares in the Goerz company, 106,900 in Consolidated Mines Selection, 110,000 in East Rand Proprietary, 458,800 in General Mining, 298,000 in Geduld, 266,700 in New Modderfontein, 224,250 in Van Dyk, and 307,200 in West Rand Consolidated, besides 435,050 shares in three other companies. In some cases these enemy holdings constitute a control; thus the New Mod-

derfontein company is capitalized at 350,000 shares, the General Mining corporation has 1,875,000 shares, the Geduld 875,000 shares issued, and the Van Dyk 500,000 shares issued. A block of shares even less than the majority will suffice for the control of a company. It remains to be seen whether these other enemy holdings will be treated according to the Goerz precedent.

SULPHUR and pyrite are in greater demand than at any time since the War began, partly because of the steady increase in the manufacture of munitions to meet the needs of a growing Army at the front, and partly as a necessary consequence of curtailing the importation of Spanish pyrite. No one knows when vessels again may be available for bringing more than the 10,000 tons per month allowed by the Shipping Board. In order to ensure a supply of acid-making material the War Industries Board has named Mr. William G. Woolfolk as controller of sulphur and pyrite, with authority extending to production and distribution of these essentials.

THAT the frank demand of the British Labor Party for a completely socialized government has not met with sympathy among the leaders of labor in this country is indicated by the refusal of the New York State Socialist Party to endorse a plank calling for a two weeks vacation, with pay, every year for workingmen. The reason for voting down the proposal shows that the spirit of American individualism still lives. The objection, as stated by Mr. Joseph D. Canon, was that "we are drifting now from the capitalist system, or 'stateism,' as it is called, and it may be more difficult for us to get anything from stateism than it is now from capitalism. Let us keep away from this dangerous legislation." The fact that the Socialists themselves recognize and fear the autocracy that lies at the heart of their system is a sign that the old order is not likely to be destroyed in this country. Democracy is a happy mean between the self-appointed autocrat, whom we call czar or kaiser, and the elected autocrat, whether represented by an individual or a governing board, charged with the administration of a socialized commonwealth. When the Labor party in a densely populated State like New York, where the evils of the factory system are near the maximum, still clings to the sweets of individual liberty, it is certain that the men of the West, who meet the opportunity of independent fortune more often that their brothers in the East, will not consent to enslave themselves under a form of government that would reduce them forever to the status of wage-earners.

ON July 1 the law organizing a zonal system of postal rates went into effect. The law establishes eight geographic zones at progressively increasing distances from the place of publication, and the payment of postage at correspondingly higher rates, ranging from ¼ cent per pound to 2¾ cents, a maximum of 3¼ cents per pound for the first year as against the former uniform rate across the continent of one cent per pound. These rates are to be increased each year for four years until the maximum rate will be 10 cents per pound. This is equivalent to an increase of from 50 to 900% above the old flat rate. Needless to say it represents a heavy burden on the business of periodical publications. Many journals and magazines will be unable to carry the weight of taxation and will succumb. In order that any publication may survive it will be necessary to distribute the additional cost between the producer and the consumer, that is, between the publisher on the one side and the reader and advertiser on the other. This new tax comes on top of a series of increases in expenditure, particularly the abnormal cost of paper and other supplies, not to mention wages. In 1916 we raised our subscription rate from $3 to $4 per annum, and it was accepted in the best possible spirit by our readers, who, apparently, recognized that a successful effort had been made by us to give them better value for the money received. No increase in advertising rates has been made, because the expanding volume of advertising has helped to overcome the cost incidental to abnormal conditions created by the War. We are grateful both to our readers and to our advertisers for their loyal support in these strenuous days; we intend to sit tight, making no increase either in the rates of subscription or of advertising at least for the present, in the hope that Congress may repeal or modify this destructive legislation. We hope to weather the storm of war without further changes in our rates and we intend to do our utmost to make this paper increasingly useful for the great cause to which every good citizen is committed heart and soul.

A wise movement has been started by a progressive manufacturer of mining machinery for establishing in Washington a bureau consisting of representatives of the leading makers of such appliances to co-operate with the War Industries Board and other committees in order to facilitate the production of the equipment needed in the mining operations of the country. It transpires that no co-ordination of the makers of machinery with the government agencies concerned in producing raw materials has been undertaken. The proposal to effect a voluntary organization for this purpose is commendable. Manufacturers of machinery have been severely handicapped in their efforts to obtain the iron and steel and other necessary metals on account of the priority advantages accorded to shipbuilding and some other industries. No one questions the wisdom of discriminating in their favor, but it must be apparent that the effect of crippling the mines by making it difficult to obtain mechanical equipment, must react in the end disadvantageously upon the output of ships and of other essentials for the conduct of the War. The plea of individual manufacturers of mining machinery may be overlooked, but combined action will command attention. It is to be observed also that such an association as is now proposed would make it possible to distribute orders in accordance with the abilities of the firms to make early delivery. In

this respect it would be possible to adopt the principle of the cartel, which played so important a rôle in giving solidarity to industrial effort in Germany before the War. We should not hesitate to appropriate a good idea from the Enemy, if, by so doing, we may increase our efficiency for overcoming him.

The Russian Crisis

On another page we publish the text of an address delivered by Mr. Fedor F. Foss before the Engineers Club of San Francisco. Mr. Foss is a member of a Russian mission to the United States and chairman of the mining committee of that mission; he came to this country in September last for the purpose of studying American mining and metallurgical industries, and particularly their relation to Government administration, technical societies, educational facilities—in short, anything contributing to the development of the profession and of the industry. He is a graduated mining engineer of the late Imperial Mining Institute at Petrograd; in politics he stands as a constitutional democrat, so that his point of view is largely that of the first provisional government organized by Lvoff, Milyoukov, and Rodzianko. His professional and financial connections with important enterprises in Russia enable him to speak authoritatively and sympathetically. The engineers that heard the address were impressed by the plea made by him for assistance from America to Russia, and by his reminder that the Russians had fought and died unflinchingly for the Allied cause until demoralized by German chicane. The spectacle afforded by the Russian retreat and political chaos has moved some of us to a cynical contempt, for which, on second thought, we ought to be sorry. Such a mental attitude can do no good. Russia is a great fact. Her sudden effort to rid herself of a corrupt bureaucracy headed by a weak autocrat moved our enthusiastic approval because we hailed it as a first step to the establishment of democratic government, but when the effort as suddenly degenerated into soap-box oratory, political buffoonery, and industrial nihilism, we were repelled and disgusted. Mr. Foss and other good Russians ask us to be patient; they tell us that the Russians are 80% illiterate, that politically they are children, easily misled, but with good instincts. Russia is in travail and we must stand by her in her dark hour, for the sake of the democratic ideals we hold dear and in the name of Abraham Lincoln. The President stated explicitly on May 18 that he intends "to stand by Russia as well as France." On June 9 he told the Mexican editors that we want nothing out of this war, which "so far as we are concerned is for idealistic objects." That is exactly why the United States can do more to help Russia than any other of the Allies. England, France, or Japan might be suspected to indulge ambitions of territorial aggrandizement or of commercial penetration. Foreign bondholders are unacceptable as political mentors. The United States has no pecuniary bias in her efforts at rehabilitating Russia, she does not desire to possess an acre of Russian territory, nor have our people made heavy investments of the kind that prevent Paris and London from being disinterested in the details of Russian re-organization. The President is about to appoint a commission, which, we presume, will report on the subject to him, for the purpose of guiding his future action. Meanwhile several thousand American marines are said to be co-operating with the British in keeping open a door into Russia on the Murman coast of the White Sea, near Kola and Alexandrovsk, which are accessible to navigation the year round. If any help is to be given, moral or physical, it is necessary to keep this door open. Whether an expeditionary force will be landed on this sub-Arctic coast, to march southward, is a matter that may not arise immediately. Obviously no army, whether of American soldiers or of other Allied troops, can accomplish any good without invitation and support from the party around whom, sooner or later, the Russian people may be expected to rally in an effort to restore order, and to drive out the German invader. The treaty of Brest Litovsk has proved to be a scrap of paper under cover of which the Prussian outlaw gave an air of legality to his scheme of spoliation. The seizures of grain and other supplies from the peasants under cloak of military necessity have opened the eyes of the Russian peasants to the menace of German depredation. Up to the present the German propaganda has succeeded in making the Russians fearful of the coming of an Allied expedition, and rendered them ready to oppose such intervention, which cannot be done effectively so long as it is regarded inimically by those whom it is intended to help; but a propitious moment will come, when the Russians have realized that none of the Allies, not the United States only, desires to annex Russian soil. Meanwhile the forces of reaction, not against constitutional reform, but against the savage anarchy of the Bolshevist mob, are crystallizing. The Czeko-Slovaks, who, in great numbers, deserted or were made prisoners when the Austrian armies were routed in 1915 and 1916, have organized themselves into several corps, one of which is acting as a nucleus of opposition to the Bolshevist misgovernment in Siberia. Another body of Czeko-Slovak troops has captured Kazan, the old Tatar capital, and dominates navigation on the lower reaches of the Volga. Generals Korniloff and Alexieff have been reported at the head of troops insurgent against the Bolshevist cabal. The news is fragmentary and confusing, for it comes from different parts of a region three times as large as the United States, but it suggests the growing opposition to the forces of anarchy now endeavoring to secure themselves in authority under German patronage and gives promise of a concerted attempt to re-establish order. This opposition to the German-Bolshevist party should be utilized in the interest of Russia and the Allied cause, which is that of democracy in Russia, as elsewhere. The independence of Siberia is well worthy of American recognition and support: it is being aided by the Czeko-Slovak troops that were on their way to France, by way of the trans-

Siberian railroad, when, contrary to their intentions, in self-defence, they had to capture Vladivostok, in conjunction with Allied naval forces. This Czeko-Slovak army controls 1300 miles of the railroad and, assisted by a Japanese-American expeditionary force, should soon be in a position to strike at the German invaders. Such a move, together with a flank attack from the north, from the Murman coast, would re-create an eastern front to which the Germans would have to re-direct their military energies, causing a diversion of incalculable help to the Allied offensive in the west, in France and Flanders. Any such move should be accompanied by a well-organized effort to lend economic assistance to the Russian people, thereby blocking the German scheme to exploit Russian resources, and eventually to mobilize the Russian peasantry on the side of the Prussian military machine. This war is no parochial affair; it is one of terrestrial amplitude, and must be viewed in a comprehensive way if it is to be brought to the one necessary conclusion.

The Status of Gold Mining

We return to this subject, because it is of immediate interest to most of our readers. On another page we reproduce the larger part of the testimony given by Mr. Hennen Jennings before the Committee on Ways and Means of the House of Representatives. He lays stress on the fact that the Allied countries produce most of the gold of the world, the British dominions and the United States, as we have remarked more than once, contributing about 85% of the total. Russia normally yields 5% more. Of the gold produced in neutral countries, it may be asserted that the major part of it is won by aid of British capital and by Anglo-American engineers. The enemy countries contribute barely 1% of the world's gold production. Why should we voluntarily relinquish this advantage by allowing any obstacle to handicap the vigorous exploitation of gold mines? It is the basis of credit, whatever people may say, and we must not allow the exaltation of war finance to becloud this fundamental fact. We published Mr. Jennings' essay on this subject six weeks ago. His colloquy with the Committee is interesting, if only to indicate the mental processes of the gentlemen participating in the deliberations. In passing, we venture to suggest that public documents should be revised before they are issued; the witnesses whose statements are reported ought to read the record, to protect themselves from errors, even in the preliminary issue, and the entire record should be read by a competent proof-reader, if not by an editor. We have protected Mr. Jennings against two or three obvious typographical slips, but the entire report of the proceedings shows the lamentable lack of revision. The members of the Committee appear to have been impressed with the value of iridium and depressed at the thought of its effect upon the gold standard. If mere 'preciousness' were the thing to keep in mind, why not elevate tantalum to the position of a monetary metal, or scandium, which would cost as much as $10,000 per ounce at least. To Mr. Rainey the suggestion may seem tantalizing, if not scandalous. His colleague, Mr. Sloan, objects to platinum because it is not "as desirable for the vision," which is true, for a $20-gold piece is indeed "a treat for sore eyes." Gold happens to have been selected as a monetary metal partly for that reason: it is beautiful; moreover, it does not corrode; it is heavy; it is distributed in nature in proportions rendering it neither too rare nor too common. It is more than a coincidence that the production of gold should have increased with the growth of base-metal mining and with the expansion of general industry. At the meeting of the Central Mining Corporation, in London, Sir Lionel Phillips acknowledged that "but for the British navy, the gold-mining industry would have come to a standstill." So would many other necessary activities. He made a friendly protest against the adverse exchange incidental to the purchase of South African gold by the Bank of England. The standard price was 85 shillings per ounce, whereas "the small amount now permitted to be used for trade purposes has risen to 115s. per fine ounce." He added: "That the raw gold from South Africa is worth more than the price paid for it in paper currency is not a difficult matter to demonstrate in general terms." The rates of exchange are not the true measure of its value, because it is used partly to regulate those rates, and without our [South African] gold the adverse exchanges would have been still higher. . . . If we could have paid for our commodities [mine and mill supplies] in our own gold, instead of depreciated paper, we should have obtained due compensation in value for part of the increase in working costs." These quotations from Sir Lionel's speech are given verbatim because they will find a ready response among those operating gold mines in the United States. In Canada similar ideas are fermenting. The Minister of Mines in British Columbia has approved the suggestion that all war taxes be remitted to gold-mining companies, that the increased freight-rates be abrogated in favor of low-grade gold mines, and that gold-mining be afforded such assistance as is being granted to other war industries. It is evident that the gold-mining industry of the world is becoming articulate and is asking for such public national support as it deserves. We are glad to note the announcement made on July 13, by the War Industries Board, that gold-mining has been listed as an essential industry, and all reasonable priority on material and supplies used in the production of gold will be given by the Priorities Committee. This action was taken at the request of the Treasury Department. It remains to interpret this decision. We hope that it will mean a remission of special war taxes, relief from increased freight-rates, acceleration of shipments of machinery, a check upon excessive prices on explosives, chemicals, and other supplies, and the prohibition of recruiting labor from gold mines to mines producing the base metals. All this will help, but more will have to be done if gold mining is to be kept alive.

Chilean Nitrate Deposits

The Editor:

Sir—There has just come to hand the copy of the MINING AND SCIENTIFIC PRESS of March 23, in which I note extended comment, in the New York letter, on the Chilean nitrate situation. The identity of your correspondent is unknown to me, but it is proper to state that his viewpoint is one which cannot be endorsed completely by those resident in this country and familiar with the business of nitrate production. Questions of nitrate as a war-material, and as a fertilizer, are of such importance to the United States, both now and in time of peace, that mistaken impressions should be corrected, lest they might affect in some way, the American viewpoint. To quote from the article mentioned, "Intending purchasers (of nitrate land) know exactly what they are buying." There are several well-known episodes in the recent history of the nitrate business, involving some of the large producers, in which the principals thought they 'knew exactly what they were buying,' but development and exploitation of the ground showed later a large and painful discrepancy in nitrate content. One property, well known in the nitrate world, has had reports upon its possibilities, based upon examination by qualified men, and these reports varied from a gross content of millions of quintals, to an estimate that gave no net recoverable value to the property at all. Discarding such exaggerated differences in conclusions, it is clear that there will always be room for honest differences of opinion on the reserve of caliche, in unexploited 'pampa.'

It is unsafe to infer that all estimates made by the Chilean government engineers for the Fisco, show less than the quantity available, since, by careless work (which is usual), the existence of barren patches may as easily pass unnoted as that of rich 'papas,' or bunches of high-grade material. The statement that "cost of Chilean nitrate may be lessened in spite of the frequent assertions to the contrary," is interesting, and I believe it to be true, but not for entirely the same reasons as those advanced by your New York contributor. To one who knows the pampa, it reads like an ill-timed jest, when the suggestion is advanced to boil the vats of a group of oficinas by steam generated in a central plant. The fuel consumed in the boiling of the caliche, in the present forms of treatment, is the largest single unit of cost, and this steam cannot be conveyed economically from one plant to another. As for steam generated for power-purposes, a central station to distribute electric power would be useful, but the saving afforded in fuel and costs would not be likely to bulk large when competing for low costs against synthetic nitrates, since the direct use of motive power at an oficina treatment-plant is relatively small, being largely confined to primary crushing, elevating crushed caliche, pumping solutions, and generating electric light. The oficinas of such companies as the Loa, or the Antofagasta, which are scattered over a tract of ground some 25 miles long by 6 miles wide, show the validity of this view. A late résumé of the economic situation in Chile, as affecting the nitrate business, written by F. Mella, of Santiago, which appeared in the MINING AND SCIENTIFIC PRESS, gives a very true sketch of the present difficulties, and the comparisons of pampa-power installations with high-grade metropolitan power-plants, like the Commonwealth Edison, for example, as suggested in the New York letter, are quite beside the point. The essential difference lies in the relative ease of distribution of power, and the permanence of the demand for it.

As to "an entire lack of any idea of centralization in the nitrate business," I agree, with some reservations. Your correspondent may not know that part of this diffusion of effort is enforced by an obedience to the Chilean mining code, which provided that only a certain maximum area of ground might be devoted to the purpose of nitrate making in a single oficina. This provision was supposed to guard the interests of the Chilean laborer, and thus always to supply him with numerous centres of employment. It is unfortunate, and has caused the erection of some small and economically unjustified oficinas, in the past.

The lack of co-operation complained of is more evident among the several companies than among the group of oficinas comprising any one company organization, as in most cases there is an effort to spread the overhead charges evenly among the various plants, and the staff-organizations of the oficinas cannot now be said to be excessively large, whatever they may have been before the War.

A much-needed innovation is the establishment of an organization analogous to the A. I. M. E., but limited to the nitrate industry, which would supply the mental stimulus and exchange of ideas that now is lacking entirely. Since the majority of the 'powers-that-be' in the nitrate business came by way of the book-keeper's office, it is not remarkable that the technique is not of an extremely high standard, and this fact operates strongly toward clinging to existing plans. Conservatism characterizes the industry generally, but there are marked exceptions, which are growing more and more numerous,

and this conservatism is, itself, not so much an indifference, as it is honest skepticism regarding the possibility of improvement, or else it indicates timidity in backing any novelty. The result has been rather amusing when it is realized that gyratory crushers, belt-conveyors, and recording conveyor-weighers are regarded as great novelties even at this time, while three years ago they were hardly known here.

"Lack of co-ordination in research-work" is true criticism, and it characterizes other phases of life in Chile, besides research work in nitrate making.

That the "techno-chemical problems involved in the treatment of caliche, and in the production of high-grade nitrate, are almost negligible," will be a welcome surprise to the energetic staff of oficina known as Delaware, in Taltal, Chile, where the Duponts have considered this problem as being far from "almost negligible," so much so that they have spent some years in arriving at their particular solution of the problem. Doubtless they will again be pleased when they hear that the "problems of a satisfactory recovery are entirely mechanical," when they bear in mind their own work on the important chemical conditions that govern the proper mechanical design of nitrate-extraction plants. The mutually inter-related action of the numerous dissolved salts, which exist in highly concentrated solutions all through the extraction-system of a nitrate plant, have been the basis of most interesting and profitable research by the chemists of the Dupont staff in Chile, as well as the equally important mechanical design.

When mentioning 'Delaware,' I do not wish to detract from research work by others in Chile, but it is a well-known fact that this oficina has maintained, and does now maintain, an unusually large amount of research study, and it is probably a more interesting example to American readers, on account of its American ownership, than any other oficina would be.

The concluding paragraphs of the New York letter are in general agreement with the facts. "Lack of co-ordinated research"; "hesitancy of the conservative owners to install modern equipment, due to dubious results afforded by up-to-date installations of doubtful applicability," are both truthful statements. "The autocratic control of all filter patents" was true at one time, but in the fall of 1917, the absurd claim of the representative of the Butters filter organization in Chile (Leslie Mennell) to the invention and ownership of the Oliver filter patents was rejected and nullified by an executive decree promulgated by President Juan Luis Sanfuentes, of Chile. Hence, this ridiculous situation, which was in many ways analogous to the old Moore-Butters litigation in the United States, terminated in much the same manner, and has therefore been eliminated from consideration.

As to the "mysterious attitude of the pampa chemist," this may possibly refer to the semi-annual 'new process' for the treatment of caliche, which is evolved from the inner consciousness of some resident of Santiago or Valparaiso, and is at once caught up by the local newspapers as the long-sought panacea for the nitrate world. I have read the specifications of several of these and have usually found them to emphasize the non-essentials, or to state that "este aparato tiene que trabajar, forzosamente." Such episodes certainly tend indirectly to cast unfair ridicule upon the unassuming pampa chemists. Since, in many cases, the oficina chemist is treated as little more than a druggist's clerk, and may even combine with his own work that of 'bodeguero' (warehouseman), or even 'practicante,' the wound-swabber and basin-holder for the local doctor, it is unreasonable to expect from such an one, either the fund of available information that a thoroughly trained chemist would bring to research work, or the energetic interest of a well-paid engineer in developing new metallurgical technique.

I am in touch with the present efforts that are being made to improve the operation in nitrate-making, particularly as regards economy in treatment, costs, and extraction, and with one exception these efforts do not limit themselves to the consideration of the use of the equipment of one firm alone, as is intimated by your correspondent. Modern metallurgical plans and machinery are being tried in various places, and whenever a device promises utility it is being tested, either at one plant, or at another, of the progressive organizations. From all these efforts a general fund of data will accumulate, and thereby, doubtless, the cost of producing Chilean nitrate will be lowered considerably, but the export tax imposed by the Chilean government, amounting to 28d., plus some 60% of super-charge per quintal of nitrate shipped, is a great clog on efforts to achieve cheap production. However, that is mixed with considerations foreign to questions of technology.

DONALD F. IRVIN.

Antofagasta, Chile, May 30.

Locating Metalliferous Lodes Containing Alunite

The Editor:

Sir—Referring to the interesting question in the letter by J. F. Law, together with your comment, in your issue of June 22, I beg to ask whether the interpretation which you give does not indicate the possibility of some unpleasant conflict of interests? For example, if a man should locate a claim under the old law in order to possess himself of metalliferous deposits, might not another party, realizing the existence of potash minerals in the vein, which the original locator had failed to claim under the special potash law, demand from the Department of the Interior a prospector's license covering the same ground? If, then, he should demonstrate the existence of valuable potash minerals in the vein, would the Department not be obliged to issue a lease to him, resulting in the unique situation of two sets of owners having rights in the same mine with respect to different substances? Furthermore, if a man should locate a gold mine

that happened to lie adjacent to a pegmatite dike containing high-grade orthoclase, assaying 10% or more in potash, might not the innocent gold-miner be interfered with seriously by some one else undertaking to locate the contiguous dike within his claim? It seems to me that Congress must have overlooked the fact that potash minerals are likely to be found associated with metalliferous lodes, even constituting part of the gangue of such lodes.

The possibility of bringing about such an embarrassing situation as this for the sake of establishing enough of a right to potash to admit of harrassing lode miners with the peril of litigation would seem to make it important for owners of lode mines to investigate their deposits to ascertain whether potash minerals were present, and, if found, to protect themselves by applying for a lease under the potash law.

Goldfield, July 1.

War Minerals Bill

The Editor:

Sir—I am enclosing a copy of a letter I sent to Senator Walsh of Montana this week. If you think proper you may publish it. I might add that my interest in the War Minerals Bill is not because of a desire to control or to regulate the mining interests, for they are doing all in their power, but to co-ordinate the work, so as to prepare to meet deficiencies and, where necessary, to adjust the difficulties of small companies and to aid them. England and France have found this necessary. Why do we not profit by their experience?

Hon. T. J. Walsh,
Washington, D. C.
My dear Senator Walsh:

Replying to your kind letter of May 7, I would advise you that I was in Washington from May 13 to 16 and attended two of the Senate committee hearings on the War Minerals Bill. I was fortunate in hearing the testimony of D. G. Kerr, vice-president of the United States Steel Corporation. I hesitate to comment too freely on this and other matters lest my remarks may be interpreted as adverse criticism, whereas in reality my interest is constructive and is to urge legislation that will co-ordinate the work coming under this head, thus enabling the producers, the consumers, and the Government to work together with complete understanding, and in a way that will meet the demands of the War for greatly increased production. Witnesses have stated to your committee that there is already sufficient special law to do the things necessary to increase mineral production and to protect and encourage it. In any case this legislation is scattered and not uniformly interpreted. Different departments must be consulted and must authorize different proceedings. Red tape must be overcome; authority and centralization must be provided to give quick action and to execute a far-seeing plan for providing necessary materials. This will be accomplished by the War Minerals Bill. It is the principal reason for this bill. As to details, I believe these have been well threshed out in the House and before the Senate committee. I will ask for your special consideration of one or two items.

There are many small properties owned by men of little or no means that are necessary to the Country at this time if production is to be assured. Who is going to finance them? The big companies have not done so as yet, and in any case they have enough to do to get out their production. Besides they are not miners. The financiers and the banks cannot or will not because prices are far above normal and are not guaranteed for a sufficient time to assure them the return of their money, and also for the further reason that their profits are limited by the Excess Profits Tax Law. The establishing of a price for sixty or ninety days does not protect a War Industry that it may take six months or a year to develop, equip, and bring to a producing state. Most of the best and largest mines that can make money under normal conditions are now in operation. Their production is insufficient to meet the needs of the Country. Ships are not available to import the material in sufficient quantities. The Government must provide either laws, guarantees, or prices. It may even in some cases have to operate. Nothing essential to bringing to us a complete victory in this war can be left undone.

With reference to price-fixing it would seem that one fixed price for any product is not just, because large rich mines would gain profits, which cannot always be guarded against or recovered through excess-profit taxation. A 'cost-plus' is likewise objectionable because it leads to extravagance. It has not proved uniformly successful in shipbuilding. I can only suggest a 'zoning system', combined with a graduated scale based on the size and richness of the property, and on operating and transportation charges from the mine to the market. This would correspond to a preferential such as has been given to small coal mines. Governmental operation should be authorized in the case of urgently needed materials, but only as a last expedient when a mine is closed because of litigation; when the owner refuses to work the property; or when it is owned by an alien enemy or doubt exists as to whether the ownership is truly American, that is, owned by naturalized citizens born in enemy countries.

I shall be glad if you will bring these matters before the Committee with the further comment that the measure will assure the needs of the Country and be popular if the administrator selected is a man with long practical experience and training in mining as well as business—such men for example as B. B. Thayer and Pope Yeatman.

GEORGE WARREN TOWER, JR.

New Rochelle, New York, May 29.

ACETIC ACID PRICES have not been fixed, but by agreement the quotation is 15¾c. for 100% as the basic price, and 19c. for glacial acetic. These are based on acetate of lime at 4 cents.

Expansion of Metals by Heat

By JOHN ROGER

The expansion of metals by heat is usually given as the percentage of elongation that takes place when samples of the different metals of equal lengths are raised in temperature an equal number of degrees, for instance, from 500 to 501°F., thus establishing a co-efficient of linear expansion. When the expansion is given volumetrically, that is, by equal volumes of the dissimilar metals, the relations of the co-efficients are considered to be the same, that is, the metal is supposed to expand equally in all directions, the volumetric expansion being the linear expansion multiplied by three. The irregularity of these co-efficients for different metals has led to much discussion as to the cause when the great irregularity observed is not due to the peculiar behavior of the metals but to the way in which the co-efficients have been determined. The figures given by different experimenters lack uniformity, so that only approximate relationships can be shown, but they are near enough for present purposes.

It must be evident that if the temperature of one cubic foot of nickel is raised 1° F. with a specific heat of 59.97, and the temperature of 1 cu. ft. of lead is raised 1° F. with a specific heat of 21.97, and the relative expansions are compared, the comparison does not involve two things that are equal or proportionate. Almost three times as much energy has been added to the nickel as to the lead, and it should be clear that co-efficients determined in this way must lead to confusion. To get the proper relationship in the expansion equal units of energy must be added to each. If the co-efficient of expansion, as determined by equal units of temperature, is divided by the volumetric specific heat we will get co-efficients by equal units of energy, and these will be found to be, in a general way, inversely proportionate to the force of atomic attraction, as indicated by the number of degrees between normal (the temperature at which the specific heat was taken, say 500° absolute) and the fusion temperature for each metal. The co-efficients of expansion would seem to increase as the metal gets softer, but the figures are not regular enough to admit of saying that this is actually so.

they are no doubt far from being correct. The column 'Co-efficients of expansion by equal units of temperature' is supposed to be the co-efficients per cubic foot of metal, in each case raised in temperature from 500° to 501°, that is, raised 1°, which for nickel would give $59.97 \times 778 = 46{,}356$ ft.-lb., while for lead it would represent $21.97 \times 778 = 17{,}062$ ft.-lb. of energy, and for the other metals an amount proportionate to their specific heats. The column 'Co-efficients of expansion by equal units of energy,' gives the co-efficients by temperature divided by the specific heat in each case, which gives the expansion of one cubic foot of each of the metals, due to the absorption of 778 ft.-lb. of energy, and these co-efficients, as will be seen, are in a general way, inversely as the force of cohesion, as indicated by the melting temperatures, or just what might naturally be expected.

The confusion as to the expansion of metals by heat may be said to come from three things: first, from estimating the specific heat of metals by gravimetric proportion; second, from failure to differentiate between heat and temperature; and, third, from the contemplation of latent heat, something which does not really exist.

GOVERNMENT STANDARDS FOR ELECTRO-PLATING have been fixed at a conference of military authorities with representative members of the plating industry, officials of the American Electro-platers' Society and members of the Bureau of Standards staff. It was decided that zinc-plating is the most efficient method of preventing corrosion of iron and steel. No specifications are necessary for materials not subject to severe corrosion, but black finishes should be specified as 'black nickel,' and copper-sulphide finishes eliminated. The Preece test, the NaOH test, and $SbCl_3$ tests, are the most efficient for testing zinc-plated products. The NaCl spray test is advised until a more suitable one is found. The current unit test is adopted for determining the thickness of zinc to be deposited to withstand the test. For surfaces of separate units, the minimum amount of zinc should be deposited that will withstand the corrosion-test. As a basis, the weight deposited should approximate 50 mg. per sq. in. (6.45 sq. cm.) of surface. Occlusion of H from pickling and plating solutions containing free acids cause crystallization of high-carbon steel, so the wet method of tumbling, together with the use of an abrasive

In preparing the above table the figures have been taken from the best sources of information available, but with an alkaline soda solution is suggested. Zinc-plated steel is protected by paraffin and paraffin oil.

SCENE ON THE TRANS-SIBERIAN RAILROAD

Conditions in Russia

By FEDOR F. FOSS

*To understand events in a large country like Russia it is important to know what this country represents; what are the chief characteristics of the people and the general economic conditions.

I would remind you that the total area of Russia was over 8,500,000 square miles, with a population of 181,000,000 people. The United States has 3,500,000 square miles and 100,000,000 people. Two-thirds of the whole population are Russian Slavs, divided into Great Russians 66%, Little Russians 26%, and White Russians 7%, besides 8,000,000 Poles and other Slav branches. Then come the representatives of the Indo-European group; Letts, Livonians, Gmuds, numbering 3,000,000. The Western European races include Germans, Swedes, Norwegians, English, Danes, and Dutch, in all about 2,000,000. The Roman family is represented by 1,500,000 Rumanians, French, and Italians. The Semitic race, besides Jews, includes Syro-Chaldeans and Arabs. The Ural-Altai people are represented by 3,500,000 Finns and 14,000,000 Tatars. The religions practised in Russia are many. The principal ones are the Greek Catholic about 70%, the Roman Catholic 9%, Mohammedans 11%, Jews 4%, Protestants and Evangelists 5%. From these figures you can see that Russia is not a nation but a gigantic conglomeration of races, religions, and languages.

The first question that arises is, how could such a nation have so long been a strong military power, and how could such an empire collapse so easily?

Russia was created by the Great Russians. This race, even at an early stage of development, showed constructive force. In the past centuries there have been just two ideas that in the minds of the peasants have stood for the State; they were the Czar and the Church. During the feudal period the Czar was the sole sovereign, the supreme judge, with the power of life and death over all. You will remember that in Russia feudalism ended not so very long ago. The peasant of earlier days neither saw nor comprehended the complex connections between political, social, and economic forces; to him the Czar was not only monarch in the social and political domain, but in order to explain the life and activities of nature, he accepted him as the personification of Providence.

The psychology of the lower class is simple. A Russian must see and touch a thing in order to appreciate and understand it. The men who created the Orthodox Church in Russia realized this phase of the Slav mind; hence that religion is founded on the worship of God through the pictures of Christ, the Holy Virgin, and the Saints. The direct conception of an abstract idea is foreign to the mind of the peasant. Therefore the Church provides an innumerable list of saints whose pictures or ikons are the media through which the peasant mind approaches the Deity. Similarly, to the peasant, the idea of the State was expressed by the person of the Czar and by the institution of the Church. The pictures of the Czar used to be as common as the ikons; they exercised the same function in relation to the Government as the religious pictures did toward the Church. In short, the Czar and the Church were the keystones in the arch of government. In a day, when the country was entirely unprepared for such a change, the Czar ceased to exist and the Church was eliminated. To the

*An address delivered before the Engineers Club, San Francisco, on July 2, 1918.

common people, the State seemed to have disappeared. They have never had a national idea save in terms of Church and Czar, and when both were removed their minds lapsed into pitiful confusion. The masses did not in the least realize the significance of what had taken place, there being no strong educated class to guide them.

The division of the Russian population into classes does not mean much. We have the following divisions: Peasants, burgesses, non-Slav citizens, Cossacks, clergy, honorary citizens, and nobles. The peasants constitute about 77% and the burgesses about 11%; but for our purposes it is better to say that we have two classes, one educated, and the other illiterate. A very small portion of the latter has been through the primary schools, but within a few years they have forgotten what they learned, because they had no use for learning. The average percentage of illiteracy in Russia is 79. The average literacy for both sexes is 21%. It is 29% for men, 13% for women. Of course, in some towns we have a higher percentage of literacy, up to 79, 55, and 33% in some Western cities. These two classes, as I said above, one more or less educated and the other wholly uneducated, have never been welded together. Russia has had no class that understood the vital necessity of industrial development.

For a large group among the educated people we have a special term, the 'intelligencia.' These persons have been brought up on all kinds of philosophies and social ideas, with an inclination to "save the world," to "assist the unfortunate," and generally to improve conditions by talking. They have tried to make the peasants feel that they are unfortunate and oppressed, and that they must demand their rights. Such suggestions, combined with the tyranny of an autocratic government, and without the development of the productive forces of the nation, created dissatisfied talkers who did not know their own wants. The intelligencia has been deprived of all elementary rights and, oppressed by the autocracy, it had no ability to create an organizing and productive class.

The conditions of Russian life before the War can be described in the words of Gregor Alexinsky: "Contradictions abound in all spheres of Russian life. In the economic domain we see modern capitalism developing itself with American celerity, alongside medieval villages whose economy is still almost natural. In the social domain the proletariat, in part conscious and organized, eager to procure the triumph of the ideal of universal happiness, and trained in the ideas of a theoretical socialism, live side by side with the feudal 'seigneurs' who do not recognize even the most elementary demands of justice. In the political domain the most sincere and ardent aspirations toward liberty contend against the worst possible methods of repression. And in the literary and artistic domain, while many Russians are known far beyond the frontiers of their country for the novel simplicity and profundity of their thought, 120,000,000 inhabitants of Russian soil are absolutely illiterate. The youth of the intellectual and working classes are materialistic atheists, but the most barbarous prejudices, the most primitive fetishisms, constitute the mentality of the Russian peasant. On the one hand is an arrogant aristocracy, incessantly feasting in stone-built capitals. On the other hand are millions of human beings sheltered under straw roofs and nourished by black bread."

I would mention that some prominent statesmen of Russia have many times put forth the idea that it is better to leave the peasants in entire ignorance than to give them only a little education; they insisted that a small amount of education produces discontent and socialistic ideas without compensating advantages. Therefore these statesmen have hampered educational development. I can make a comparison of the Russian intelligencia, thoroughly educated but not practical and partly idealistic, to a thin layer on an ocean of ignorance. While the ocean was quiet, the intelligencia floated safely, but when the ocean became stormy, the layer was suddenly broken up into many pieces and was driven back and forth on the restless waves without any organization, sense, or ability to do anything.

The contrasts of Russia are caused by the clash of modern European, or if you will, Universal ideas, and the remains of the Middle Ages, the heritage of the period when Russia still lived her own life and was not yet drawn into that mill of the world which crushes between its mighty stones the grain of humanity to make the bread of the future.

Before the beginning of the world-war Russia was the largest civilized empire in the world, a Colossus, but with legs of clay. The foundation of government lacked two elements, education and economics. Now I shall turn to detailed figures in order better to illustrate the internal life of Russia. The density of population varies greatly and is comparatively sparse. It averages 10 inhabitants to the square kilometre. The densest population is 114 in the province of Moscow, 104 in Kiev, whereas the least density is 0.4 in Yenesei. Of the total population 13% is in the towns and 87% is rural.

In comparison with other civilized countries Russia is first in the number of inhabitants and in having the smallest average per square mile. In 1912, out of 1063 towns and urban settlements with a population exceeding 10,000 (the number of urban settlements is 182), only 219 had an organized water-supply, that is, 20% of the total. Of the remaining 204 towns only 167 provide water to private houses. In 52 urban settlements the inhabitants have to fetch water from central reservoirs. There are settlements with a population exceeding 100,000 that have no water-supply. Only 59 systems with extensions to houses have filters. Only 40 towns have canalization or sewerage. The refuse is carted to some distance from the town in the majority of municipalities, but a few towns have special space reserved for the purpose. In 61 cases the refuse is washed by high-water, in 24 by ground-water, and in 5 by both. In 492 cases all refuse is thrown into the sea, rivers, and ditches, or not removed at all.

In the whole of Russia, out of 1231 towns 1068 have

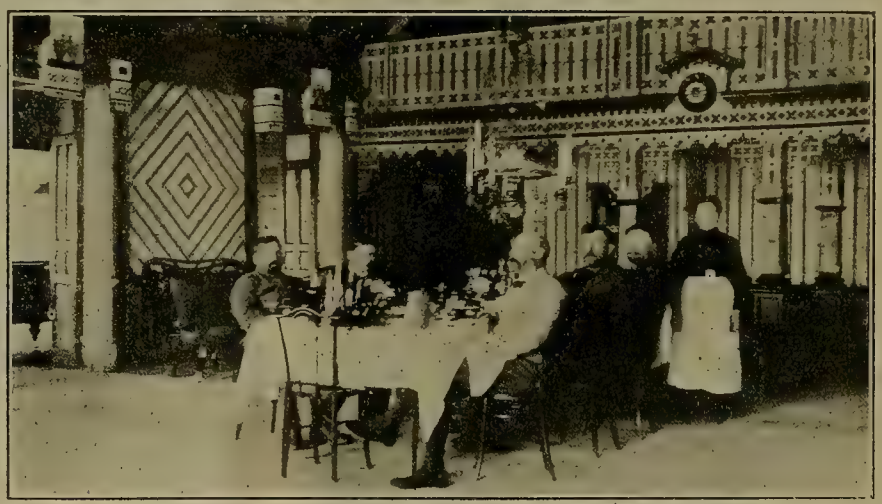
public lighting; of these, 162 are lighted by electricity, 128 by gas, 1028 by kerosene; 1047 towns have slaughter-houses, 1136 have fire-brigades, 54 have tramways, 32 have telegraphic service, and 314 have telephones. There are 902 towns with public libraries and reading-rooms (the United States has 18,000 libraries), 76 towns publish 919 periodicals, 178 towns publish 576 newspapers (the largest circulation being about 200,000 per day). The United States has more than 22,000 periodicals. About 510 towns have printing-presses, 124 have typo-lithographic establishments. There are 136 towns with museums.

LUNCH COUNTER ON THE TRANS-SIBERIAN RAILROAD

According to the last census, the contagious cases and infectious diseases average 19,500,000 per annum, this being 12% of the total population. The proportion of diseases was as follows:

	%
Itch	22
Malaria	18
Influenza	15.5
Syphilis	6.5
Typhus	3.3
Trachoma	5
Dysentery	4.3

This indicates the lack of hygiene and rudimentary sanitation. We had about 22,000 doctors, including 1750 women. In European Russia there is one doctor for 1300 people in the towns and one for 21,900 in villages. In Asiatic Russia is one doctor for 2800 townspeople and one for 37,600 villagers. The number of beds in hospitals has been about 220,000. During the War it has been enormously increased. Of every 1000 infants 267 die before they are a year old. The birth rate is 45 per 1000.



HEADQUARTERS OF THE VESSENNIJ MINE. THE DINING-HALL.

PASSENGERS EMBARKING ON A RIVER STEAMER

The following figures show the state of education: Russia has 52 superior schools, together with 135,000 middle and primary schools with 9,000,000 scholars, of which 82% attended elementary schools, 26% secondary schools, 3% special ele-

mentary and secondary schools, and 20.8% had the higher education. The remaining 7% attended private schools. The annual expenditure during recent years has been 150 million rubles, or $70,000,000. So as to make the comparison easier I shall remind you that you have in the United States about 270,000 elementary schools, and that your school and college enrollment is 22,480,000, with 700,000 teachers and an annual expenditure of over $800,000,000.

The relative importance of the different occupations in Russia is as follows: Rural 77%, manufacturing and other industries 10%, private and personal services 4.5%, trade and commerce 3.8%, transportation 1%, mining 0.4%, professions connected with public needs 0.7%, government and public service 0.6%. In the United States agriculture takes 35.7%, manufacturing and industry 24.4%, commerce, trade, and transportation 16.4%, and personal services 19.2%.

In order to outline the conditions of economic life of Russia I shall mention that of the total production of Russia (which we reckon at 20 billion rubles), more than half is agriculture. The land question is the basic question for Russia. The country has a tremendous area suitable for agriculture, forming one-third of the total surface in European Russia, something around a billion acres. Moreover, there are large arable areas in Siberia and Middle Asia. Of this land 39% is owned by the Government, 36% belongs to peasants, and 25% to other private owners. Five-sixths of all the peasant-owned land is communal, that is, a community uses the arable land, the woods, the meadows, and water-supply in common.

About 270,000 acres are sown with cereals, potatoes, and fodder-grass. As to crops, I need only mention that the largest output of cereals in Russia is rye, 35 million tons; wheat, 24 million tons; oats, 13.5 million tons; barley, 10 million tons; and potatoes, 27 million tons. If we compare Russia with the United States according to the relative area under cultivation, we find that in the United States it constitutes 10% of the total land, whereas in Russia it constitutes but 5%. Taken with reference to the population of the two countries, we find that to each inhabitant of the United States there are about 2½ acres of cultivated land, while in Russia there are only 1½ acres. The prevalent method of agriculture in Russia is the three-crop system. Russia has a low average yield of cereals per acre, averaging 10 bushels for wheat against 15 to 18 in the United States, 17 in Rumania, 20 in Germany, 30 in Sweden, 34 in England, and 44 in Denmark. At the same time the expenditure per acre for soil improvement in Russia is the smallest. In Norway it is $1, in Prussia 67c., in Sweden 25c., in the United States 21c., and in Russia 5c. per acre. On account of faulty methods of fertilization, the lack of irrigation, and the primitive implements employed, the peasant's economy is completely dependent upon natural conditions, or, as they say, upon God. In mining and metallurgy Russia, despite her vast resources, is far behind the United States, the first producer of metals in the world.

	Russia, tons	United States, tons
Coal	40,000,000	585,000,000
Pig-iron	4,500,000	60,000,000
Copper	40,000	1,000,000

The production of lead and zinc, silver and tungsten, has been merely started; only in platinum do we lead the world, producing 95% of the total output.

In the consumption of all staples Russia is at the bottom in comparison with other nations, thus:

	Russia, lb. per head	United States, lb. per head
Coffee	0.14	11.0
Tea	0.91	1.1
Sugar	0.5	1.5
Pig-iron	50.0	1,100.0
Coal	440.0	11,700.0

The consumption of copper, lead, and spelter is even on a smaller scale, so I need not mention these figures.

The hunger for land on the part of the Russian peasantry has been interpreted by Russian socialists as an indication that the peasants are natural socialists. This idea was supported by the fact that, as I have mentioned before, five-sixths of them hold their land in common. But this conclusion is absolutely wrong, because the Russian peasant is a socialist only up to the moment when his land-hunger is satisfied and he becomes a private land-owner. After he gets the land and tills it, he will not allow any socialist to take the land from him, nor will he try socialistic experiments with it himself. In confirmation of this idea it may be stated that in seven years, after the enactment of a law permitting the peasants to go out of their communities and settle on the isolated farm-lands, 5,000,000 peasants settled upon 86 million acres. In order to show how rapidly the peasants applied for land, it is interesting to mention the following figures:

Applied in	Households
1907	219,000
1908	380,000
1909	704,000
1910	650,000
1911	678,000
1912	1,226,000
1913	1,105,000
	7,598,000

All this shows that Russia affords a big field for development. She has one of the largest systems of railroads in Europe, about 50,000 miles, but when you make a calculation per square mile of per head of population, the figures are small. They represent 1 kilometre per 100 sq. km. of area in European Russia and 0.07 km. per 100 sq. km. in Asia. For 10,000 inhabitants, it represents 4 kilometres in European Russia, and 5.8 km. in Asiatic Russia. In the United States the figures are 4.3 km. per 100 sq. km. and 42 km. per 10,000 population.

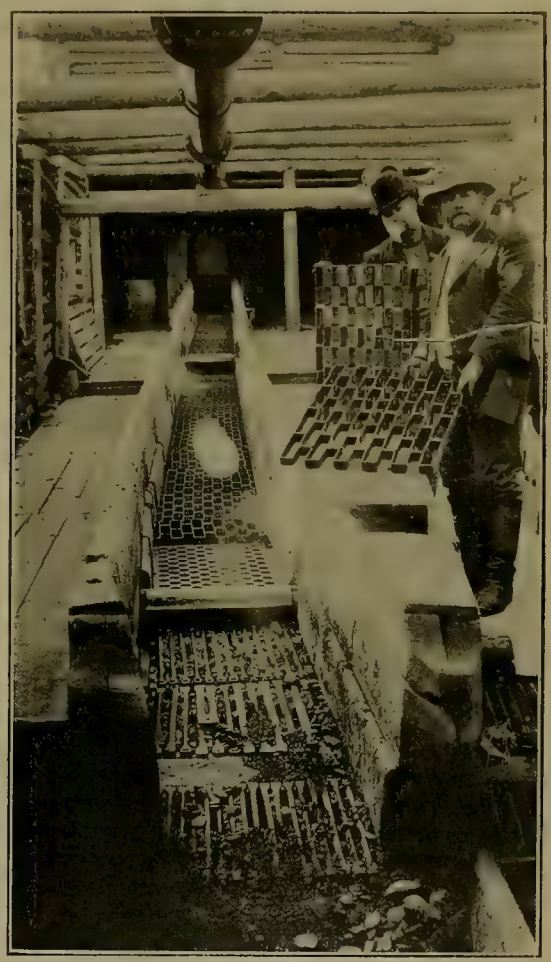
It will be seen from these figures that, despite the fact that Russia was an old empire, she was quite a young country from the standpoint of development, from the first necessaries up to the edcuation of the people. She dreamed of freedom, but she was oppressed by the autocracy. She was poor and undeveloped, with practically no industries, but with faith in her future. And when the Hun started his drive for world-conquest, this same Russia promptly mobilized eight million soldiers of the very best quality, who started a brave offensive against the Germans and Austrians. When these

half-educated people saw that the German was a treacherous enemy, killing the wounded and torturing the prisoners, the Russian soldiers were fired with resolution, and made a marvelous campaign in East Prussia and in the Carpathians, taking more than 1,500,000 Austrian and German prisoners. Through the shortsightedness and stupidity of the Government the soldiers did not have enough munitions and implements; they fought bare-handed and yielded only when they had nothing but sticks to oppose to rifles. By this campaign

ON THE VITTIM RIVER. THE CAPTAIN, TWO SCHOOL-GIRLS, AND ANDREW NISBET

Russia saved France and Europe, and gave to England time to prepare her army. In three years Russia has mobilized 16,000,000 men and has lost 7,000,000 in casualties and sickness.

The Russians, after having got freedom so easily—for the power of the autocracy fell as quickly and as easily as a rotten apple falls from the tree in a light breeze—accepted the promise of the socialists and the German spies that they would at once receive peace, land, and prosperity if they would lay down their arms. Though they had suffered so much from German cruelty during the War, nevertheless they believed that there was no use in further fighting, that all people are brothers, that the War was a device of emperors and capitalists to gain power and money from the common people. The poor peasants, with their eye on the land, thought that if they could have plenty of it they would not need to fight Germany, and that Germany would make peace at once if they practised the principle of non-annexation and no indemnities. While the new-born Russian free citizen talked continually about the principles of universal happiness, the German agents were doing their destructive work. They succeeded in disorganizing the Russian army by introducing so-called democracy into the army, namely, the election of officers. The result of this propaganda is well known. The Russian army of more than 12,000,000 men disappeared as snow before the rising



THE RIFFLES USED AT THE VISSENNIJ GOLD MINE

sun of Russian liberty. Most of the officers were killed, and instead of the army came an armed mob, which, under the guidance of extremists, idealists, and German agents, is ruling Russia now.

The Russian soldier, lacking education, especially political education, without any knowledge of statecraft, readily accepted the simple idea suggested by the Germans and the Bolsheviki: "Why fight and face death when you now have full liberty? Go back to your homes, take possession of the land and divide the wealth of the capitalists, who are the enemies of the oppressed peasants." "And go back quickly," warned the propagandist, "because if you come too late, all the land will be divided among the people and you will be left out." In

the first month the number of desertions from the Russian army was increased by 2,000,000 men.

I often hear the question, "Where are the Russian intelligent classes? Why don't they help Russia to recover herself?" You know the answer now. The proportion of intelligent people is small, scattered, and now for the most part killed. The Russian intelligencia is paralyzed, and, being under the suspicion of starting a revolution against the Bolsheviki, the small number still alive is deprived of arms and of any means of starting a counter-revolution. Even the banks are seized by the mob in order not to allow somebody to get money to start a drive against the Bolsheviki. Russia is like a wealthy house where lived a large family. The house is attacked by burglars and the head of the family is killed. What can the housewife and the small children do against these burglars when they have no means of defending themselves, and when the natural protector is killed? Would you accuse the children of approving the work of the burglars? No. In the same way the Russian people, when even the delegates of the peasants to the Constitutional Assembly were driven out at the point of the bayonet by the Bolsheviki, went back to their homes, not being able to organize. They are awaiting events. From the outside it would seem that the Bolsheviki are ruling Russia with the consent of the Russian people, but the Bolsheviki acquired control of Russia in the same way in which a small boy with a whip acquires control of a large bull with a ring in its nose.

Mankind should be thankful to the Russian people for what has happened, because at Russia's expense and suffering there has been made on a large scale an experiment in socialism that proves the extreme danger of introducing it under unfavorable conditions. The results of this experiment will save the rest of the world from similar experiments and similar sufferings. It seems to me that the conditions in Russia are already helping the American people to be more united and to win the War before undertaking to settle social problems.

And now what to do for Russia? There is only one answer: Help her. This help must be both practical and sentimental, economic and moral. It is quite clear to everybody who knows the Russian resources and the German ability to penetrate a country, that so long as the Allies permit Germany to stand with one foot on the Russian border, the victories of the Western front will be incomplete. You will have to twist the tail of the German in order to get relief on the Western front.

From our side, American help will show to the world that might is not right, and that, as we say, "God is not in force, but in the truth."

ASPHALT manufactured from domestic petroleum during 1917 amounted to 701,809 tons, valued at $7,734,691. Of this, California produced 220,294 tons of solid asphalt from 14 refineries, and 85,134 tons of liquid products. Asphalt from Mexican sources totaled 645,613 tons, worth $7,441,813. Imports were 187,886 tons, and exports 30,107 tons.

Preservation of Pit-Timber

In view of the importance of preventing wastage in pit-timber, the British Department of Scientific and Industrial Research has issued a bulletin in which Percy Groom suggests preventive and remedial measures against decay. He points out that the fungi, which are for the most part responsible for the decay, often clothe the surface of the wood with a fluffy or cotton-like material (spawn) which rapidly spreads, and also produces fructifications that emit spores which, conveyed through the air, may alight on and attack other wood. Colliery timbermen should be taught to recognize the spawn and fructifications, and, starting from the intake, and traveling with the air currents to the return ways, they should periodically inspect the timber. Every fructification should be removed by cutting away the portion of wood to which it is attached, and should then be placed in a pail, carried to the surface, and burnt. For dealing with the spawn the men should carry a swab, cloths, and a pail containing an antiseptic solution; the antiseptics suggested, in order of preference, are creosote and its various derivatives, zinc chloride, and copper sulphate, though the last should not be used where the mine-water is rich in iron. All the accessible wood should be washed with the solution, and the spawn removed. In this way the growth of spawn over the surface would be checked and its transference to other parts of the mine prevented. Preventive methods depend on rendering the wood immune to infection by fungi, through coating or impregnating it with the antiseptic.

ZIRCONIUM minerals are used chiefly as refractory material, which melts only at an extremely high temperature and is very resistant to the action of fluxes and slags. Zirconium fire-brick—made of a combination of zirconium oxide with a proper binder—promises to be extensively used. The fused oxide of zirconium expands so little on being heated that crucibles, muffles, combustion tubes, and similar articles made of it are not broken by sudden changes of temperature. Several alloys of zirconium have unusual properties. A zirconium steel is said to be particularly suited for making armor-plate, armor-piercing projectiles, and bullet-proof metal; a new patented alloy of zirconium with nickel, called cooperite, is extremely hard and is particularly well adapted for making cutting tools. Zirconium compounds are used also as incandescent material, as an opacifier in enamels, and in making paint and abrasives.

LITHOPHONE is now selling at 7½c. per pound, this price to rule until September. The manufacturers of lithophone experience difficulty in obtaining deliveries of crude barytes from mines in the Southern States. Domestic off-color barytes now command $22 to $24 per ton, and pure white floated $32 to $36.

ASBESTOS of domestic origin sold in 1917 amounted to 1683 tons, valued at $506,056, an increase of 13%.

The Ruth Flotation Machine

By ARTHUR J. HOSKIN

Machinery for concentrating minerals by oil flotation is of many designs. New schemes come to the attention of the public frequently. Every method is aimed to take advantage of the phenomena observed by each particular investigator.

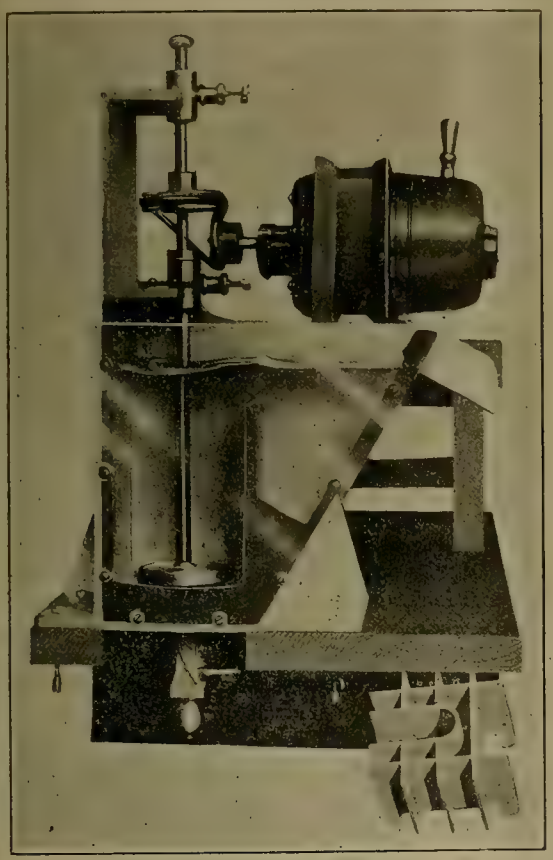


FIG. 1. OPERATING WITHOUT OIL

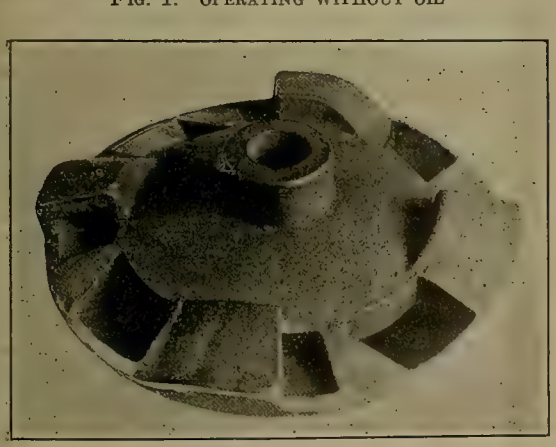

TOP VIEW OF AIR DISTRIBUTER

Oil flotation is not one process, but several. It is difficult to explain to a layman just what is meant by flotation. There are so many schemes, each founded upon a different principle or theory, that the flotation of minerals has become the work of technical specialists. After pioneers in this technical field had spent years in study,

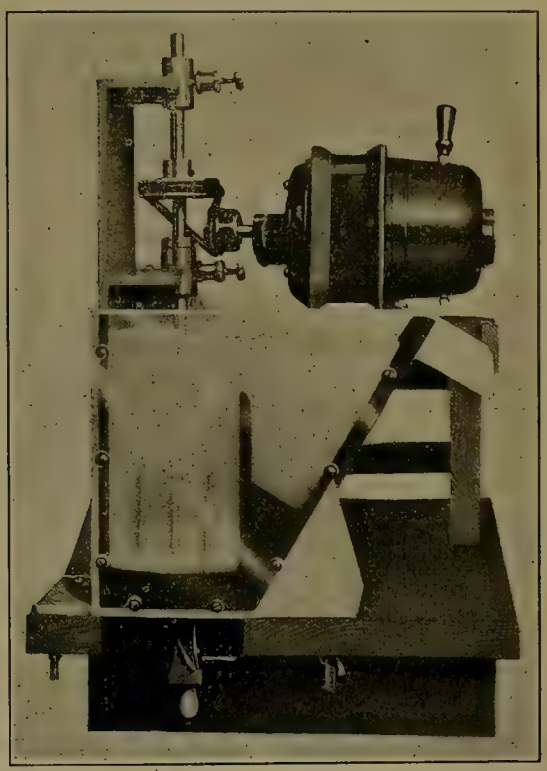

FIG. 2. OPERATING WITH SMALL AMOUNT OF OIL

development, and litigation, a student at the Colorado School of Mines, who had previously worked in mills, became so intensely interested in the process that he decided to make it his specialty. He equipped a private laboratory for research and he proved certain principles he had formulated. Finally he set about to design a machine to apply these principles commercially. This refers to Joseph P. Ruth Jr., of Denver.

The Ruth flotation machine was not put upon the market until its efficiency had been thoroughly demonstrated by long laboratory experimentation. Its inventor designed and built it to accomplish specific things.

He did not announce his findings immediately, but waited until he had proved, beyond all doubt, his ability to duplicate results with all the common sulphide ores upon a large scale. His experimental machine was constructed with transparent plate-glass sides that permitted him to closely observe phenomena occurring under varying conditions. He was rewarded by finding that his apparatus would carry out his theories. It remained for him to modify his machine so as to simplify its manufacture and render it thoroughly substantial under hard operating conditions.

Experimenting with the small laboratory device known as a bubble-tester, Mr. Ruth noted the familiar phenomenon of the adhesion of sulphide particles to bubbles of air. If a bubble be brought into contact with a stationary particle of the mineral submerged in pure water, the latter will affix itself thereto. Oil does not apparently enter into this attraction. The experiment is not a new one, by any means, but it had much to do with Ruth's further research. He next added tiny amounts of soluble oil to the water and found the same adherence of the mineral to the bubble—with this difference: the greater the proportion of oil dissolved in the water, the smaller the mineral particles that would adhere to the bubbles.

All his experiments up to this point were performed with stationary bubbles and minerals. He analyzed the actions of the various flotation machines then in use and took note of the fact that, almost without exception, flotation practices called for the agitation of minerals and bubbles so that there was considerable relative motion between them. The next step was to experiment again and to secure comparative results when both these elements are in motion relatively, when either one is at rest and when both move at the same speed in the same direction. The experiments demonstrated that the mutual attraction between bubbles and sulphide minerals remains constant under the varying conditions, but that the best attachment of the minerals to the bubbles takes place when there is the least amount of relative motion. This finding is in strict harmony with physical laws.

Another line of investigation covered the effect of varying the size and the number of bubbles. The result was simply the verification of the perfectly obvious surmise that the greater the number of bubbles in a unit volume of pulp, the less chance there is for a particle of mineral to escape attachment. A corollary to this is that there should be the greatest possible diffusion of the bubbles throughout the pulp.

Working along the lines suggested by such conclusions, Mr. Ruth devised an apparatus intended to accomplish two things, namely, to thoroughly aerate the pulp and to secure a minimum relative motion between bubbles and mineral particles. To attain these ends he hit upon two exceedingly simple devices. The chamber in his machine corresponding to the agitation compartment in other machines of this same general type (see illustration) is of uniform cross-section so that the pulp is a column ascending at a constant speed, the particles of ore and the bubbles rising at practically the same speed, thus securing the highest approximation to no relative motion between the two important sets of factors. The portion of his machine that takes the place of the agitator in a Minerals Separation unit is known as the 'gas-distributer.' Its purpose is neither to agitate nor to stir. It is a single casting in the form of a closed type of impeller. Air enters the machine through the hollow vertical shaft from above and is discharged through four hooded ports arranged upon the upper surface of this distributer. Simultaneously the pulp is drawn into the distributer from below and, passing through compartments wholly separate from those conducting the air, is discharged through four ports spaced between the air ports. The distributer, revolving at 270 r.p.m., causes an intimate association of the pulp and air as they emerge from the impeller and start traveling upward. This method of throwing the bubbles and the minerals upward simultaneously and at the same velocity obviates all countercurrents, with the consequence that the air-bubbles have an ideal opportunity to become loaded with mineral particles.

During his investigations, Ruth reached a conclusion that stands at variance with the beliefs held by the majority of flotation experts. This conclusion is that the use of oil in flotation has no bearing upon the wetting of the mineral particles, but that the prime function of oil is to so influence the physical consistence of the water as to cause it to become more thoroughly diffused with air-bubbles. He demonstrates this phenomenon with a small machine fitted with transparent plate-glass sides. If this be filled with pure clear water and the distributer be started, the water immediately becomes charged with bubbles of fairly large size, all rising in step with the water. A drop of oil is then added; as soon as it has time to dissolve and to begin issuing from the distributer, the water turns milky white, owing to the increase from relatively few large bubbles of air to millions of small ones. The photographs (Fig. 1 and 2) show this laboratory machine running at the same speed, and mixing precisely the same volumes of air during both phases of the experiment. Mr. Ruth states that any substance, whether it be common salt or any other chemical, that will cause a similar diminution in the size of the bubbles will work equally as well as oil in flotation.

The physics of this effect has not been satisfactorily explained. Ruth asserts that all oils are more or less soluble in water, some being wholly soluble while others dissolve to a very limited degree. It is the soluble portion of any oil, he believes, that indirectly causes the collection of the concentrate. This idea differs radically from the one generally accepted, but it seems proved by this simple experiment. If ore be fed to the machine after stable conditions have become established with a small amount of oil in the water, there does not appear to be any change in the number of bubbles per unit of pulp volume. Agitation tends to increase the solubility of any oil. There is a fixed proportion beyond which the amount of oil dissolved in the water becomes inefficient. The selection of an oil, then, depends primarily upon the type of machine used and the violence of agitation of the

pulp. With the Ruth machine, it is believed that all ores may be treated with equally efficient results if that particular oil be selected that will reduce the bubbles sufficiently in diameter without unduly oiling the water. Again, the gurden of ground ore in the pulp makes no difference in the number nor size of the bubbles. The bubbles should not be too minute or they will not be able to buoy the mineral particles that may become attached. If the slime can be caused to segregate into small masses by this sort of coagulation, these small masses will then be acted upon by the bubble precisely as though they were simple mineral particles and they will be floated and collected with the froth.

Success in treating any given ore in this machine dedepends primarily upon the use of an oil that will cause thorough aeration of the pulp and that will, simultaneously, give reasonable persistence to the bubbles after they rise to the surface and until they are skimmed. The least amount of oil that will make the water milky is just as effective as any greater amount. In fact, Mr. Ruth finds that the richer his liquid is in oil, the smaller the mineral particles that may be promptly floated. He therefore advocates a minimum amount of oil in the first cells—wherein it is desirable to collect the coarsest concentrate—and the addition of oil in succeeding cells to collect the slimy particles.

The accompanying drawings show the construction of the machine. Each cell has an aeration compartment and a settling-compartment or spitzkasten. The complete machine usually contains six such cells.

An automatic and uniform water-level is maintained throughout the machine by gates in the partitions between the aeration compartments, one lever adjusting all gates simultaneously to the same area of opening and thus regulating the forward travel of pulp. The discharge opening—at the end of the last cell—adjusts the height of pulp in all the cells. There are no pipes, valves, or floats.

The aeration compartment is of uniform cross-section from the bottom up to the lip of the overflow partition. A curved metal plate along the back of the compartment gently deflects the pulp-column toward the settling-chamber without modifying the velocity of the column. The froth is removed from the front of the machine by paddle-wheels. Launders may be arranged to retain a separate concentrate from each cell or to blend the six concentrates in any desired combinations.

The commodious passage from the bottom of the settling compartment back to the foot of the distributer affords free and rapid circulation of the pulp. It is claimed this machine will not clog if it be shut down for any reason in the midst of a run, no matter how long the delay. The large passage-way for the pulp combined with the powerful suction of the distributer soon clears the lower part of the machine of any compacted pulp. The distributer, which is less than 13 inches in diameter, ordinarily runs, as stated, at about 270 r.p.m. and consumes less than one horse-power.

The Ruth machine is not of the agitation type, such as those of the Minerals Separation or Janney, nor is it of the pneumatic type, as exemplified in the Callow cell. Its claims for patent were so distinct as to be promptly allowed. The patent, No. 1,268,630, issued June 4, 1918.

This machine was given its first working trial in the Newton mill at Idaho Springs, Colorado, where it was installed to handle the tailing from older units of concentrating machinery. It proved effective in recovering quantities of minerals that had previously run to waste. Unfortunately, from our point of view, the Newton is a custom-mill that treats ores upon a tonnage basis, the clients being satisfied without requiring assays of the tailing and, in consequence, no records of efficiency have been kept. In the Phoenix works, at Denver, a six-cell machine has been running several months on low-grade molybdenite ore from Pitkin; it has made a clean concentrate and a clean tailing.

Cost of Mining Supplies in Mexico

During 1917 the Amparo Mining Co. at Etzatlan, State of Jalisco, treated 84,277 tons of silver-gold ore. The following comparative statement will give some idea as to the general increase in cost of supplies, in United States currency:

Article	1912	1917
Dynamite, case	$9.90	$17.80
Cyanide, pound	0.18	0.88
Mining steel, pound	0.11	0.28
Fuse, thousand feet	3.93	7.95
Caps, hundred	0.46	1.74
Carbide, pound	0.06	0.07
White iron, pound	0.005	0.03
Coke, ton	20.00	70.50
Lumber, thousand feet	40.00	120.00
Nails, pound	0.07	0.18
Round and flat iron, pound	0.04	0.14
Cruciform steel, pound	0.11	0.30
Steel plates, pound	0.06	0.19
Steel shafting, pound	0.08	0.16
Crucibles, No. 300, each	21.00	64.88
Battery shoes, each	10.00	27.00
Battery dies, each	8.00	17.50

A Consular Report dated April 16 at Tunis, northern Africa, gives the following statistics of ore production in Tunisia during 1917: There was extracted 41,400 tons of lead, 15,000 tons of zinc, 606,000 tons of iron, 5800 tons of manganese, 1,000,000 tons of phosphate rock, and 32,700 tons of lignite, representing a value at the quay of over 67,000,000 francs ($13,400,000). These excellent yields would have been better if the phosphate mines had not been hindered by difficulties of exportation.

Zinc-ore producers of the Komspelter region have been trying to increase the consumption of spelter by substituting it for other metals. It was hoped that the Standard Oil Co. would be able to make gasoline cans of sheet zinc, but it was found that zinc could not be soldered by machinery. A new soldering fluid has been devised to overcome this difficulty.

The Menace to Gold Mining

The gold miners of the world are of one accord in demanding that means be found for relief from the hardships entailed by the excessive cost of labor and supplies. The movement is by no means confined to the United States. On July 4 a meeting of leading gold-producers of the British Empire was held in London, on which occasion it was recommended that the Government should arbitrarily increase the price to be paid for the metal. The same idea has been advanced in this country. Sir Lionel Phillips, chairman of the Central Mining Corporation, ascribed the shrinkage in the output of gold to the inability of the mine-owners to meet the increased cost by a compensating adjustment of the selling price. This view conceives that gold is a mere commodity, and takes no account of its position as the standard of reference for the values of other articles of commerce. The American Mining Congress has offered several suggestions, including the exemption of the industry from taxation, the remission of freights on the supplies needed, exemption of the employees from the draft, and the payment of a bonus. The California Metal Producers' Association has endorsed the plan for paying a bonus, proposing $10 per ounce as the minimum, in addition to the regular rate of $20.67. It is claimed that a bonus of $10 would re-establish the earning power of the mines on about the same level as that existing before the War. Another suggestion made by the American Mining Congress was to remove the embargo upon the exportation of bullion so far as related to new gold produced in this country, in order to admit of taking advantage of any opportunity to dispose of it abroad at a premium. This ignores the primary object of accumulating a larger reserve in the United States as a basis for expanding credits, in consideration of which the Secretary of the Treasury has been insistent that gold must be treated as a war-essential. His letter to Mr. Sulzer, which has been widely copied, was based on the importance of augmenting our stock of gold in order to make it easier to sustain the obligations of the Government. Unless a large reserve is available serious difficulties may arise as the bonds and notes of the Treasury become multiplied.

Commenting upon the importance of gold as the foundation of finance, Hennen Jennings testified, at a hearing before the Committee on Ways and Means of the House of Representatives, with reference to the new revenue bill: "I have been connected, in different capacities, with gold mining—between 30 and 40 years—in California, Venezuela, South Africa, England, and Montana, and have examined mines in Mexico and Alaska, and am conversant with difficulties and cost of producing gold. I have given much time and thought to the article on 'The gold industry and gold standard,' which I believe contains much that is pertinent to your inquiry and which I beg to put in evidence.* My aim is to show that the gold industry differs from all other industries in that it is impossible for it to obtain any excess profit during this war period; but, on the contrary, it is proportionately burdened as the price of other commodities used in its obtainment advance, and as long as the integrity of the gold standard is maintained by this and other countries. The advantages of upholding the gold standard should and do rest with the countries that produce the most gold and hold the greatest reserves. We hold the greatest reserves. Great Britain and her colonies and dependencies produce 62.6% of the gold of the world; the United States, second, with 19.3%, while within the territories of the Central Powers less than 1% is mined. The production of the gold of the world was at about a standstill for some years before the War. It is now on the down-grade. Our Liberty bonds are pledges in gold. How can they be redeemed, or faith and belief in them kept up, if gold outputs are allowed to dwindle, while the bonds multiply manyfold? Gold is no mere luxury; it is a necessity for the credit and financial unity and strength to the Allied countries. It is thus vital that gold mining should be encouraged as far possible and burdened as little. Gold mining has more or less pioneered the other mines of the world, and the modernness of mining can be appreciated by the statement that the output of gold during the last 18 or 20 years, of copper in 15 years, of petroleum in 11 years, have equaled all that was produced since 1800; and probably the output of mines in the last 20 or 30 years of the world of all the fundamental minerals—that is to say, iron, coal, copper, petroleum—has been greater than in all history. This has resulted in the great modern activity of industry, because mining has produced the requirements and the raw materials that have aided man to manufacture force. It has been a power for the service of man equal to between two and three billion men's muscular work. I make this little preface to show you the part that gold and mining generally have played in the industrial world. I have already spoken of the gold output of the warring nations. The greatest goldfield of the world at the present time is the Witwatersrand in South Africa. . . . Although this goldfield has cheap labor, and coal in proximity, the dividends from the producing mines do not amount to over 22% of the whole output.† Therefore the margin of profit is not so very great. From the statistics of gold production in the United States for the years 1914, 1915, 1916, and 1917, it will be seen that the

*This article appeared in our issue of May 11, 1918.

†In 1917 the output was worth £38,323,921, and the dividends £6,718,604.

bulk of the output has not come from the phenomenally rich mines, but from those of moderate yield and comparatively low grade, such as the Homestake and the Alaska Treadwell mines.

The inquiry in Committee, following Mr. Jennings' preliminary statement, is reproduced in part:

MR. RAINEY: What is it that gives gold its money-value? The fact that it is valuable in the arts, the fact that it is valuable as jewelry, and desirable on those accounts has given it its value from almost the beginning of time, hasn't it?

MR. JENNINGS: That gives it its stress value.

MR. RAINEY: It has been always the precious metal of the world?

MR. JENNINGS: Yes, sir.

MR. RAINEY: How much is an ounce of it worth?

MR. JENNINGS: $20 and a fraction. I have forgotten.

MR. RAINEY: Now, certainly in the world there has developed a precious metal [iridium], valuable in the arts, more valuable in the arts than gold, more valuable than gold or any other metal in chemistry, which is worth per ounce, we will say, eight or nine times as much as gold. Is not that metal now the precious metal of the world?

MR. JENNINGS: It is more precious; yes, sir.

MR. RAINEY: Do you know what the value of iridium is now?

MR. JENNINGS: No; it changes so rapidly.

MR. RAINEY: It can't change in this country any more, because we have placed a value on iridium of $170 an ounce.

MR. JENNINGS: Iridium is found in connection with platinum. That is worth $105 an ounce.

MR. RAINEY: We have just placed $105 the value per ounce on platinum.

MR. JENNINGS: Yes, sir.

MR. RAINEY: Do you know what the value of palladium is per ounce?

MR. JENNINGS: No, sir.

MR. RAINEY: We have just placed a value of $130 an ounce on that. They are worth more than gold now. They are the most precious metals in the world. We can't fight wars without them. They are used in so many ways that that gives them, inasmuch as this is a world war, a still added value. I want to present this question to you for consideration. I don't know whether you will be able to answer it now, but you will be in the record. Germany controlled nearly all the world's supply of platinum, palladium, and iridium until 1901, and until the War broke out she was the controller of the American supply, which came from the Ural mountains, and so on until the outbreak of this war. It doesn't exist any more. Russia produced 80% of these metals, which are the most precious metals in the world, and Germany controls the supply in the Ural mountains. If, after the War is over, Germany should still continue to be a large manufacturing country and still retain control of these three precious metals and should monopolize these metals—one of which is worth over nine times as much as gold, what effect would it have upon the gold standard in the world?

MR. JENNINGS: In the first place, I don't think simply the preciousness of gold makes its utility as a standard. Over-preciousness would make it impracticable, and over-preciousness is the trouble with platinum and iridium. There isn't enough to act as trading counters.

MR. RAINEY: The Russians have never developed the Ural mountain supply as the Germans will develop it?

MR. JENNINGS: No; it is a very small amount in quantity compared to the output of gold throughout the world. The universality of gold shows that it is appreciated as to its reasonableness, and in this table it is shown that gold is mined in 60 different countries. Therefore, its universality and its not over-preciousness is in its favor.

MR. RAINEY: It has always been the most precious metal in the world until the last two or three years?

MR. JENNINGS: No; platinum has always kept even with gold—at least, as a rule.

MR. RAINEY: But we never realized its value as we do now.

MR. JENNINGS: We need it for special purposes, I grant you, but it isn't simply precious.

MR. RAINEY: Do you know about the world's supply of platinum—the world's stores of platinum?

MR. JENNINGS: My memory is not clear on that. It is comparatively a small number of ounces. I shouldn't think it would amount to—I don't like to guess, but it is very small compared to gold. I can get you an accurate figure from the Bureau any time you like, but I have an idea somewhere in the neighborhood of 100,000 ounces.

MR. SLOAN: Platinum became valuable largely when electricity and lighting came into vogue, did it not?

MR. JENNINGS: Yes; it has been used for a good many purposes. We are using it in the production also of nitrogen.

MR. SLOAN: For the last half-century platinum has run almost parallel with gold—its value?

MR. JENNINGS: Yes, sir.

MR. SLOAN: But this is true, in urging its use for a good many purposes. It don't burnish like gold, it is not as desirable for the vision as gold, and it yields to certain acids (anything that has lead in it), so that it may be lost in a very short time?

MR. JENNINGS: It is really more valuable in the arts now for electrical purposes, and chemical purposes, and in laboratories—and it is very useful.

MR. SLOAN: It has an element of preciousness in not being in quantity enough to make it bulky.

MR. JENNINGS: Yes, sir. I have tried to make the point that the basis of money is faith; there is no reality to money beyond an inducement to workers to produce; the production of the worker. Gold has, by its very history, extending over so many years, and being regarded as the counter of value by the human race, has inbred a belief in its value. It has been supported in that belief very curiously by almost the constant diffi-

culty of attainment that nature has demanded for her gold, efforts from man equivalent to the value man has placed upon gold as a trading-counter. Therefore its great reality is the basis of work of hand and brain to get it. You just read some of our prospectuses of sanguine gold miners, and you would think that gold would flood the world, but it hasn't.

MR. SLOAN: Do you know any important section of the globe where the existence of gold has been excluded by careful research?

MR. JENNINGS: No, sir; I do not at the moment.

MR. SLOAN: It is found in every State in the Union, is it not?

MR. JENNINGS: In small quantities. Platinum, unfortunately, we produce but very little of it. We save some platinum in connection with our dredging operations in California. It is obtained in cleaning up the gold, but I think it is but a very small per cent. Among other places where it is found is Colombia, in South America, and it is more encouraging there than any place outside Russia. Russia, as has been stated, is the great supplier of platinum.

MR. SLOAN: Yes; in the Ural mountains, but the very limited bounds of production or area of platinum would exclude it being a standard for the world, wouldn't it?

MR. JENNINGS: Yes, sir.

MR. SLOAN: And its value would also exclude its feasibility of being handled.

MR. JENNINGS: Yes, sir.

MR. SLOAN: And it must have some weight—some general indestructible weight, and pass in the laboratory. Platinum will stand more heat. It will yield to the fumes quicker than gold. Isn't that true?

MR. JENNINGS: Yes; it is quite indestructible as a whole.

MR. SLOAN: Yes; I quite agree with you about its general indestructibility.

MR. RAINEY: The world's production of gold in 1916, from your interesting compilation, amounts to $457,000,000.

MR. JENNINGS: Yes.

MR. RAINEY: The world's production of platinum, 89,000 ounces.

MR. JENNINGS: Eighty-nine is it?

MR. RAINEY: Yes; 89,000 ounces. At the present value of platinum that would be worth nearly $100,000,000.

MR. JENNINGS: Yes.

MR. RAINEY: Therefore before the War, that is, on the basis of 1916 output, and the present platinum value, the value of gold mined in the world is only four times the value of platinum mined in the world, so the difference isn't so great after all in value.

MR. JENNINGS: You say 100,000 ounces.

MR. RAINEY: No; roughly it is worth $100,000,000 at the present time.

MR. JENNINGS: Isn't it $10,000,000?

MR. RAINEY: The world's production of platinum is about 90,000 ounces.

MR. JENNINGS: It is $10,000,000, I think.

MR. RAINEY: I am just guessing at this.

MR. JENNINGS: Figures are getting so colossal these days it would be very easy to get them wrong. I think I am prepared to come to the point you wish me to come to, as to the taxation of gold.

MR. RAINEY: Yes; it is about $10,000,000. I was mistaken.

MR. OLDFIELD: How much with respect to the curtailment of production do you estimate the present tax of the law?

MR. JENNINGS: It is very difficult what to say. There are so many factors in it. It depends on the locality.

MR. OLDFIELD: Would that be involved in placer mines?

MR. JENNINGS: Yes, sir; in all classes of mines. Some of them are just on the verge of profit, and some of them are making liberal profits. So gold mining, no matter how rich it is, as I hope I have shown, can't make an excess profit during this war. It must make a loss during the period compared to what existed before the War, and that is the reverse of most any other commodity. I think there is this difference: If we could do, which is a very difficult matter, you want to raise revenue, and I appreciate that, but you also want to get the maximum amount for your revenue you raise. If under present conditions, the real standard is the difficulty of obtaining gold, and we are having inflation of values which the governor (which is a governor) is not sensitive but takes time to adjust, it will in the end lower issues of gold $2 certificates where we ought to be issuing them for $1 for prices that existed before the War. And as we get back that lower price, so automatically will the gold mines be encouraged to go on. They will be shriveled up and stopped if the price is advanced beyond certain limits. If prices go up that way, we are pledging our credit unnecessarily. If we could bring lower prices in certificates and gold—I think it is not only a simple matter of one or two gold corporations, but it is a matter of great public concern demanding the thought of our best financiers—this gold production and gold standard.

MR. RAINEY: And if gold is valuable on account of its preciousness and value, it occurs to me that iridium, palladium, and platinum might make a desirable monetary metal after the War on account of its value and scarcity; and if iridium is worth nine times as much as gold, if Germany should make gold a secondary metal, as we used to have silver the secondary metal, the ratio would only be then about 1 to 9 in order to make platinum the precious metal and give gold the ratio of silver we used to have when it was 16 to 1. So I think the question is worthy of your consideration to make a study of the standards.

MR. JENNINGS: Yes, I will look into the question further. But it isn't simply the question of preciousness of gold that I am urging at all. For instance, if you want simply the preciousness of material we have diamonds which per weight is so much more precious

than iridium, and yet you wouldn't think of diamonds as a standard.

MR. RAINEY: It wouldn't be desirable as a medium of exchange because of the difficulty of handling and coining it.

MR. JENNINGS: Yes. What we want is a medium of exchange. The great usefulness of gold exchange seems to me is that it is understood in so many different parts of the world, and the difficulty of obtainment is big, and it is taken in one country and another on the basis of weight and purity, owing to the certificate of coinage, simply on the weight and purity; but its ductility makes it easy of coinage. It is much easier to coin than platinum. The difficulty of platinum is it would not be as easy to coin as gold and it has a great many qualities of appealing to mankind as a counter of exchange that has taken place so many hundreds of years. Of course, I think we cannot ignore that the precedents of history have given a preference to gold."

The above colloquy reveals an indeterminate state of the legislative mind regarding the gold standard and regarding the general principle of a monetary standard. The disposition to consider a change in the measure of value because we are suffering from top-heavy credits as nations at war have suffered in the past, is surprising. To question the standard of exchange at such a period is to unsettle finance and invite commercial chaos; it resembles the proverbial error of attempting to swap horses while crossing a stream.

The conditions in British Columbia are as severe as in the United States, as shown by the report of the Minister of Mines for 1917, the production of gold having steadily declined within the past three years. The comparative figures are as follows:

	Placers		Lode-mines	
	Ounces	Value	Ounces	Value
1915	38,500	$770,000	250,000	$5,167,934
1916	29,021	580,500	221,932	4,587,334
1917	24,800	496,000	114,523	2,367,190

In view of the closing of the Rossland mines, and of the fear that many gold properties in the Province may be forced to suspend operations, the Minister of Mines has approved the recommendations of the Northwest Mining Association, at its recent meeting at Spokane, Washington. The resolutions adopted there were the following:

"That all war taxes be remitted in-so-far as they affect gold mining.

"That the present advance in freight rates be abrogated in respect to the gold mines that are unable to operate at a profit under the present rates.

"That commercially inaccessible gold properties of merit be made accessible through the building of motor roads.

"That the gold-mining industry be placed on the same basis as other war industries in respect to financial assistance, to be extended through the War Finance Corporation or by means of re-discounts through the Federal Reserve Bank, or through any other means that may be devised.

"That operators of gold properties be given a government guaranty, instead of a bonus, which guaranty shall assure to gold-mine operators profits commensurate with those that would have accrued to them under the pre-War conditions and prices of labor, supplies, taxes, and other items of general expense.

"That any and all acts of the Government directed to the financial aid of the gold-mining industry, as above set forth, shall be subject to the examinations, reports, and recommendations of properly qualified mining and accounting experts acting on behalf of the Government.

"That copies of these resolutions be forwarded to Secretary McAdoo and to the senators and representatives of the various mining States."

In California the stress under which the gold miners are operating is greater than in many other parts of the world, owing to the low grade of the ore. In the Grass Valley district the average recovery is about $7 per ton, which is far above the average for the State. In the Mother Lode counties it is only $4.19, and these mines produce 46% of the total output of California. During the first six months of 1917 the Californian gold production amounted to 89,830.307 oz., and during the corresponding period of the present year it has declined to 66,668.039 oz. One large dredge at Carrville, Trinity county, built two years ago at a cost of $400,000, has been obliged to cease operating, and other dredges will soon stop working. The difficulties in California are aggravated by the regulations of the Debris Commission for the impounding of tailing by dams, which are costly to build and maintain. Some modifications of these requirements are deemed advisable under the existing circumstances. The hydro-electric power companies have also shown a disposition to restrict the use of current in gold mining, owing to the large demand at higher rates from other industries. The mining companies pay 0.8c. per kw-h., while power for commercial purposes sells at 1.2c. The total power-distribution for 1917 amounted to 584,225,935 kw-h., for which the average rate paid was 1.859c., and the anticipated consumption for 1918 is 642,648,529 kw-h., for which an average return of 1.797c. per kw-h. is expected. It is comprehensible that the power companies would prefer to serve the customers that pay a higher rate, but if gold mining should be declared definitely and unequivocally to be an essential industry no discrimination could be made, and the rates established by the State Railroad Commission would apply. The interest displayed by the Secretary of the Treasury in the production of gold undoubtedly will lead to action by the War Industries Board to place the gold mines on the priority list, and legislation by Congress in aid of the industry is to be expected.

IRON-ORE SHIPMENTS from the Lake Superior region during June totaled 9,921,860 tons, an increase of 281,869 tons when compared with that month of last year. Shipments to July 1 in 1918 and 1917 were 18,949,730 and 16,135,135 tons, respectively. This movement took place through the Sault Ste. Marie lock and canal, which passes the largest tonnage of any waterway in the world.

Magnetic Properties of Manganese and Special Manganese Steels

An elaborate study of this subject was made by Robert Hadfield, C. Cheneveau, and Ch. Geneau and published recently in the Proceedings of the Royal Society of London. To find the connection between the magnetic susceptibility per unit mass (called the mass susceptibility) of different manganese steels and their chemical constitution, measurements were made with the help of the magnetic balance of P. Curie and C. Cheneveau. In this instrument the body to be tested is attached to one arm of a torsion balance and is brought into a stronger and stronger field of a horse-shoe magnet moved horizontally at right angles to the line joining the poles. The observed deflection of the torsion balance increases at first, then diminishes. If the magnet be moved still farther, a deflection in the opposite direction is observed, which again passes through a maximum at the point where the variation of the field of force is greatest. The difference between the readings of the torsion balance when the deflections are greatest on either side is proportional to the mass susceptibility, so that this quantity can be determined by comparison with a specimen whose susceptibility is known. All specimens were enclosed in glass tubes of different shapes, generally with very thin walls. They gave an inappreciable deflection in the most intense magnetic fields, even when the balance was at its greatest sensibility, that is, when the platinum wire was the thinnest procurable. The use of this glass, the search for which entailed great trouble, was exceedingly advantageous; it did away with the necessity for correcting for the magnetic effect of the envelope. The standard adopted for comparison was anhydrous $CoSO_4$, for which $X = +58 \times 10^{-6}$ at 20°. For pure powdered manganese prepared from manganese amalgam $Y = 11.0 \times 10^{-6}$ at 18°. Manganese is paramagnetic, whatever its condition. The ferro-magnetic properties which it possesses after being melted or deposited by electrolysis are without doubt due to occluded H_2. The presence of occluded gases should not be neglected when examining the magnetic properties of metals or alloys prepared by melting. The mass susceptibility of special manganese alloys, which varies between -17 and -259×10^{-6}, is independent of the magnetic field, and these alloys are paramagnetic. For manganese steels X is only slightly influenced by the amount of manganese present, but depends considerably upon the carbon content and generally increases as the ratio C/Mn diminishes. If the ratio is constant the addition of other metals always increases X. An increase of nickel from 2.57 to 19% increases X in the ratio of 23:67. An increase of 0.74% tungsten increases X in the ratio of 18:29. An increase of 3.5% chromium raises it 10%. For copper, in spite of its diamagnetism, 2.25% in a Mn-Ni steel raises X by about 19%. All of these steels were quenched in water from 1050° and were all of the paramagnetic austenitic type. The addition of 6% silicon to a manganese steel where C/Mn = 0.01 makes the steel much more ferro-magnetic. A secular change in the magnetic properties of this steel has also been observed, the specific magnetism increasing, in a period of several years, from the order of 4 or 5% of that of pure iron up to nearly 50%.

Determination of tungstic acid in wolframite is the subject of a paper by Luis Gugliamelli and Ulaus Hordh, in the 'Anales de la Sociedad Quimica de Argentina.' Inconsistent and unsatisfactory results were obtained with various methods for the detection of tungsten in wolframite. The precipitation method originally described by Treadwell (precipitation of tungstic acid with HNO_3) is not quantitative for this purpose, and is subject to losses of 8 to 10% or more; the filtrate from this precipitation was always found to contain an appreciable amount of tungsten, the color reaction being due to the formation of lower blue oxides by the action of nascent H from HCl and Zn. The method more recently described by Treadwell, that is, the fusion of the mineral with Na_2CO_3, extraction with hot H_2O, and treatment with concentrated HCl, failed to give better results. The same was true of the Berzelius method by fusion with alkali and final precipitation with $HgNO_3$. Incomplete precipitation of tungstic acid by treatment with a mineral acid (HNO_3 or HCl) is due to silicic acid, which is always present in wolframite; this reacts with the tungstic acid to form soluble silico-tungstic complexes which are only slightly hydrolyzed by acids under the conditions of analysis and are not destroyed by repeated evaporation with HNO_3 nor even by heating to 130° C. The Berzelius method is also inaccurate because the mercury salt of the silico-tungstic acid formed is rather soluble in warm, slightly acidulated H_2O. The G. von Knorre method was employed in the following manner, and was found to give satisfactory results. The mineral was decomposed by fusion with Na_2CO_3, the aqueous solution obtained therefrom was neutralized with HCl (methyl orange indicator), 10 cc. tenth normal H_2SO_4 was added and the tungstic acid was precipitated at the ordinary temperature by an addition of an excess of benzidine-HCl solution; SiO_2 (after ignition) was eliminated by evaporation with H_2SO_4 and HF. The filtrate was free from tungsten. Satisfactory results were obtained when the method was applied to pure, crystallized sodium tungstate and tungstic acid. All of the above methods are satisfactory for the analysis of compounds, such as pure sodium tungstate. The G. von Knorre method alone is recommended for detection of tungstic acid in minerals such as wolframite and scheelite, which contain silicic acid. This method has the following advantages: The formation of the silico-tungstic complex at ordinary temperatures is practically nil and consequently the amount of SiO_2 so obtained is so insignificant as to require no separation in most cases; the formation of the silico-tungstic complex has no appreciable influence on the separation of tungstic acid, and the precipitation of benzidine silico-tungstic is quantitative; and after incineration the SiO_2 present, from decomposition of the silico-tungstate, may be eliminated readily and the total content of WO_3 may thus be obtained.

REVIEW OF MINING

LEADVILLE, COLORADO

Manganese Developments.—Railroad to be Torn Up.

M. L. Buchanan and associates, who have formed one of the largest combinations of manganese producers in the district, have added to their former holdings by securing a lease on the A. V. shaft in California gulch, near the south end of Harrison avenue. A short period of development, in which the surface plant was repaired, the shaft re-timbered to a depth of 400 ft. and prospecting carried ahead on the 400-ft. level, has resulted in the discovery of a large body of ore assaying 35% Mn. Five carloads have been shipped to various Eastern markets as trial lots. An air-compressor and drills are now being installed, and the output will soon be increased greatly.

The manager of the Dold Mining Co., C. J. Dold, has just returned from Denver, where he purchased equipment for the Newell shaft, which will be re-opened. The shaft will be equipped with a steam-hoist, motor-driven compressor, and drills. A large reserve of high-grade manganese is now exposed in the property. A good deal is being extracted from the Northern.

Lessees at the Hibschle shaft, south-east of the Northern, recently found a deposit of iron and manganese, carrying 8 oz. silver per ton. Ore is being shipped regularly to the Colorado & Ohio plant at Salida.

At the Chrysolite property on Fryer hill, lessees have opened a body of silver-iron ore assaying 46% iron and 5 oz. silver. An output of 20 tons daily is being maintained, and preparations are being made to double this output. A new standard-gauge siding is to be constructed to the property this month.

The decision just reached by A. E. Carleton, president of the Colorado Midland Railroad, who was recently appointed receiver for the line by Judge J. W. Sheafor of Colorado Springs, to junk the 250 miles of trackage and all equipment, is regarded with considerable anxiety in Leadville. Much of the switching to the mines is being done by the Midland, whose lines extend to many of the properties along California gulch and on Rock hill. It has also, in connection with the Colorado & Southern, handled the ores from the Penrose and Bohn properties in the Down Town area. Just what the result of closing the road will be has not been fully estimated, but it will undoubtedly work a great hardship on a number of local operators.

REVELSTOKE, BRITISH COLUMBIA

Northwest Mining Convention Meeting: Prospecting, Geology, Taxation, and the Smelter Dispute.

The annual Northwest International Mining Convention which was attended by delegates from Washington, Idaho, and Montana, as well as the Provinces of Alberta and British Columbia, was held at Revelstoke on July 8, 9, 10, and 11. It was one of the most important assemblages of its kind when the attendance, the high standard of addresses, and the general discussion are considered. The enthusiasm was sincere, and the citizens of Revelstoke furnished the visitors splendid entertainment. One of the features of the opening session was the occupancy of the chair by Mrs. Ralph Smith, the first woman member of the legislature of British Columbia, and the first of her sex to preside over the deliberations of such an organization.

Alex. McRae was chairman of the executive committee in charge. The remainder of the personnel was: W. J. Coulthard, vice-chairman; F. B. Hill, secretary; L. A. Howson, assistant-secretary; K. G. McRae, treasurer; with W. A. Anstie, H. McKinnon, B. R. Atkins, A. Johnson, W. R. Grubbe, M. H. Lister, and W. A. Sutherland, the last being

MAP OF BRITISH COLUMBIA, SHOWING MINERAL AREAS

the member of the legislature for Revelstoke. A mineral exhibit was on view, consisting of specimens from practically every known British Columbian mining centre; while the Consolidated Mining & Smelting Co. contributed a special display of the products of its Trail smelter. T. O. Bibb was in charge of the exhibit.

A. G. Langley, Provincial resident mining engineer for the Revelstoke district, gave the first address, the subject being 'Discovery and Development of Prospects.' He said that the district had been prospected for gold, silver, lead, and other minerals to some extent, but there was much to be accomplished. He reviewed mining activity from the 'eighties in the Big Bend, Trout Lake, Ainsworth, and other centres. Emphasis was laid on the importance, when good ore was found, of thoroughly prospecting the adjacent ground. Valuable hints were given to aid the finding of ores peculiar to the Kootenay region.

Bruce White, of Sandon, chairman of the Western Section of the Canadian Mining Institute, discussed 'Geology and Mineral Resources of the Revelstoke District.' Declaring

that there were more geological formations in this part than in any other of British Columbia, he said that even tin was found in pegmatite rock on the headquarters of McDougall creek. This pegmatite was an altered granite and quartz mixture and was of the pre-Cambrian age. Tungsten was likely to be found in this vicinity or might be associated with the tin in the form of scheelite. In the Trout Lake district manganese-iron was identified; while molybdenite was found in several places along the Arrow lakes, in the altered-granite formation. Little work had been done on them. The Big Bend country, north of Revelstoke, had been well known for over 50 years, its placer mining having first brought it into prominence. The speaker referred briefly to the Trout Lake and Lardeau district and its mineral riches, and concluded by expressing the opinion that the Revelstoke district possibilities were not realized, and that all that was necessary to bring about valuable results were men and capital.

The Hon. John Hart, Minister of Finance, took for his text 'Taxation, as it Affects the Mining Industry.' He reviewed the taxing of mines from 1896 to the present time, and concluded by saying that "it was hardly necessary for him to repeat that the Government is determined that taxation shall not interfere with the progress of mining in this Province.

R. Randolph Bruce, of the Paradise mine, Windermere, followed with an acknowledgment of the courtesy and consideration given the representatives of the mining industry by the Government in discussions on taxation.

On July 10, S. G. Blaylock, of Trail, assistant general manager for the Consolidated Mining & Smelting Co., gave an interesting address on 'The Part Played in the War by the Trail Smelter.' He spoke of the development of the lead and other departments of the smelter since the outbreak of war, and stated that facilities had been provided for reducing all the ores of the Province.

A. B. Clabon, president of the Vancouver Chamber of Mines, took for his subject 'The Value of the Mining Industry.' In the afternoon the Hon. W. Sloan, Minister of Mines, delivered a spirited speech entitled 'British Columbia, the Mineral Province.' He traced the development of mining in this Province from 1848, when the Hudson's Bay Co. first mined coal on Vancouver island. Since then, $170,000,000 worth of coal has been dug, also $80,000,000 from lode mines in the last three years. California's mining had produced $37 per capita, while British Columbia yielded $115 per capita. The Government had assisted the prospector. He disapproved of the 2% tax, favoring taxation on the net income of the mines. The Government was encouraging development of the iron-ore resources.

'Northwest Kootenay' was the title of an address by Orville Young, of Golden.

F. A. Starkey, of Nelson, president of the Eastern British Columbia Associated Boards of Trade, addressed the convention on Thursday morning, his subject being 'Closer Co-operation Between Boards of Trade and Mining Organizations.' He regretted the lack of a better understanding between the mine-owners and the Trail smelter.

A prospectors' luncheon was held, nearly 100 delegates parting. This was unique and appetizing, the menu calling for bacon, beans, and bannock.

In the absence of Thomas French, manager for the French Complex Ore Reduction Co., Nelson, his paper on 'Some Notes on the Smelter Situation in British Columbia' was read by F. B. Hill, the convention secretary. A vigorous address, strongly protesting against the evils of the 'smelter trust', was delivered by Sidney Norman, editor of the 'Northwest Mining Truth', and representative on this occasion of the Spokane Chamber of Commerce.

J. J. Warren, of Trail, president of the Consolidated Mining & Smelting Co., whose address was entitled 'Some Smelting Problems Under War-Time Conditions', summed up the difficulties with which the company has had to contend, and warmly defended its management against statements made by some of the speakers. He spoke of the difficulty of finding labor, of the increased cost of production for various reasons—among those cited being coal strikes, which restricted operations—and of the problem of fixing smelting rates. In regard to the latter he instanced the inability of the mine operators to supply the lead demand of the winters of 1916 and 1917, as a result of which an effort had to be made to meet the demand from the American side. When, however, war needs were satisfied, the smelter found itself without a market, and, the lead market having collapsed, the company had a surplus on its hands. Shortage of clean lead ore in British Columbia for smelting purposes was the great difficulty. He resented the suggestion that the company was not treating the mine operators fairly. If it were to be subjected to Government regulation the same action should be taken with saw-mills and flour-mills. The smelter was ready to treat lead at $1 over cost which, he believed, was a better rate than was quoted by any other smelter on the continent.

Charles F. Caldwell, of Nelson, president and manager of the Utica Mines and president of the Kootenay Mine Owners Association, outlined the claims of the mine-owners of the Kootenay district with respect to smelting rates, and asked for the sympathy and support of the convention and the boards of trade of British Columbia.

In closing, the convention considered the following resolution, in addition to passing those of the usual formal character: "That insomuch as the Consolidated Mining & Smelting Co. is treating custom ores and may be considered a public utility, a Royal Commission be appointed to investigate and regulate treatment and smelter charges, guaranteeing fair and equal treatment to all producers." It was decided, on amendment, to defer action pending consideration of the matter by the Associated Boards of Trade.

SAN FRANCISCO, CALIFORNIA

Status of Gold Mining.—Metal Output in 1917.

The State Mineralogist, Fletcher Hamilton, has issued a circular to gold producers, in which he desires particularly definite facts relative to the difficulties encountered due to economic conditions arisen since 1914, as follows.

1. Increased costs of supplies, equipment, etc.; labor; power; and total.

2. Statement as to decreased efficiency of labor and decreased labor supply; also causes for same.

3. Effect on development of ore-reserves; and on prospecting.

4. Ratio of decrease in gross gold production; also in tonnage of ore mined (exact figures would also be helpful).

5. Effect of new taxation.

6. Effect of increased freight rates; of delays (if any) in receiving orders for supplies and equipment.

7. Percentage of decrease in dividends.

The U. S. Geological Survey, through Charles G. Yale, of the local branch, has issued advance figures of mine production of metals in 1917. There was a total of 3,003,250 tons of ore treated, yielding gold worth $20,087,504, 1,775,431 oz. of silver, 48,153,139 lb. of copper, 21,868,628 lb. of lead, and 10,872,716 lb. of zinc, all valued at $37,685,985. The comparative figures for 1916 were $21,410,741, 2,564,354 oz., 55,897,118 lb., 12,407,493 lb., 15,256,485 lb., worth $39,749,263. Lead was the only metal that showed an increase. This nearly all came from San Bernardino county. The Mother Lode in Amador county yielded 804,875 tons of $4.55 gold ore. Nevada county produced 480,869 tons averaging $7.65 per ton.

THE MINING SUMMARY

ALASKA

Iditarod.—In Bulletin 655 (162 pages) of the U. S. Geological Survey, the Lake Clark-Central Kuskokwim region is described by P. S. Smith. Exploration of this region traversed a field almost unknown, therefore its results replace nearly a complete blank in knowledge of the geography and geology of Alaska. Geologic work was hampered by absence of bedrock over wide areas. Few mines or prospects are being developed in the region. Iditarod is

MAP SHOWING SITUATION OF LAKE CLARK—CENTRAL KUSKOKWIM REGION

the nearest active district. Gold placers have been worked at many places adjacent to the area, but only on five creeks in the Lake Clark drainage basin. The only gold lodes being prospected lie north-west of Lake Clark and at Candle creek. Quicksilver has been reported at several places in the Kuskokwim basin. Copper occurs near Iliamna lake and near Lake Clark. Antimony is found with mercury on the Kuskokwim and near Iditarod; none has been developed. Silver-lead ore has been opened south of Iliamna lake; molybdenite in small quantities west of the north end of Lake Clark, and manganese in the same area. Each of the mineral resources is described as far as possible, and may be of service to prospectors and others who might investigate the region.

ARIZONA

Crown King.—This is one of the resurrected districts of Arizona. From the 'seventies to 1915 the mines experienced many ups and downs. In the latter year D. B. Gemmill and M. P. Randolph leased the Crown King mill and started treating the tailing dump. A system of flotation was applied that recovered 1540 tons of zinc concentrate and 1500 tons of iron-gold-silver concentrate, from 12,000 tons of tailing. These products were sent to the smelter at Humboldt. The old mill was overhauled. The Arizona Power Co. extended its lines to the mill, also the Wildflower and Tiger mines. An aerial tram was erected between the former mine and the mill, which at present is dressing 60 tons daily of $12 gold-silver and $3 copper ore. Recovery in 1917 was 91%. The Tiger mill was remodeled. Old tailing has been treated since February 1918, and will not be worked out until September. It carries 12 oz. silver per ton, also some gold. Concentrate assays 200 oz. silver and $8 gold. Recovery is 70%. The Bradshaw Development Co. has certainly made this district 'come back.' Other mines are the Springfield, Lincoln, Swastika, and Nelson.

Globe.—Arizona Commercial pays 50 cents per share on July 31. This is equal to $87,500.

Jerome.—Owing to the labor situation being investigated by the Federal mediator, Hywell Davies, wages here were not advanced 50c. as was done at other Arizonan copper centres. The Central Labor Union has asked for a flat increase of $1.10 per day for all classes. After hearing committees from all sides and investigating the problems put up to him, Mr. Davies went to Los Angeles, where he has been in consultation with Charles W. Clark, general manager for the United Verde Copper Co. It is said that matters affecting the providing of suitable and cheaper places of abode for the employees of the district will be the principal topic taken up at this conference.

Calumet & Jerome is to prospect by drilling on the 600-ft. level. The Diamond Drilling Co. will do 2000 feet.

United Verde Extension is said to have experienced a good deal of trouble in blowing-in its new furnace. Two charges 'froze' last week.

Mayer.—Five miles east of this place is Copper Mountain, where a considerable amount of development is being done. At 500 ft. below the main adit-level in the Copper Queen a wide vein has been found.——The Arizona Binghampton mill is treating 175 tons daily, with high recovery.——The Copper Mountain company's shaft is down 250 ft., and will be deepened to 500 ft.——Rich ore has been opened at shallow depth by the Big Bug Copper Co. Indications point to a probable large deposit.——A 50-ton flotation plant is being erected by the Pocahontas.——There are six new deals pending for well-located properties in this district.

ARKANSAS

Harrison.—The 75-ton mill of the Harrison M. & M. Co. was burned last week. It was under lease to the Continental Mining Co., and will be re-built.

CALIFORNIA

Angels.—The new vein at 3200 ft. in the Utica mine is said to be opening well, assaying $10 per ton.

A considerable quantity of chrome continues to be shipped from deposits in the serpentine belt a few miles east and south-east of Angels.

Coran.—The First National Copper Co., controlling the Balaklala company, will pay a dividend of 15c. per share in

August. This is No. 4, making a total of $570,000. The mine is shipping 200 tons of ore daily to the Mammoth smelter at Kennett. Profits are $17,000 per month.

Engelmine.—The Engels Copper company has built 40 cottages for employees, is erecting 8, and has let a contract for 70 more. The company is looking after the welfare of its employees in a commendable manner. The daily output of concentrate is three carloads.

Grass Valley.—The Allison Ranch mine is being unwatered to the 900-ft. level. Pumps are working at 700 feet.

The North Star company received a new rope weighing 9 tons for its main shaft last week.

Keswick.—The Mountain Copper Co. is shipping 800 tons of ore daily over the railroad from the Iron Mountain and Hornet mines. This is almost normal, notwithstanding the labor shortage, which has caused all development to be suspended. The company's enlarged flotation plant at Minnesota station will be completed in about a month.

Pittsburg.—The Commissioner of Corporations has authorized the National Metals & Chemical Co. to issue 995 shares in exchange for a plant and its equipment to be used for the reduction of ores by the use of mechanical and chemical processes. The company also will extract precious and other metals from ores and manufacture nitric acid by the fixation process.

Redding.—On July 16, 1500 miners, smelter-men, and laborers in the Shasta County copper belt were notified that wages were advanced 50c. per day by the four companies—Mountain Copper, Mammoth Copper, Bully Hill Mines, and Balaklala Copper. The voluntary increase was given by the companies after a conference of the general managers, following the raise in price of copper to 26c. Under the new schedule, miners and machine-men will receive $4.50 for an eight-hour day, and shovelers $4.

An agreement between the California State Highway Commission and the U. S. Department of Agriculture has been signed whereby the Redding-Tower House Federal post road will be started as soon as bids can be secured. This important highway will be built with an expenditure of $105,334 by the Federal government, and approximately a similar sum derived from the sale of State bonds of the $15,000,000 issue. The new road will open up an important mineralized area, with deposits of chrome and other ores.

Winthrop.—The Bully Hill mines are expected to yield 250,000 lb. of copper per month for the remainder of this year. Development on the 900-ft. level of the Star shaft is said to be very good. The first unit of the flotation plant will be ready in September. It is planned to treat the complex ore for zinc, copper, gold, and silver. So far this year—four months—13,646 tons of ore has been treated, yielding 1,623,591 lb. of copper, 2623 oz. of silver, and 449 oz. of gold. Walter Arnstein and associates are operating the group under a bond on which a large payment was made at the beginning of the year. R. L. Beals is general manager.

COLORADO

Boulder.—The Rare Metals Co. at Rollinsville is concentrating tungsten ore carrying as low as 1% WO_3. There is said to be a good deal of this grade in this and the Nederland district.

Cripple Creek.—The Cresson company reports that the Roosevelt drainage-tunnel will be connected with the mine during the next 40 days. An important discovery was recently made in the Cresson drift of the tunnel, when 11 ft. of ore was opened. With the connection of the tunnel, development on the lower workings of the mine will be resumed, as it will clear out the bad air, which has been retarding operations. While there have been substantial discoveries of new ore in the mine, no additions to ore-reserves have been made since April.

Ouray.—The Mountain Top mine in the Sneffles district is producing carloads of ore that return between $5000 and $6000 net. It is said that the farther this property is developed below the zone of rhyolite flows that cap the andesite the richer the silver content of the veins.

Pueblo.—The Princess Annie Copper Mining & Development Co. is driving two tunnels in the Sangro de Christo range, 15 miles south-west of Westcliff. No. 1 tunnel has a vertical depth of 150 ft. on ore, and No. 2 a 350 ft. vertical depth on ore assaying gold 0.8 oz., silver 10 oz., and copper 15%. Ira Severns is general manager.

Rico.—This district has prospects of having a custom mill. Matt. Chestnut, one of the leading local men, and a Denver company, have purchased a mill-site, and plans for the building are under way. Although the ores are low grade, they are excellent for smelting, carrying a large amount of lime in addition to iron. Some of the ore carries zinc, and concentration should produce a high-grade shipping product. The lack of a custom mill has been a serious handicap to development of the district.

Telluride.—Ore and concentrate shipments from this district in June totaled 94 cars, 30 less than a year ago. This does not mean a reduction in output, as the Liberty Bell is reducing everything to bullion instead of sending out concentrate. Water in the Smuggler mine curtailed production.

IDAHO

Mullan.—The Copper King M. & S. Co. has developed a large shoot of lead-silver-copper ore, and contemplates erecting a concentrating plant this summer. L. F. Hayes is superintendent.

Salmon.—The Drilling Development Co., owning a large property on an intrusive porphyry dike on Carmen creek in Lemhi county 13 miles east of Salmon City, will shortly be a gold and silver producer. The company has just arranged a contract with the Koering Cyaniding Process Co. of Salt Lake City for three recovery-drums, equal to 200-ton capacity. The mill includes a roasting plant followed by the Koering system. The three drums will be ready for shipment in 60 days, and it is expected to have the mill operating early in October. Extensive development work has been done and a large tonnage of ore blocked, averaging $7.75 gold and silver per ton, with fairly high zinc content and some lead. The precious metals will be extracted first, and tailing assaying enough zinc will be impounded for further treatment; this also will be by the Koering system. This company has offices at Butte. Guy W. Stapleton and Phil T. Dunn, of Butte, Montana, and C. W. Sherwood, of Salmon, Idaho, are the main owners.

Wallace.—Dividends paid by companies in the Coeur d'Alene during the second quarter of 1918 are as below:

Hercules	$ 750,000
Bunker Hill & Sullivan	490,500
Consolidated Interstate-Callahan	232,495
Hecla	.....
Caledonia	234,450
Federal, (common)	209,757
Tamarack & Custer	106,574
Total	$2,023,776

Tamarack & Custer is earning $50,000 net per month. The mine and mill are operating with full complement of labor.

KANSAS

Galena.—Drilling on 29 tracts in this field shows a deep 'run' of zinc ore, that is, from 179 to 465 ft. depth.

MISSOURI

Granby.—The American Z. L. & S. Co. is building a high smokestack to prevent lead fume from annoying the residents.

Joplin.—Production of the region last week was 7574

tons of blende and 940 tons of lead. These averaged $56 and $97 per ton, respectively. The total value was $514,714, of which Missouri contributed $129,779. For 28 weeks the total is $13,149,952.

MONTANA

Butte.—The U. S. Bureau of Mines rescue-car finished a week of training miners and works employees on July 13. Over 100 men attended the first-aid classes.

Anaconda is sinking the shaft in its Original mine 500 ft. from the 3400-ft. level. This will be the deepest in the district.

The Butte & Superior company and employees subscribed $180,000 to the third Liberty Loan. Employees in the Service now number 169.

On July 30 Butte Copper & Zinc pays an initial dividend of 50c. per share, equal to $205,850. The Emma mine, worked on a 50-50 basis with the Anaconda company, produces 250 tons of 'pink' manganese daily, also 150 tons of zinc ore.

NEVADA

Ely.—Nevada Consolidated has advanced wages 50c. per day, effective July 1.

Goodsprings.—On the 700-ft. level of the Yellow Pine mine an immense orebody has been exposed. An electric-air drill is doing good work at 900 ft. depth.

Tonopah.—Ore production of the district last week was 10,237 tons valued at $174,029. June outputs were:

Mine	Tons	Silver, oz.	Gold, oz.	Profit
Belmont	8,985	110,439	1,120	$61,032
Extension	10,533	129,774	1,210	67,307
Jim Butler	2,210	.....	....	29,829
Tonopah Mining	13,950	103,926	1,028	34,460
West End	....	105,353		....

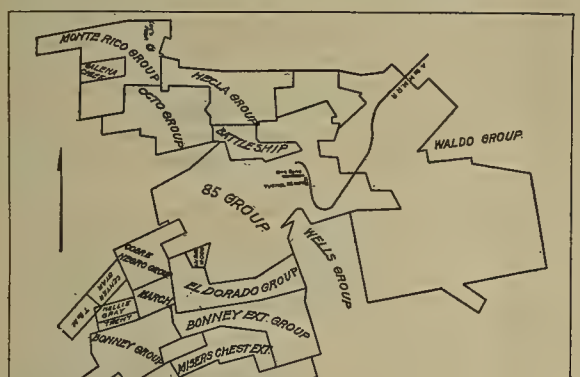
The Extension profit is $27,580 more than in May. This is due to the Murray and Merger veins at a depth of 1680 feet.

The Nevada-California Power Co. has completed a transmission-line to the Divide district. Interesting development continues at all of the new mines there.

NEW MEXICO

Hurley.—The old Lone Mountain district, 1¼ miles west of here, deserted for 25 years, is again receiving attention.

Lordsburg.—The 400-ton mill of the Eighty-Five Mining Co., employing gravity and flotation methods of concentration, has recovered 90% in its first month's run.



PROPERTY MAP OF LORDSBURG DISTRICT, NEW MEXICO

The Bonney mine is shipping ore regularly to Douglas, Arizona. This averages 4 to 9% copper, $6 gold, and $3 silver per ton. The 500-ft. level is opening well.

The Atwood, adjoining the '85,' is being re-opened by H. V. Snell and others of Globe. The 300-ft. shaft is to be sunk to 1000 ft. W. H. Tangye is in charge.

The Hecla company is preparing to start work on its claims three miles south of Lordsburg. R. E. Van Druff of San Diego, California, is president.

The old Last Chance mine, eight miles south, has been acquired by Pittsburgh people. B. Prescott of the Bonney and '85' companies will supervise the work.

Some high-grade gold-silver-lead ore is to be shipped from the Caesar Brock mine, 20 miles north of here.

Motor-trucks are to carry fluorspar from the mines at Redrock to rail at Lordsburg. It is intended to ship 65 tons daily.

Development at the Last Chance mine here is reported to be encouraging.

Magdalena.—The Buckeye Copper Co., sinking a shaft 10 miles east of this place, has opened rich sulphide ore at a depth of 150 feet.

Pinos Altos.—The Calumet-New Mexico Mining Co. is erecting a 100-ton mill here to concentrate zinc-lead-silver-gold-copper ores. The Langston mine was recently acquired containing 18,000 tons of ore.

Santa Fe.—According to the State Tax Commission, mines in 10 counties last year produced ores and coal worth $1,050,224, but the cost was $1,348,162, making a loss of $297,938. The returns show the following:

County	Value of ore	Loss	Profit
Colfax (ore)	$7,970,009	.....	$2,562,667
Dona Ana (ore)	897	$2,903	.....
Grant (ore)	25,877,370	.....	13,860,164
Grant (ore)	285,628	47,189	.....
Luna (ore)	17,770	.....	2,534
Lincoln (ore)	18,834	4,614	.....
McKinley (coal)	601,566	206,035	.....
McKinley (coal)	899,573	.....	138,095
Otero (ore)	119,783	.....	15,995
Otero (ore)	47,171	7,976	.....
Rio Arriba (ore)	8,677	.....	2,457
Socorro (ore)	2,211,107	597,396	.....
Taos (ore)	2,243	43	.....
Torrance (ore)	8,484	.....	3,443
Torrance (ore)	7,621	905	.....

OKLAHOMA

Picher.—Production of the districts last week was 5321 tons of blende and 654 tons of lead, valued at $374,365.

At the White mine, three ball-mills have been put in, one to take the overflow from the two rougher-jigs, one to take the tailing from the sand-jigs, and one to take the middling from the first tables. After being ground the pulp is once more sent over the tables. The manager, W. J. Borries, states that before the mills were used, tailing assayed 2½% blende, since reduced to 1½%. This mill also has a flotation plant at work.

UTAH

American Fork.—The new mill at the Bellerophan mine is at work. Ore-reserves are estimated at 10,000 tons, assaying $25 per ton.

Gold Hill.—The Western Utah Copper Co. is to build a 100-ton concentrating plant for its 2% ore.

Oakley.—Twenty miles from this place in Summit county, and two miles from the Idaho and Nevada borders, the Bipont Silver Mining Co. has taken a $250,000 bond and lease on 56 claims. It is said that over 100,000 tons of rich silver-lead ore is available. The company's capital is $100,000. J. B. Randall of Oakley is secretary. A mill is to be built to concentrate 15-oz. silver and 12% lead ore.

Park City.—To connect the Judge tunnel with the Daly West shaft over 500 ft. has been driven. The daily progress is 13 ft. The Daly West mill is to treat old tailing.

The Naildriver mine is said to be opening encouragingly.

Salt Lake City.—More than 1000 employees of the Magna and Arthur plants of the Utah Copper Co. on July 17 discussed the wage question, and to take action regarding the increase of $1 per day, which they now ask of the company, and of which 50c. has been granted. A request is to be presented to R. C. Gemmell, general manager for the company, advising him that the men still asked an increase of $1 per day, with time and a half for Sundays and holidays. The alternative is that the matter be taken up with the War Labor Board at Washington and the State Industrial Commission.

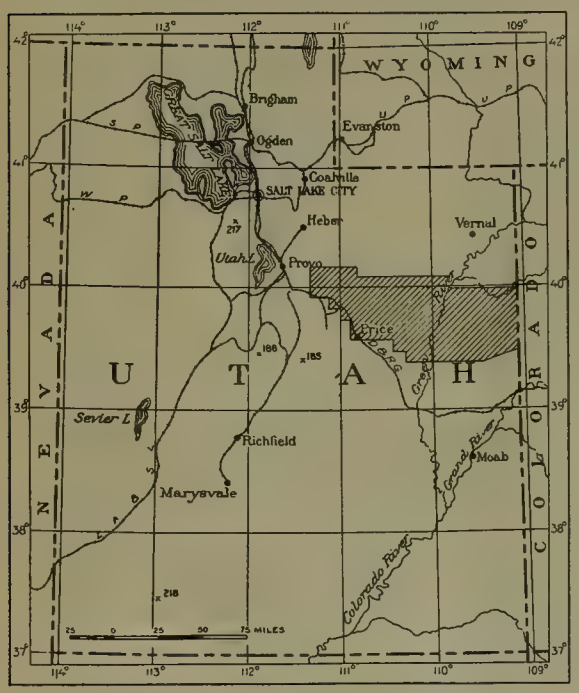
Tintic.—Dragon Consolidated paid 1c. per share, equal to $18,750, on July 25. This makes $56,750 for 1918, and $131,250 to date.

Iron Blossom also paid 2½c., equal to $25,000, on July 25. This makes $3,150,000 to date.

The Chief Consolidated has declared a dividend of 12½c. per share, payable on August 3. This amounts to $110,530, making $287,370 for 1918, and $1,124,341 to date.

The railway that was to be built into the West Tintic district has been delayed indefinitely due to present conditions. This will handicap development and production from a number of mines.

Two U. S. Geological Survey Bulletins—No. 690-C and



PART OF UTAH, SHOWING THE UINTA REGION

691-B—dealing with the Uinta region, have just been published. The first described a geologic reconnaissance of the Uinta mountains, with special reference to phosphate; this is by A. R. Schultz. The area lies in northern Utah along the Uinta mountains. The north side of the field can be reached by wagon from Rock Springs, Green River, or Evanston in Wyoming, on the Union Pacific, a distance of 40 to 80 miles. From the west end of the range the route is by way of Provo on the D. & R. G. Another route starts from Park City. There are two routes from the south: (1) by stage from Price or Vernal to Myton, then by private conveyance 65 miles farther; and (2) from Colton on the D. & R. G. by stage to Duschene, then 40 miles by private outfit. The area is sparsely inhabited. The phosphate rock, the more massive of which is found as float, resembles a dark coarse granular limestone, which might be mistaken for a dark fine-grained basalt or very fine sandy conglomerate. There were 37 samples taken during the examination, varying from 9.09 to 67.47% tri-calcium phosphate. There is a large quantity of rock available. Lack of transportation facilities is the chief obstacle to development of this necessary fertilizer, but construction of the Moffat line from Craig, Colorado, to Salt Lake City will bring it within a few miles of rail.

The second publication by D. E. Winchester discusses oil-shale of the Uinta basin of north-eastern Utah. The evidence to hand indicates that shale may be present beneath a great part of the basin, and the Utah portion is estimated to contain 42,800,000,000 bbl. of crude shale-oil and 500,000,000 tons of ammonium sulphate as a by-product. Railroads and wagon-roads are scarce.

CANADA

British Columbia

Princeton.—The Canada Copper Corporation, operating the Copper Mountain mine near here, also the Mother Lode near Greenwood, and a smelter at Greenwood, reports as follows for 1917:

Net earnings from the Mother Lode and Lone Star mines were $152,690. Due to fuel shortage the smelter worked more or less spasmodically, and reduced 30% less ore than in 1916. The Mother Lode continues to yield 600 tons daily, and can do this for a considerable time. In 1917 the 181,189 tons averaged 0.917% copper, 0.17 oz. sliver, and 0.038 oz. gold per ton. The Lone Star yielded 4780 tons, assaying 1.94%, 0.14 oz., and 0.026 oz., respectively. Its future is not bright. The smelter yielded 4,247,316 lb. copper, 46,356 oz. silver, and 9592 oz. gold.

At Copper Mountain, development and diamond-drilling continued to prove previous estimates, according to the consulting engineer, Allen H. Rogers. Reserves are 10,000,000 tons assured and 2,000,000 tons probable, averaging 1.74% copper and 20c. per ton in precious metals. The main haulage-level, to connect with the upper workings, was started on October 10, 1917, and finished on March 12, 1918. It is 2903 ft. long, 10 by 11 ft. in finished section. Other preparatory work is under way, all of which will be ready before the new mill, some time late in 1919. In a 50-ton mill 3000 tons was treated and a flow-sheet prepared for the large plant. Lawrence Addicks advised on concentrate treatment, which will include nodulizing and reduction in blast-furnaces. The mill is to be 9 miles from the mine and 4 from Princeton. The Kettle Valley Railway Co. is building a 13-mile line, and the Okanogan Power Co. a 100-mile transmission-line. There was spent at Copper Mountain in 1917 the sum of $622,720. Oscar Lachmund is general manager, and F. S. Norcross Jr., superintendent of mines.

Grand Forks.—Granby Consolidated has advanced wages to all employees at its smelter 25c. per day, from July 1. The men now receive $1.25 above normal wages, which are based on copper at 16c. Although the metal has been 23½c. for the past year the company has paid its men on a basis of 24c. copper.

Slocan.—Gneissic-galena ore from this district was examined by W. L. Uglow and discussed in 'Economic Geology' of a recent issue. Orebodies are fissure veins and replacements in schists, quartzites, and finely-crystalline limestones (Slocan series), and in the Nelson grano-diorite, and are usually within 3 or 4 miles of the contact. Most important deposits are fissures cutting the Slocan slates. In these veins the gneissic, or banded, galena ore is found. It is the characteristic lead ore of the district, although all of it is not of banded texture. In the Standard mine near Silverton, galena is especially abundant in this form. Ore-

zone in this property nas been developed by over 16,000 ft. of drifts through a vertical depth of over 1200 ft. Walls of lode are usually smooth and slickensided, evidence of considerable differential movement. Ore minerals occur in lenticular masses varying in extent, as much as 25 ft. thick. Between lenses is argillaceous material, containing stringers and irregular bunches of ore and gangue. Characteristics of the lodes suggest that the fracture-zones in which they occur have been subjected to considerable shearing, and that the individual lenses or sulphide masses were originally part of a more or less continuous vein that paralleled the direction of the fracture-zone. Some gneissic-galena ore has been found in the Interstate-Callahan and Minnie Moore mines, Idaho.

Trail.—The Consolidated M. & S. Co.'s smelter received almost similar quantities of ore during the first half of 1918 and 1917, as under:

Month	Tons, 1917	Tons, 1918
January	36,570	27,404
February	40,967	33,989
March	42,949	41,725
April	25,909	37,029
May	15,969	21,162
June	15,969	21,162
Total	172,493	179,274

Trail.—The Consolidated M. & S. Co. is to give its employees 15c. per day extra in May, and 25c. from June to November 1.

Victoria.—The annual report of the Minister of Mines of British Columbia for 1917 has been issued. It is the first to contain reports from the District Mining Engineers who were stationed in different parts of the Province during the past year. Figures of production prove that the preliminary estimate published months ago were very close, the estimated production being $37,182,500, against a definitely established total of $37,010,392.

Ymir.—The Hobson Silver-Lead company, operating the Yankee Girl mine, is considering the erection of a concentrating plant. Present daily shipments of silver-gold ore are 50 tons. W. T. McDowell is manager.

Ontario

Cobalt.—The Buffalo Mines report for the year ended April 30, 1918, shows that the revenue was $831,286, of which $264,282 was profit. Current assets total $677,175, and liabilities $32,061. The report of the superintendent, T. R. Jones, shows that there is 13,989 tons of 17-oz. ore broken in the mine, also 3000 tons of material in old stopes. There is no developed ore, although pillars will yield some. On dumps is 6000 tons of 11-oz. ore, also 100,000 tons of 6-oz. tailing. The mill treated 28,481 tons of ore and 88,534 tons of tailing, yielding 729,298 oz. of silver. The refining plant for treating flotation concentrate was abandoned, and arrangements made with smelters to handle this product.

Porcupine.—The Porcupine-Crown company is opening one of the best ore-shoots in its mine at a depth of 1110 feet.

The United States Patent Office at Washington desires us to call attention to the need for technically-trained persons for the examining corps of the Patent Office. Men are desired who have a scientific education, particularly in higher mathematics, chemistry, physics, and French or German, and who are not subject to the draft for military service. Engineering or teaching experience in addition to the above is valued. The entrance salary is $1500. Examinations for the position of assistant examiner are held frequently by the Civil Service Commission at many points in the United States. One is announced for August 21 and 22. Details may be had upon application to the Commission at Washington or to the Patent Office.

PERSONAL

Note. The Editor invites members of the profession to send particulars of their work and appointments. This information is interesting to our readers.

H. C. Hoover is in London.

Waldemar Lindgren is at Bingham, Utah.

C. W. Walters has enlisted in the U. S. Navy.

Arthur W. Stevens has returned from Nicaragua.

Gelasio Caetani is now a Captain in the Italian army.

G. F. Sever, of Washington, D. C., is at the Stewart hotel.

Forrest Marshall is at the St. Francis hotel from Victoria, B. C.

James F. Kemp has gone from Tulsa, Oklahoma, to New York.

J. M. Boutwell passed through San Francisco on his way to Arizona.

F. A. Beauchamp has gone to the Ohio Copper company's mill at Lark, Utah.

L. D. Ricketts was in San Francisco on July 20. He is now at Warren, Arizona.

Herbert G. Thomson, of Rochester, Nevada, is taking a short holiday in San Francisco.

Leslie Brown, of the Consolidated Gold Fields staff, is now a Lieutenant-Colonel, with the D. S. O. He has returned to London from East Africa.

A. Winter Evans, general manager of the Consolidated Goldfields mines at Reefton, New Zealand, and known in the United States, was killed in France recently.

Alfred D. Flinn, secretary to the United Engineering Society, addressed the engineers of San Francisco on July 23 on the subject of 'The Engineering Council.'

O. R. Whitaker of Denver, Colorado, has been retained by the Canadian government to assist in investigating smelting charges in British Columbia, particularly at Trail.

G. H. Parsons, chief chemist for the Ray Consolidated Copper Co. at Hayden, Arizona, has resigned and enlisted in the Gas Defense Service at Astoria, Long Island, New York.

G. F. Coleman, superintendent of the Noble Electric Steel Co.'s smelter at Heroult, has resigned to accept the position of manager of ferro-alloys for the United States Steel Corporation.

H. R. Edmands, who has been active in improving the precipitation of gold from cyanide solutions by charcoal in Western Australia, has gone to the Globe & Phoenix mine, in Rhodesia.

D. H. Angus has resigned as general manager for the Tough-Oakes Gold Mines Ltd. of Kirkland Lake, Ontario. He will retain the management for the Right of Way Mines Ltd. at Cobalt.

Oliver W. Krull, formerly of the metallurgical staff of the Chino Copper Co., later associated with the mining department of the Compañia Minera de Peñoles at Ojuela, Durango, Mexico, is now superintendent of the same company's lead smelter and white arsenic plant at Mapimi, Durango.

W. L. Cole, general manager of the Mountain Copper Co.'s interests in Shasta county, has resigned, having been with the company since it commenced operations at Keswick and Iron Mountain, 23 years ago. **Morton J. Murphy**, assistant general manager, will succeed Mr. Cole. **E. L. Stenger** will succeed Mr. Murphy.

The Australasian Institute of Mining Engineers has 582 members, of whom 119 are in the Service.

THE METAL MARKET

METAL PRICES

San Francisco, July 23

Aluminum-dust, large and small lots, cents per lb.	65—70
Antimony (wholesale), cents per pound.	15
Copper, electrolytic, cents per pound, in carload lots.	26.00
Copper, electrolytic, cents per pound, in small quantities.	27.30
Lead, pig, cents per pound.	8.30— 9.30
Platinum, Government price, per ounce.	$105
Quicksilver, per flask of 75 lb.	$120
Spelter, cents per pound.	11
Zinc-dust, cents per pound.	17½

ORE PRICES

July 23

Antimony, 45% metal, f.o.b. California, per unit.	$1.10
Chrome, 38 to 48%, California, per unit.	$1.25—$1.50
Fluorspar, 85% CaF_2, f.o.b. shipping point, or San Francisco (Woods, Huddart & Gunn), per ton.	$22—$30
Magnesite, crude, California, per ton (nominal price).	$7.00—$8.00
Manganese, domestic, 35 to 54%, f.o.b. South Chicago, per unit (Government price, effective May 29).	$0.86—$1.30
Manganese, domestic, 35 to 54%, f.o.b. east of South Chicago, per unit (Government price, effective May 29).	$1.01—$1.45
(Manganese, domestic, penalty of 50c. to $1 per ton for 8% and up to 25% silica, and bonus of 50c. to $1 for less than 8 and 5%.)	
Molybdenite, per lb., 90% MoS_2.	$1.25
Pyrite, per unit of sulphur, cents.	28
Tungsten, 60% WO_3, California, per unit.	$20—$24

EASTERN METAL MARKET

(By wire from New York)

July 23.—Copper is unchanged. Lead is quiet, though strong. Spelter is dull and easier.

SILVER

Below are given official (not Government) quotations, in cents per ounce of silver 999 fine. In order to make prompt settlements with smelters and brokers, producers allow a discount from the Government price of $1, hence the lower price. The Government has not fixed the general market price at $1, but will pay this price (as from April 23, 1918) for all silver purchased by it. The equivalent of dollar silver (1000 fine) in British currency is 46.65 pence per ounce (925 fine), calculated at the current rate of exchange.

A Chinese customs publication gives the following figures on imports and exports of treasure during the last calendar year, in Haikwan taels ($1.08 U. S. average during 1917):

Gold

	Bars, dust, etc.	Coin	Total
Imports	711,036	13,160,742	13,871,778
Exports	4,700,424	324,151	5,024,575

Silver

	Bars and sycee	Coin	Total
Imports	16,197,966	11,309,326	27,507,292
Exports	33,080,586	15,409,804	48,490,390

These figures show a net import of gold amounting to 8,847,203 Haikwan taels, and a net export of silver amounting to 20,983,098. These respective totals, calculated at the average value of the tael given above, are equal to about £1,909,000 ($9,130,000) and £4,530,000 ($21,700,000). Although other factors enter into the composition of the large exports of silver, the contrast between the movements of the two metals certainly indicates that the Chinese consider gold cheap and silver dear, at the prices current during the period, according to Samuel Montagu & Co. of London.

COPPER

On September 21, 1917, the Government fixed copper prices at 23.50c. per lb. for large lots, and 24.67½c. for small lots, effective until June 1, 1918. On this date the prices were re-fixed until August 15; but on July 2 the price was increased to 26c. and 27.30c., respectively, until August 15. Quotations in cents per pound are as under:

ZINC

Zinc is quoted as spelter, standard Western brands, New York delivery, in cents per pound. On May 25, 1918, the Government fixed prices until September for grade A spelter at 12c. per lb. for itself and the open market. Lower grades can make their own prices as usual. Sheet-zinc is fixed at 15c., and plate at 14c. per pound.

QUICKSILVER

The primary market for quicksilver is San Francisco, California being the largest producer. The price is fixed in the open market, according to quantity. The Government is taking 40% of the United States quicksilver output, paying therefor $105 per flask. Outside of this business the competitive market can make any price as usual. Prices, in dollars per flask of 75 pounds:

ORES (New York)

Antimony: Quotations are nominal at $1.10 to $1.25 per unit.

Ferro-manganese: The blast-furnace report of 'The Iron Age' for June, revised, shows the June output of domestic ferro-manganese, including electrolytic, to have been 29,568 long tons, and spiegeleisen 16,398 tons.

Molybdenum: The market is quiet at $1.25 per pound of MoS_2, and a small business is reported. There has been inquiry from foreign buyers.

Tungsten: The market has been active with considerable high-grade ore sold. Scheelite has sold as high as $24.50 per unit. Low-grade ore brought $18 to $22. Demand for nearby pure ores is strong. Ferro-tungsten is unchanged at $2.40 per pound of contained tungsten.

The alien property custodian, A. Mitchell Palmer, announced on July 22 that he had taken over the business of L. Vogelstein & Co. and Beer, Sondheimer & Co., metal merchants of New York City.

Eastern Metal Market

New York, July 17.

There is a scarcity in most of the metals, and all prices are strong. Demand in several is urgent.

Copper is quiet at the new Government maximum price.

Tin is extremely dull, but quotations tend upward.

Lead is firmly held at levels agreed upon by leading producers, but is scarce.

Zinc is not active, but quotations, while a little lower, are regarded as firm.

Antimony is quiet and unchanged.

The meeting in New York between the steel producers' committee and the Director of Steel Supply on Monday resulted in no agreement as to steel rail and other prices under discussion and referred to last week. While only 100,000 tons of rails are needed for 1918 the Railroad Administration wants the price fixed principally because of the large purchases to be made for 1919. The stand taken for a $42 price for bessemer rails is in the face of an average cost of $50 or more and the contention of one producer that he should have $60 for bessemer and $65 per ton for open-hearth rails. It now looks as though essential war-needs will absorb practically all of the open-hearth steel output of the country for this year, and that whatever is permitted for general purposes must be filled wholly with bessemer steel. Plate mills are producing at a yearly rate of 6,000,000 tons, while new capacity may bring the rate up to 7,000,000 tons by January. Tin-plate production continues at a record rate.

COPPER

The question of adjustments of various kinds, growing out of the sudden change in the price of copper on July 2, is the uppermost topic in copper circles. Consumers who have manufacturers' material to furnish on contract, and who based their contracts on the old 23.50c. price, find themselves in a serious position. There have been meetings of certain large brass and wire makers to discuss this phase of the problem and to find some way to present their side to the Government. As to contracts entered into between May 31 and July 2 at 23.50c., it is probable that producers will fill these at the old price where deliveries have not been made. Government and Allies' supplies seem to be a different matter. It is stated that there was no general agreement with them and that some orders were taken and some were not. Attention is directed to another difficulty in the case of manufacturers who enter into contracts on the basis of 23.50c. and did not cover their needs for copper. Encouraging reports of raw copper in June are coming in. In general the market is very quiet and not much is being contracted for at the new price of 26c. per lb. The fixed maximum for jobbing lots of 5 tons or less is 27.30c. per lb. The question of the price to obtain after August 15 is to be taken up at Washington on August 7. Talk continues to be heard of a 27c. price after August 15. It is asserted confidently in some quarters that a 30c. price will be in effect before or by the end of the year.

TIN

The market continues devoid of transactions and is extremely dull. The only business reported is occasional sales of small lots of Banca or Chinese tin in transit. The supplies of British tin are dwindling, and prices in London are advancing. The license situation over there is tightening, and no Straits or Lamb and Flag tin is being offered. Two licenses are now necessary to do business there, one to ship the tin and one to sell, the latter license being necessary first. The granting of either at present seems difficult or impossible to get, according to present advices on this side. Buyeres here are not pressing their needs, for they know it to be of little avail. They merely wait for such offerings as present themselves. The quotation for spot-tin is a little higher at 94c., New York, but is entirely nominal. It is at least interesting to record the strange fact that, whereas before the 25% increase in freights was allowed, the rate from Pacific ports to Eastern points on tin was 56.2c. per 100 lb., now it is $1.25 per 100 lb., or an increase of over 100%. The question of duty has again come to the front. There is talk in Washington of the placing of an ad valorem duty of 10 to 20% on all imports now free. This would include tin, but the buyer or consumer would have to pay it. Arrivals continue fairly good. Those at Atlantic ports thus far in July have been 625 tons, with those at Pacific ports 1925 tons. Again, there is not the usual estimated quantity afloat reported. As indicated above, London prices are higher. Yesterday spot Straits was quoted at £365 10s. per ton as against £340 a week ago.

LEAD

Conditions are essentially the same as for some little time past. Most producers are sold up for July, and most or all of August, and the metal is extremely scarce. The quotation is still held in bounds by agreement at 7.75c., St. Louis, or 8.05c. per lb., New York, and efforts to so maintain it are concerted and vigorous. The scarcity is due almost wholly to Government requirements. The demand in general is large and urgent. If producers had more to sell it would indeed be difficult to quote on any delivery, except New York or St. Louis, because of the freight-rate tangle. The increase in the rate to New York of over 75% has unsettled matters. It is believed that quotations to other points than New York will be on the St. Louis basis, plus the freight rate, whatever it is. A meeting in Washington lately to discuss the rate question is understood to have resulted in no clearing up of the situation. Japan is in the market again.

ZINC

The market is slightly easier but nominal at 8.50c., St. Louis, or 8.75c., New York, for early or third-quarter delivery. The premium for fourth-quarter has disappeared and no one is asking more than 8.50c., St. Louis, for that position. For early delivery as high as 8.60c., St. Louis, has been realized this week for small lots, while there are some willing to shade slightly 8.50c., St. Louis. Demand, however, is light and offerings are not large. Some producers are pretty well sold up, while other large ones are not eager to sell. There are some small ones who are anxious to do some business. The lag in the recent upward movement is regarded as welcome, and some regard the market as firm at present levels for some time. The situation in general is more satisfactory and healthy than in some time, and a fair profit is regarded as possible now for most producers at present price levels. Grade A zinc has a maximum Government price of 12c. per pound, but it has been sold under this.

Sheet zinc is fixed at 15c., with plate zinc at 14c. per pound.

ALUMINUM

Government prices continue to rule for scrap and No. 1 virgin metal, 98 to 99% pure, at 33c. per pound in lots of 50 tons and over, 33.10c. in lots of 15 to 50 tons, and 33.20c. in 1 to 15-ton lots.

INFORMATION FURNISHED BY MANUFACTURERS

THE TANKS

By Col. E. D. Swinton

*Ever since the appearance of the magazine rifle the advantage that would be conferred on the attack by employing a moving armored shield, fort, or cupola, has been so obvious that a vague consciousness of it has probably at some time or other formed the subject of the day-dreams even of those not directly concerned with war, but happening to possess some knowledge of military history and mechanics and to be blessed with imagination. Since the introduction of the machine-gun, and the more recent appearance of the armored motor-car of the ordinary wheeled type, the idea of constructing some such engine has occurred to the minds of many more, especially to engineers.†

But, as the Bible has it, "Better is the sight of the eyes than the wandering of the desire," or, in other words, it is one thing to dream and another to convert a dream into actuality. It would, no doubt, be of interest to make some reference to the personal element and the share of responsibility attributable to individuals for the realization of what has long been a subject of aspiration. This, however, is neither the time nor the place to do it. The subject has already been rendered controversial by the contradictory statements and the various claims for the credit of the invention that have appeared in the press. The truth is that several people have been concerned to a greater or lesser degree at different stages, though the merit of inventing some of the crucial mechanical details can be ascribed definitely to individuals. Nevertheless, one assertion has been publicly made by a writer of eminence and weight, which must be refuted. H. G. Wells, who prophesied to the world the arrival of such a monster as the tank so long as 13 years before it appeared, and who, in his 'War and the Future,' published in 1917, gives an excellent description of the existing machine, and a most illuminating imaginative forecast of its future evolution, both implies and states specifically that the tanks have not come from military sources, but have been thrust upon the soldiers from without. This is a sweeping indictment, reiterated complacently and with apparent satisfaction, but incorrect and presumably based on ignorance of the facts. It is true that certain people who are not soldiers have played a large and valuable part in creating the tank. It is also true that others who are soldiers have not done so, but the first to appreciate the necessity for it, to urge its provision, and to insist on the feasibility of its construction, were, in fact, soldiers. This point is emphasized, not because it is either remarkable or praiseworthy on the part of any men that they should be the first to realize the need for an obvious development connected with their own profession, but in justice to those who can neither make speeches nor write to the press to defend themselves against mis-statements, even when publicly made. Moreover, those soldiers who gave the impulse for this innovation did so without knowledge of Mr. Wells' brilliant forecast.

The first definite proposal for a fighting machine on the lines of the existing tank was due to the appearance of the Hornsby-Ackroyd caterpillar tractor, which was tested for military traction purposes in England in 1906-1908. It was made by a military officer, and was carried to the stage of preparing sketch drawings, when the project died for want of support. Like Mr. Wells, he was ahead of his time. Independently, without knowledge on their part of the previous abortive effort, a similar idea took shape in the minds of other soldiers at the very beginning of the War; and it will specially interest the American reader to learn that it was on this occasion inspired by an invention from the country in which new ideas are supposed always to be welcome. In July 1914 it became known that there was in existence an automobile for agricultural purposes, propelled on the caterpillar principle, which possessed unusual powers of crossing rough ground and of traversing obstacles. This was the Holt tractor, made in Peoria, Illinois. The accounts of the performances of this machine, constructed for haulage and not specially for climbing, suggested that one similarly designed especially to travel across country would, except in speed, have all the value of the existing armored motor-cars without their limitations. The immediate incentive to action on the part of those responsible for the tank, therefore, was the fact that the construction of such a machine at last seemed to be practical. Even its most ardent backers, however, did not then fully realize how great the need for it was. The War had not lasted long, however, before this was made clear.

With their proverbial thoroughness, the Germans had not only studied the Russo-Japanese war, but had turned their studies to good account. One of the outstanding lessons of that struggle was the great value of machine-guns on the defensive, especially exemplified in the battle of San-de-Pu and at Port Arthur, and, in preparation for the conflict that they had good reason to know was coming, the Germans had, either in accordance with the deductions made, or as a result of their own experiments, secretly provided themselves with thousands of these weapons, and trained a large body of picked troops to man them. It is stated that the total number in their possession in August 1914 amounted to upward of 50,000. The worth of these guns was soon proved, firstly, in the attack and then in the defensive, both in delaying rear-guard actions conducted by detachments, and in protracted resistance carried out by large forces. Every offensive undertaken by the Allies on the Aisne, and afterward, bore witness, in the toll of balked assaults and infantry losses, to the stopping power of these weapons, and justified the astuteness of the enemy general staff. Each attack also showed their comparative invulnerability, even in hastily-constructed defences, to the artillery which was available against them. Indeed, it may be said that the murderous power of the machine-gun, when used lavishly

*Abstract: Booklet published by George H. Doran Company, New York.

†M. Albert Robida, both in his writings and pictures in 'La Caricature,' predicted the use of tanks in 1883; see 'Strand Magazine,' June 1917.

and with skill—and the Germans are artists in handling it—came as a revelation to their enemies.

As time went on, with the operations assuming the character of siege warfare, the Germans had time to erect miles of barbed wire and other obstacles, and the effectiveness of their machine-guns was greatly increased. In proportion, also, as the defences, including the dug-outs and shelters for these guns, were elaborated, did the immunity of the

COLONEL SWINTON AT STOCKTON

latter from artillery fire keep pace with the gradually increasing weight and number of the Allied guns. This progressive improvement of the defences continued until the machine-guns were ensconced in caverns and galleries 30 ft. below ground-level during bombardment, and brought up only at the last moment for a point-blank battue of the attacking infantry. But long before the latter stage was reached it had been brought home to the protagonists of the tank that they were right. It became increasingly obvious that to launch assaults against the defence as organized by the Enemy, unless the positions were first blown to dust, was merely to throw the infantry into a maze of barbed wire in which they would be caught helpless as flies on 'tanglefoot' and mown down by rifle or machine-gun fire at short range poured in from different directions; or, if they were successful in getting over the wire into a trench, to subject them to enfilade fire from the same weapons placed for that object. It was established that, at all events until the British artillery increased in strength to a degree that would enable it effectively to cut the entanglements on the front of assault and blast the defences into shapeless mounds, it was essential to employ some moving bullet-proof device, which could not only climb forward and forge its way through uncut wire, but could knock out machine-guns in a straight fight. The offensive side of the projected machine then assumed greater importance; and it was realized that the tank should primarily be a machine-gun destroyer. If it be asked, therefore, what single factor was most instrumental in forcing the tank into being, it can be said that it was the logical exploitation by the Germans of the machine-gun, usually the Maxim, probably the most efficient weapon of wholesale destruction ever created.

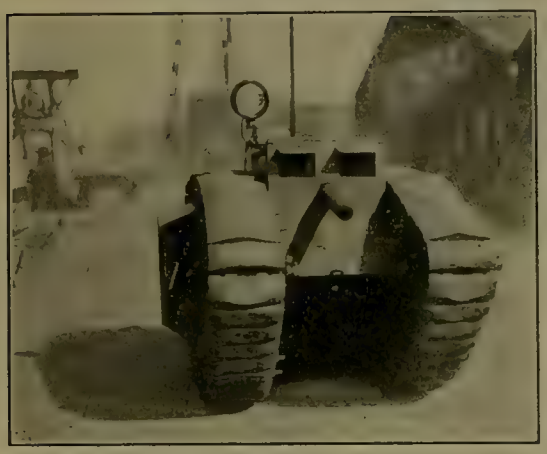
There is an English proverb that commends as a cure 'A hair of the dog that bit you.' It is an interesting fact, though hardly a coincidence, if national inventive characteristics be borne in mind, that one of the most deadly man-killing machines, which the world owes to the genius of one American, the late Sir Hiram Maxim, should have found its antidote in a device directly inspired by the invention of a compatriot, Benjamin Holt.

A word of general description and a few more upon the functions of the tanks. They are powerfully-engined armed automobiles, enclosed in a bullet-proof casing for the protection of their crews. Propelled on the caterpillar principle, they possess considerable powers of traveling over rough ground, both in crossing trenches, craters, and other cavities, and of climbing over raised obstacles, such as parapets. They can tear their way without difficulty through wire entanglements, can uproot fairly large trees, and can throw down the walls of ordinary dwelling-houses. Nevertheless, in spite of their elemental strength and apparent clumsiness, in the hands of skilled drivers they are as docile as trained elephants under their own mahouts.

They are divided into 'males' and 'females'. The male is par excellence the machine-gun hunter and destroyer. He carries light quick-firing guns capable of firing shell, and is intended to be to the machine-gun what the torpedo-boat destroyer was designed to be to the torpedo boat, or the ladybird is supposed to be to the aphis. The 'female', which, in accordance with the laws of Nature, is the man-killer, carries nothing but machine-guns for employment against the enemy personnel. Her special rôle is to keep down hostile rifle-fire, to beat back counter-attacks and rushes of infantry, and to act generally as a consort to her lord and master. Both, however, are heavy weights endowed with great brute force, and share, in common, the attribute of being able to roll out and flatten machine-guns and their emplacements. Both, therefore, act as protectors to infantry, in so far as they can destroy or 'blanket' the one thing which has proved its greatest bugbear in the attack. Moreover, every tank that goes forward, whether actually moving or disabled, assists the infantry near it in another way. It bulks above them and is the centre of

EMPLOYEES OF HOLT MANUFACTURING CO. LISTENING TO ADDRESS BY COLONEL SWINTON

attraction. It acts as a magnet for the bullets of the hostile machine-guns, and collects them to itself as Arnold von Winkelried is supposed, in 1386, to have drawn to his own body the spears of the Austrians at the battle of Sempach. Every bullet that clangs against its steel sides is one less aimed at the infantry. Each silvery star splashed on its hide is the signature of one that has not drilled its way



'FEMALE' TANK CARRYING MACHINE-GUN

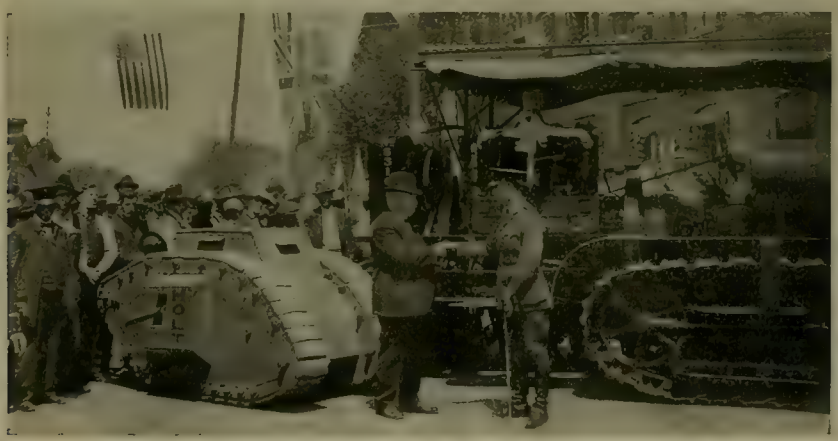
through the body of an infantry soldier. To be the nurse, protector, and backer of the attacking infantry, who, in the vernacular, 'always get it in the neck,' was the motive underlying the action of the new arm. As it was expressed in the exhortation given to the officers and men going forth to take their machines into battle for the first time, whatever mistakes might be made, whatever mischances might befall, if the tanks gave reason for their comrades on foot to thank God for their presence, they would have justified their existence.

It has been justified.

It is true that in any consideration of their employment too much importance must not be attached to some of the results of their first appearance, for certain influences then came into play which can never again have quite the same effect. Against the Germans they had all the advantages of being a surprise, and, by their strangeness, and the apparently irresistible nature of their advance, inspired terror. On our own infantry, on the other hand, their almost equally unexpected début, and their abnormality, had quite the contrary effect. It was a relaxation of tension, and a reaction which had its own particular value. The very grotesqueness of the machines, their ungainly indescribable method of progress, their coloring—surpassing in weirdness the sickliest fancies of the most rabid Cubist—were in reality great moral assets. They supplied the touch of comic relief, and excited the mirth of the British soldiers, always blessed with a keen sense of the ridiculous. They acted as an antidote to the effect of the Jack Johnsons, Weary Willies, Silent Susies, Whizz Bangs, Sausages, Rum Jars, Tear Shells, Gas Shells, and all the other frightfulness of the unspeakable Boche. They counteracted the weariness, the hunger and thirst, the dust, the mud, and all the squalor and filthy discomfort of war. As has been related in the accounts published at the time, it was a laughing cheering crowd of infantry that in many cases followed the tanks forward on September 15. On the other hand, the new engines underwent their baptism of fire, and there were failures due to this, which should not recur. Some of these results were produced by the factor of novelty, and are already discounted, but the solid material value of the tanks to the infantry remains.

Frederick Palmer, the American war correspondent with the British army, has estimated that in the latter stages of the battle of the Somme the intervention of the tanks, though many machines failed from mechanical and other defects, saved some 20,000 British lives, and subsequent estimates of the quality of the assistance rendered by them during May 1917 are similar. The most convincing proof of the difference made by their intervention is ocular, and is afforded by the 'pattern' of the field of battle over which a British attack has passed. Where tanks have accompanied the advance and have been able to eat up the enemy machine-guns left over by our bombardment, the bodies of our infantry strew No Man's Land irregularly, here and there. Where tanks have not been used, in some places the bodies can be seen to be lying in front of the enemy's machine-gun 'nests' and strong points, in swathes like cut corn; in a series of high-water marks showing where the successive waves of the assault have met and been petrified by the death-dealing spray of the German Maxims.

Not only have the tanks saved life by the moral effect of their approach and the number of machine-guns put out of action, but they have themselves taken an active part in killing; on some occasions, indeed, having played the leading rôle in what might be called a 'butcher's dream.' That



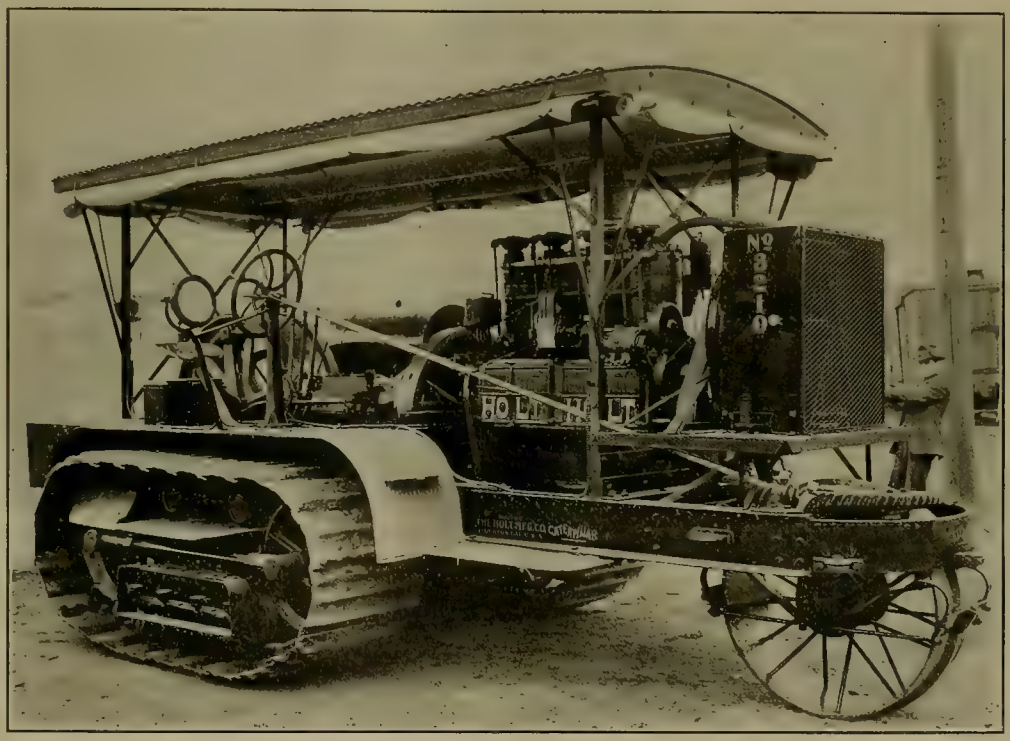
COLONEL E. D. SWINTON GREETING BENJAMIN HOLT AT STOCKTON, CALIFORNIA

the Germans appreciate the significance of the new development is clear from the instructions issued, and the elaborate protective measures taken. In spite of the ridicule usually poured on the new weapon by their newspapers articles do occasionally appear that sound another note. For instance, Lieutenant-General Baron von Ardenne stated in the 'Berliner Tageblatt' "These powerful armored cars, which were first used by the British, are undoubtedly the most wonderful weapons that modern tactics have revealed in warfare * * *"

This, the latest engine of war, has, of course, its limitations. For instance, tanks alone, in their present state of development, cannot push to a decision nor win a great action. That must still be done, as in the past, by the infantry, but Behemoth, clad in his bullet-proof skin, and

Colonel Swinton, now advanced to the rank of General, recently came to Stockton, California, to greet Benjamin Holt, and congratulate him upon the service that his labors in developing the Caterpillar tractor had rendered to the cause of the Allies. Addressing a mass meeting including the whole force of the **Holt Manufacturing Co.**, in that city, he said in part:

"I am indeed pleased to come here. Firstly, this is California and it is the first time I have visited it. Since I have been in this country I have heard the expression 'God's Country' pretty often. Sometimes I have spoken up and I have said, 'There is another 'God's Country' somewhere else,' but I haven't said very much. This is the third day I have been here and I think this must be God's special corner of the country. Of all places that I have wanted to visit,



A TYPE OF THE HOLT CATERPILLAR TRACTOR

urged onward by enormous horse-power, laughs at entaglements, and machine-guns are his 'meat.' His main object cannot be too often or too strongly emphasized; other ancillary duties need not be specified here. To the infantry soldier attempting to force his way by his own puny strength through mud or dust and groves of barbed wire, his body naked to every kind of missile, but more especially to the sleet of lead which whistles horizontally across No Man's Land, he is the mechanical big brother armed with the punch and the big stick. This little book may perhaps be read by some of the 'boys' from Massachusetts, Oregon, Texas, Pennsylvania, or other States of the Union, who, as members of the infantry of the United States Army, may find themselves in the not distant future scrambling across No Man's Land alongside their comrades of the Allied forces, who have already 'been over.' For them it may perhaps be permitted without presumption to add a word of counsel from one who, though not an infantry soldier, knows something about it. To the time-worn advice of: "Johnnie, get your gun," he would merely add: "And bring your tanks."

this is among the foremost because it is the original birthplace of the Holt tractor. The reason I take special interest in that is that I happen to be an engineer myself, and, as you know, had a good deal to do in the invention of a machine that has saved thousands of lives, a machine, don't forget it, that has taken thousands of lives, too, thank God! In July 1914 a friend of mine, a mining engineer, was looking for a cheap system of transportation. This was before the War. He usually tells me of his difficulties and gives me his ideas that might help me, and he wrote me and he said, 'I struck a Yankee machine in Antwerp that they call a Holt 'Caterpillar' tractor.' He said, 'This machine climbs like hell.' I had known of the soldiers wanting just such a machine ever since the time of Julius Caesar. I thought if this tractor climbs like hell, what was wanted was something that would climb to beat hell. Julius Caesar would like to have had it for his infantry.

"At the beginning of the War I had a peculiar position. I had a knowledge of the needs and incidentally I had the chance of seeing a lot of things, and I discovered a lot of things that had not been discovered before. The Germans

had secretly armed themselves with thousands of machine-guns. The machine-gun is the most perfect man-killing gun that has ever been made. The Germans manufactured it in England under a British royalty. For a time before the War broke out, they did not pay any royalties and did not submit any accounts. They knew the War was coming. They started the War with about 50,000 of these guns ready. Our men went out against these machine-guns and they were killed in thousands. The machine-guns were at them on every side. They are a fine machine and the enemy used them well and they mowed our men down by thousands and it appeared that the idea I had in July 1914, if employed, might produce a machine that would climb to beat hell, which was absolutely right. We must have something that would go across trenches and over barbed wire. To cut a long story short, there were men being killed by the thousands by these machine-guns. It was really a disease against humanity that was invented by the late Hiram Maxim, so you Americans have the credit of producing that disease, but you have the credit of producing the antidote, too. The antidote was the Holt 'Caterpillar' tractor produced by Benjamin Holt.

"Tractors have taken guns by the thousand. You men here who have toiled and sweated and have given your time and are working with your brains and your hands have given us splendid help, and the men 'Over There' appreciate your work and, men, don't you forget it! It is something to know when you are working away here and the work is tiresome and the day is hot, it is something to realize that the men on the other side do feel grateful toward the people who are making these things. And your machine is one of them that is doing work most worthy of gratitude.

"We started out to make that climbing machine, the tank, that machine to climb to beat hell, and it was the machine-gun destroyer, and it crossed every trench. They made these tanks, a large number of them, between August 1916 and March 1917 and we kept it a secret. It had been whispered around that they were reservoirs to take water to our troops in Egypt. Reservoirs was a good word, but it was a long word, and tank was a better word. This is camouflage. When we began to cut holes in the sides, the word went around that these machines were built as revolving snow plows for Russia. Upon every tank in the shops we had painted a sign, 'With Care to Petrograd.' It was a surprise to the Germans when they went out with their machine-guns to pour forth their ammunition and not see men falling down like cattle. You would be surprised too. The tanks were also used in large numbers at Cambrai last year. They have taken thousands of German prisoners, they cost us but a small amount of money, there were no horrors, and we lost practically no lives. I think this machine represents the beginning of a new development.

"Just one word more.

"I wish to give you a message from the other side, from my own people and from my own soldiers. I am not empowered to speak for the French, but, God bless them, they have put up a wonderful fight. And I am not empowered to bring you word from Italy, but I know they are all grateful to you. We are going to stick with it until hell freezes. I am going to take the message from you that you are standing back of the men and are going to keep them well equipped. You are in this war to win and it's a very big undertaking. I look upon Germany as a disease, and we have got to fight it and down it, and it has done me good in my tour through the States to think how everybody has responded from beginning to end."

HOLT CATERPILLAR TRACTOR DRAWING TRAIN OF TRUCKS IN THE DESERT

The Engineering Index Annual for 1917 lists and describes practically every article or engineering society report published in the United States or abroad during the year. The Index comprises about 250 publications representing 17 nations and colonies and six languages. About three-fourths of these journals are printed in English, the others being in French, Spanish, German, Italian, and Dutch. The Engineering Index makes readily available all the huge mass of material published by the engineering press of the world so that one can find without difficulty every article published. It can be obtained through the 'Mining and Scientific Press' for $3.

A. Niedermeyer, for many years connected with the Worthington Pump & Machinery Corporation, more recently as works manager of the Snow-Holly plant of that corporation, at Buffalo, New York, resigned on May 31 to devote his entire time to private enterprise.

The Dorr Company announces a change, effective August 1, in the address of its New York office to 101 Park avenue, where much needed additional space has been secured to care for the continued expansion of its business.

Edward J. Albert, for five years manager of the mining and power department of the Canadian Allis-Chalmers, Ltd., has become sales manager for the Thwing Instrument Co. at Philadelphia.

NOTES 141

THE TESTING OF MEN AND ORES 142
The training of technical men; the race is not to the swift but to the persistent; character and circumstance the determining factors; the way to success illustrated in the career of John M. Callow; fortunate early friendships; his influence on successful concentration practice in America; practical training gave Mr. Callow opportunity to develop engineering ability; personal characteristics. M. & S. P., August 3, 1918.

THE FINANCIAL SAFETY-VALVE 143
American products exported to our Allies; the trade-balance adjusted by credits granted by the United States; Liberty Loans represent a national asset in large part; business of the world on a credit basis; gold held by the Treasury, and not by individuals; this should prevent gold going to a premium; a change in the official value of gold would reduce the purchasing power of the credits extended abroad; these obligations a financial safety-valve. M. & S. P., August 3, 1918.

DISCUSSION

DEMOCRATIC CONTROL OF INDUSTRY
By P. B. McDonald 145
British Labor Party's program for a socialized state after the War; the 'elective absolutism' and its equalizing mediocrity; need of developing men of ability and initiative; Adam Smith proved the advantage of individual selfishness. M. & S. P., August 3, 1918.

WHAT IS A DOLLAR?
By W. de L. Benedict 145
The unit of value 25.8 gr. standard gold 900 fine; all other dollars a substitute for this; the British standard of value; weight, fineness, and value of the silver dollar; effect of using other metals as monetary standards; the price of an ounce of gold is an ounce of gold; disastrous effect of altering the standard. M. & S. P., August 3, 1918.

THE RELATION OF GOLD TO WAR FINANCE
By B. L. Thane 147
Gold comes mainly from low-grade deposits; decline in gold production; question of importance of gold mining; standard value of gold arbitrarily fixed; gold formerly varied in price; ratio of gold to credit-money; increased cost of gold production; what would happen if the Allies should fix gold at $40 per ounce; similar suggestion made in England. M. & S. P., August 3, 1918.

ARTICLES

CORRECTION OF STADIA-READINGS TO HORIZONTAL
By E. A. Byler 150
Table of corrections to be subtracted from rod-readings for each 100 ft. from 100 to 1000. M. & S. P., August 3, 1918.

JOHN M. CALLOW—ENGINEER AND METALLURGIST
An Interview, By T. A. Rickard 151
Early life in England; apprenticed to a firm of engineers in Norwich; journey to Australia; first contact with gold mining; return to engineering study in England; visit to America; became a farmer in Colorado; began engineering practice with Stearns-Roger Mfg. Co.; mill construction in the San Juan district; wider field as designer of plants in Utah with Samuel Newhouse; invented the Callow cone and screen; experiments in pneumatic flotation at Mullan, Idaho, and Miami, Arizona; the Callow cell; future of flotation. M. & S. P., August 3, 1918.

THE IMPORTANCE OF GOLD PRODUCTION
By Sir Lionel Phillips 158
Rise in prices of commodities and labor; specious argument on gold standard; British committee on currency; value of gold in the world's markets; adjustment needed between value of gold and other commodities; necessary to increase output of gold; a bounty or other compensation requisite. M. & S. P., August 3, 1918.

ENGINEER OFFICERS' TRAINING-SCHOOL AT CAMP HUMPHREYS 160
M. & S. P., August 3, 1918.

OXY-ACETYLENE WELDING OF A ROLL-FRAME
By O. J. Zook 161
M. & S. P., August 3, 1918.

CONCENTRATING A TIN-WOLFRAM-LEAD ORE ... 162
M. & S. P., August 3, 1918.

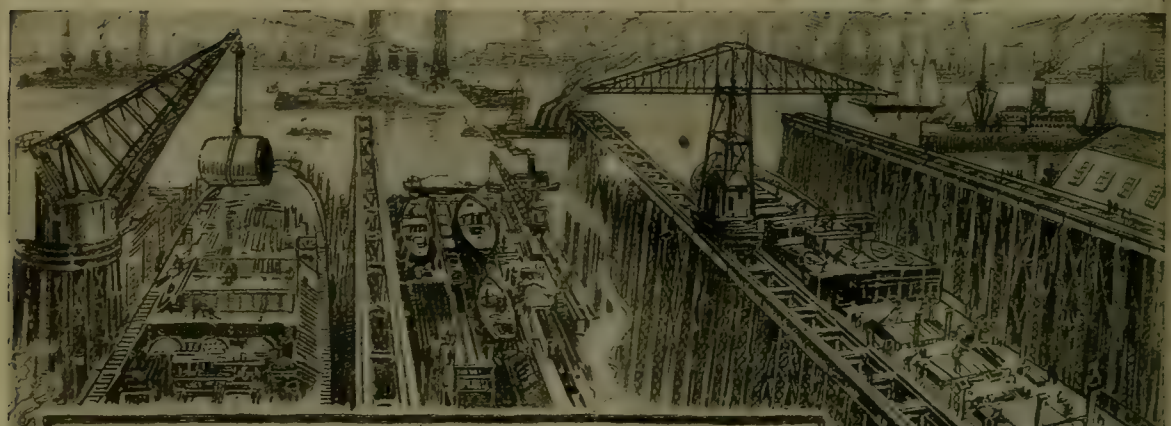
Branch Offices—Chicago, 600 Fisher Bdg.; New York, 3514 Woolworth Bdg.; London, 724 Salisbury House, E.C.
Price, 15 cents per copy. Annual subscription, payable in advance; United States and Mexico, $4; Canada, $5; other countries in postal union, 25s. or $6.



Simplified Arc Welding Equipment Now Ready to Demonstrate

Before ordering your welding equipment investigate the General Electric Company's novel welding system. Some of its points of superiority are:—

1. Constant Energy.
2. Shortest known arc.
3. High efficiency.
4. No resistance in series with arc.

By the use of this equipment good operators are producing consistently perfect welds.

We are prepared to demonstrate this equipment and make good deliveries.

GENERAL ELECTRIC COMPANY

EDITORIAL

EVERY intelligent democrat and patriotic citizen must have been glad to read the President's warning against mob violence, whether aimed against pro-Germans, I. W. Ws., or negro criminals. All lynchings and other acts of violence are "a blow at the heart of order, law, and humane justice."

THE Railroad Administration has authorized the sale, after August 1, of mileage scrip, good on all the roads in the country under control of the Government, at the basic rate of three cents per mile. The coupons will be accepted for transportation, sleeping-berths, and dining-car charges, but the war-tax must be paid to conductors on the presentation of the mileage-book.

IN consequence of prohibiting the importation of graphite a sufficient supply for domestic needs has been developed in this country. The War Trade Board accordingly has extended the restriction to graphite crucibles, effective from July 15, this order applying to all outstanding licenses for the introduction of these wares. The restriction on graphite, originally limited to July 1, has been extended to the end of the year.

WHY baseball-players should be held in such tender regard at this time we fail to understand. The spectacle of the Secretary of War holding a conference with base-ball 'magnates' over the question of drafting professional athletes engaged in the most commercial of all sports is ludicrous. No sport is more prostituted to money, even the teams being 'owned' by sundry rich men and exploited for profit. Moreover, base-ball is essentially a spectacular game, involving the time of people that do not take outdoor exercise themselves but pay to watch others. Why should a husky base-ball player be excused from military service when others far more useful are drafted?

APPARENTLY the Senate of the United States has time for amusement, if one is to judge from the length of the speech delivered by Senator Sherman when attacking Mr. George Creel. The speech is an amazing example of vituperation, and it would be funny if we were not in the midst of a great war. Sample copies of Mr. Creel's 'Official Bulletin' have reached us; it appears to be a waste of good paper; indeed, several branches of the Government set a bad example in their squandering of paper and postal facilities, although this has not hindered the War Industries Board from scolding sundry periodicals for doing the same thing. Why does it not make an effort to stop the wastage involved in the Sunday supplements of the yellow press, which, as Senator Sherman says, "in peace is a pestilence, in war a skulking menace."

PERU is making known her resources in an intelligent manner through the medium of bulletins conveying technical information in popular form. This is done through the Cuerpo de Ingenieros de Minas, ostensibly and in reality a society of technical men, but under the supervision of the Ministry of Fomento, or industrial administration. This method of linking the men of professional training directly with the Government is not peculiar to Peru. We mention the practice in that country merely because we chance to have before us the latest publication of the 'Corps of Mining Engineers', this being an excellent account of the iron deposits of Huacravilca by Señor E. I. Dueñas. The same system prevails in Chile, in the Argentine, and in Spain. It is a commendable idea; the technologic branches of the government are thus kept in vital communication with the workers in the field, while at the same time the technologists are kept mobilized for co-operative national effort, sharing the responsibility of administering the scientific bureaus. The superb service of our own Geological Survey, and of the Bureau of Mines, which was, so to speak, fashioned out of one of its ribs, leaves no room for criticism; the thought is suggested, however, that a closer organic relationship of the engineers throughout the country with such institutions might afford possibilities of inspiration both within and without the bureaus.

IT is reported that Senators Henderson, Walsh, and Jones called at the White House the other day to present reasons to President Wilson for opposing the passage of the War Minerals Bill. When it is remarked that these gentlemen represent respectively the States of Nevada, Montana, and New Mexico, we may shrewdly guess the cause of their anxiety. The copper producers,

at least some of them, appear to believe that this particular war-emergency legislation is capable of being interpreted to include the major non-ferrous metal industries. If they honestly hold that opinion the proper thing would be to ask their friends in Congress so to amend the Bill as to restrict its application beyond all doubt to the metals and minerals specifically mentioned. No one will object to that, for we want to ensure a sufficient output of manganese, tungsten, chrome, sulphur, pyrite, and other essentials to sustain our war industries in the most efficient manner. Mere opposition to the passage of the Bill, the defects in which might be cured so readily with full consent of its sponsors, is difficult to explain. Either the Government must become the producer, or the individual producers must have adequate guarantees to cover the capital expenditures necessary for mining these substances, if the War Industries Board is to escape a serious shortage. The pending Bill is the fruit of serious consideration by those most competent to determine what branches of the mineral industry required subventioning. To block these efforts is playing into the hands of the Enemy.

THE British government has arranged with the United States Treasury Department for rupee credits in New York at the rate of 35.73 cents per rupee for telegraphic transfer. This places American merchants on exactly the same basis as commercial houses in England with respect to rupee exchange. Nearly the whole of the silver coin so far melted under the Pittman Act has been exported to India in liquidation of a trade-balance between that country and the Western nations. The melting of the coin is limited to the corresponding silver certificates offered for redemption. The quantity turned in had amounted to $64,000,000 on July 10. This is smaller than had been anticipated, but it has served the double purpose of relieving an acute financial strain in India, and of protecting the American silver producer by an assured market at $1 per ounce. The total silver output of the United States in 1917 was 72,244,500 fine ounces, so that the silver the Secretary of the Treasury is required to buy in order to replace the coin melted under the Pittman Act is already in excess of the half-year's production. The new Federal Reserve notes, in $1 and $2 denominations, that are to be exchanged for silver certificates of like amount, are not yet ready for issue; the exchange has been effected in bills of $5 in value or higher. The returns, however, have been slow, and special efforts may be necessary to induce the people to deposit the certificates in the banks. The Treasury still holds 426,000,000 silver dollars, against which $381,806,776 in silver certificates remains outstanding.

SOME years ago an attempt was made to prepare a Blue Book of Mining Engineers, a sort of Burke's Peerage or Debrett's Baronetage of the profession. The scheme fell flat; it was killed by ridicule, as it deserved. Now we hear from our brethren in the East, where wisdom flourishes, that an Academy of Engineers is to be organized, a sort of House of Lords of the profession. The idea has been presented officially to Mr. W. C. Redfield, the Secretary of Commerce, and on his initiative a bill was passed by the Senate in July 1917 to create an American Academy of Engineers, to be organized by ten engineers, who, in turn, are to name forty more. To these fifty select persons is to be given the power of adding 50 or 100 more, whereupon the organization becomes a closed circuit, no further additions being permissible except on the death or resignation of the elect, when the survivors are empowered to fill their ranks. The bill passed the Senate unopposed, because the attention of the profession had not been attracted to it by any publicity. Since then various engineering societies have heard about it, most of them taking steps to denounce the establishment of such a body and instructing their officers to communicate their opposition to members of the House, where the bill now rests. We are glad to learn that the Engineering Council, when asked to help in securing the passage of the charter through Congress, referred the matter to a committee, which has decided almost unanimously to oppose the scheme. Four out of five of that committee are on the list of the proposed Academy. As the Engineering Council represents four engineering societies numbering 30,000 members, it is to be hoped that this action by its committee will prove sufficient to block the attempt to imitate the outworn snobbishness of Europe.

The Testing of Men and Ores

If anything were needed to prove that it is character that makes a man, not education, the proof could be found in the diversities of origin and of training from and through which distinguished members of our profession have come on their way to a successful career. Some of them have stepped from scientific colleges or universities as fully equipped as academic study could make them; others have had not even a full course in common schools, and have been compelled to earn their living while their competitors were still undergoing a technical training. The race is not to the swift, but to the persistent; it is not to the smart, but to the wise. Character and circumstance appear to be the two determining factors. The strong character steers amid the shoals of circumstance to the open sea of opportunity; the weak character drifts upon the bank and is wrecked by the first unfavorable wind of adversity. Fortune favors the brave; good luck betides the persistent. Such are the ideas suggested by the interviews with distinguished engineers that we have published and by the one that we publish this week. The subject of our latest interview is widely known for the mechanical devices bearing his name and invented by him; he is also one of those fortunate men who have friends scattered all over that generous kingdom we call the mining world. John M. Callow was born a farmer's son, but the farm was within sound of the North Sea, and to him as to other young Britons from time immemorial the call of the sea was the réveillé

of adventure. He had no wish to stay at home on the farm, he wanted to become an engineer, and as an engineer to make a career for himself in a wider world outside the little village in which he was born. While yet a boy he sailed for Australia and visited the old gold-mining districts in Victoria and afterward the newer mines of Queensland, where he had his first experience as a mill-man. It was a mere taste of engineering, but the voyage was an education to mind and body. He returned home and completed his training with the local firm of engineers to whom he was apprenticed; but he could not stay in Norfolk; always there was the voice of the sea and the call of the wide spaces. He went to Colorado. Not yet physically strong enough to follow his bent, he applied the art of engineering to the improving of land, and prospered, both in pocket and in health. He left the farm for the draughting-room and soon thereafter demonstrated his intelligence in the selection of a wife. Early in his career he became associated with resourceful men, whose stimulating goodwill he was quick to win. A little mining and milling in the mountains of the San Juan added several more pages of useful experience; and then came the larger opportunities for designing mills offered by that energetic mine-promoter, Mr. Samuel Newhouse, and that experienced mine-manager, Mr. Thomas Weir. For these gentlemen Mr. Callow made milling-tests, suggested flow-sheets, and designed plants. Becoming "tired of panning," he built a miniature Wilfley table for making his tests on the Highland Boy ore. That little concentrating-table proved so useful that he made copies of it, and sold them, sending them all over the world. On the ground-floor of his ore-testing establishment the original is still to be seen, together with the accessories, from which he developed the idea of a central plant for testing ores as a preliminary to building mills. This plant is now well known, and it is noteworthy that, as he went home to find a wife, so also he chose two school-boy friends to be his partners in business. He designed the cone, the screen, and the tank that bear his name, proving his restless ingenuity, and in later days he introduced the froth-making machine that has made him famous, for wherever flotation is practised there the Callow pneumatic cell is known. It is to be regretted that the exigencies of litigation—not his own legal quarrels, but those of others—prevent him from talking freely on flotation, a branch of metallurgy to which he has made sundry notable contributions. However, the interviewer was able to elicit a few observations, all of which will be found interesting. The way in which he developed his ability as a draughtsman to the designing of new machines is a tribute to his engineering apprenticeship and also to his concentration of mind. He could concentrate thought in his head as he could concentrate chalcocite on his little Wilfley table. As a school-boy he took little part in sports, probably from lack of physical exuberance; instead, he invested his pocket-money in a lathe, to which he devoted the time his fellows gave to cricket. Besides originality, he has the saving grace of being willing to listen to constructive criticism. Impulsive by temperament, he can make enemies, but not nearly so fast as he makes friends, and he holds them, for loyalty is one of his traits, also kindliness. Many are the young men to whom John Callow has given a helping hand, in the way of advice or something more substantial. So say those that know him best. That is worth more than a gold medal.

The Financial Safety-Valve

In 1917 the United States exported about 790,000,000 pounds of refined copper, to which must be added 15% more for copper in other merchantable forms. We sent abroad 370,000,000 pounds of brass as bars, plates, sheets, and scrap, and $280,000,000 worth of brass manufactures. These items do not include the copper and brass constituting parts of machinery and other goods shipped to Europe. In 1917 our cotton crop amounted to 12,300,000 bales and we exported over half of it. England took approximately 3,500,000 bales, France 600,000, and China nearly the same quantity. In addition to that we sent overseas nearly $150,000,000 worth of cotton goods. These examples of the movement of trade serve to remind us that our Government, in spite of its extraordinary military requirements, is not by any means absorbing all the commodities we produce. Also it must be noted that the Liberty Loans represent in large part a national asset; over two-thirds of the amount of these bonds to date is covered by advances to our Allies. In one aspect of it the people have been subscribing heavily to foreign loans, guaranteed by our Government. Broadly considered, these are World Liberty Bonds, and back of them stands the credit of the United States, and England, and France, of Italy, Belgium, Serbia, and Greece. The total issues are approximately $8,000,000,000 and the amount loaned abroad is $6,380,040,000. This investment is destined to give us great financial strength in the days after the War. The balance of trade in our favor last year was $3,273,789,699, and part of that was absorbed in transactions outside the settlements made through warrants for account of our Allies issued against the U. S. Treasury. It was represented by purchases of bills of exchange on London through the American agents of the Bank of England. When we ask where our supplies are going, the answer is not merely that they are going into the great sink of war but that a large part of them is entering into the structure of credits that are adding to the banking resources of our country. When prophets of evil croak of an impending financial crisis, they should be asked to explain this significant fact. We are not now discussing the financial position of our Allies; they have fought bravely, and as bravely have pledged their faith to pay these stupendous sums. America has been a generous lender; her sons now are brothers in arms with those of France, England, and Italy; she is certain to be a generous creditor in the days of reconstruction. It

is to the gain of England, France, and Italy that America should be financially strong at the end of the War. Germany hopes to see the rest of the world crippled, so that she may stand more nearly equal with her antagonists in a future commercial vendetta. In this she will be disappointed; America is full of vitality and will sustain her Allies until they recover from the shock of war. On the other hand, we must keep our poise; we must not suffer the high prices of an era of strife to trouble our thoughts with notions of change in the foundations of our monetary system. Gold was at a premium after the Civil War; it has gone to a premium after all great wars in modern times, but it is worthy of note that a larger proportion of the available gold was then in the possession of the people than will be true after the present war. That fact makes a great difference. The possibilities of the credit system may be said to have been discovered since the Civil War. The theory of it dates far back in the history of finance, but the utilization of the principle was on a pigmy scale compared with the gigantic acceptance of commercial paper in recent years, without conscious thought of the gold in terms of which the sums involved in these transactions were measured. The closer drawing together of the nations by steamship and cable communication, by the adoption of similar methods of doing business through banks and bourses, and by treaties establishing international rights and equities, thus creating trust and confidence in international commercial methods, have made possible an enormous expansion of the credit system, with which the output of gold could not keep pace. With mutual faith between the nations, with reliance upon the stability, justice, and honor of the governments themselves, the need of the actual gold was less appreciated. The credit represented goods or valuable services, therefore it in no wise resembled fiat money. It was wholly different from the greenbacks that a verdant political party once thought the Government could issue by the millions to serve as currency. Greenbacks of that kind are not currency, for they will not flow in the channels of trade; they are airy nothings, possessing only a flimsy value, which men instinctively discount, because they are a promise to pay without substantial resources behind them. A hundred greenbacks might pass for a dollar, on faith, but the dollar of reference must be gold or a credit for something worth the dollar that will be acceptable in the market. In consequence of the firm belief that men will recognize the obligation indicated in the credits recorded in the banks, that they will deliver the goods or render the services of equivalent worth on demand, and because of our certainty that democratic governments are not of the kind that may be dissolved by sudden tides of revolution such as have overwhelmed the autocracies of the past, the actual employment of gold was necessary only in relatively small amounts for the settling of international balances. It was enough to know that the government held the coin; that it was guarded more safely than the individual could guard it, but was to be had at any moment, if desired, on the presentation of accredited demand-money. This is the condition today. Though the exportation of gold is prohibited, that circumstance only increases the surety that it cannot get beyond reach; the people are protected. There are Federal Reserve notes in circulation of a face value of $1,711,411,695, for every dollar of which, if any holder wish, he may demand and receive gold at any National Bank, or at any U. S. Mint. There are $704,137,008 National Bank notes outstanding, redeemable in gold at the pleasure of any one who possesses them. Including gold and silver certificates, United States notes, Treasury notes of 1890, silver dollars and subsidiary coin, the redeemable currency of the United States amounts to $4,277,266,666, or a little over $40 per capita. It is interesting to compare this with the redeemable currency of only $10 per capita in 1879. The total gold in the country at that time was barely $6 per capita; today it is $39.50. Who cares for the actual coin under such conditions? We are used to the credit system; our Government is strong and tried; we are content that the gold should be where it is, and as there is no trading in the metal in the open market our credit-money holds its exchange-value unimpaired. If this condition persists gold will not go to a premium. The dentist, the jeweler, can obtain what he needs from the mint; no higher market-price than $20.67 per ounce can anywhere prevail. Accordingly the financial world remains secure against the catastrophe of a demoralized currency. The credit system protects the monetary unit from being misused by the financial jugglers. It is a different thing to juggle with prices, for exaggerated market-values are closely related to expanded capital accounts, and inflated prices will revenge themselves on such capital as gold allowed to go to a premium has never done. Inflated capital, representing augmented investments during this era of increased prices and profits, will revert toward the normal under the reaction to lower prices in the days of reconstruction. It is the indebtedness contracted during such a period that will pinch in the future, and we see that the Government is preparing to cover its own needs largely by taxing excess profits rather than fixed incomes; it is resorting to loans for only the lesser part of its funds. The estimated expenditure from our entrance into the War to the end of 1918 is fifty billions of dollars. Of this sum sixteen billions will be represented by loans, and seven billions of that will consist of credits to our Allies, constituting a basis for industrial expansion in the future. A change in the official value of gold would reduce the purchasing power of that credit, and weaken our financial strength in proportion. This would seem to dispose of the proposition to alter the quantity of gold in the unit of exchange, or, as some have expressed it, to pay more for gold than $20.67 per ounce. We may if we choose, pay a bonus temporarily for new gold produced, but to tamper with the gold standard as now established would be equivalent to discounting the obligations created in the course of international trade, for these constitute a financial safety-valve ensuring stability after the War.

Democratic Control of Industry

The Editor:

Sir—It seems to me that the issue mentioned in the address of Mr. Channing and the letter of Mr. De Kalb is a very important one and worth further discussion by engineers and employers. Mr. Channing, as I recall it, praised some aspects of the much-quoted peace program of the British Labor party. Mr. De Kalb's chief objection to such a democratic control of industry was that an "elective absolutism" such as the proletariat would set up, where equalizing mediocrity would rule, would not encourage the development of the highly specialized types of men that the modern world requires. Engineers should be interested in such a suggestion, for they are highly specialized workers, as should employers, who seek and use men of exceptional development. We have read of the naive proposals of the Bolsheviki at the Russian mine that proposed to take turns at the engineer's job, while he took his turn at shoveling, in order that everyone might have a chance at the easy job, as the workmen saw it, of sitting in an office and sharpening pencils.

Adam Smith, the Scottish economist of the 18th century, showed that a nation's wealth is increased to best advantage when men are spurred to useful effort by letting individual initiative and spontaneity have the maximum freedom and reward. The wonderful development of the railroad industry in our country was the consequence of the throwing open of a free field for able daring men to go as far as they liked. Ultimately this principle of *laissez faire* was overdone, and a number of railroads became bankrupt through the eagerness of the financiers in control to work their individual will as they pleased. The attitude of specialized business-men and professional men toward what they consider meddling by semi-ignorant governmental committees is illustrated by the responses of Mr. Ingalls to the Congressional members, as printed in your issue of July 6.

Carlyle, who was an extremist, but is valuable as an antidote, urged hero-worship of men of genius and exceptional talent, in order to promote capable and inspiring leaders for leavening the dull lump of democracy. While his ideas are not entirely practicable, many other far-seeing men have advised the American people to give genius a chance, to encourage great men, and to sympathize with highly specialized workers who are in a position to benefit the country. A great nation has been defined as one that develops great leaders.

The issue between Mr. Channing and Mr. De Kalb seems to be whether, under a democratic control of industry, such as the British Labor party proposes, there would be encouragement and flexibility for developing highly specialized types. Would individuals perfect themselves by long years of study and adaptation for positions that promised only mediocre rewards? Would an "elective absolutism" have the foresight and tolerance to assist men of ability and imagination to spend their lives in non-standardized effort? Adam Smith proved that individual selfishness benefited the community. Will talent flourish without the individual selfishness that the reformers would banish?

P. B. McDonald.

What is a Dollar?

The Editor:

Sir—A dollar is commonly believed by many to be a certain exchange-value or purchasing power which requires so much of this, that, or the other thing to equal; it seems difficult to describe this notion exactly, but, in the minds of all of us, there is a well-defined idea of what a dollar is worth. Nowadays, it is seen usually in the form of silver or paper. At least such are the forms that are commonly considered to be a dollar; but neither, in fact, is a dollar; the silver piece is a substitute for—and the paper bill is a promise to pay—a dollar.

To digress for a moment: In considering this general subject, it must be borne in mind constantly that all values are relative and that for the purpose of convenience and simplicity it is customary to express values in terms of a unit of value, which has been decided upon for that particular purpose. The word 'price' is used particularly to express the worth or exchange value of anything in terms of the unit of value.

A unit of value is a certain weight of a standard of value. Gold is the standard of value used by most of the nations of the world, and in the United States of America it is nine-tenths pure (or 900 fine, as commonly described); that is, standard gold is an alloy containing 90% pure gold.

The unit of value in the United States consists of 25.8 grains of standard gold, which contains 23.22 grains of fine or pure gold, and this has been called a 'dollar'. A dollar, therefore, is a definite weight of a particular commodity; it is 23.22 grains of pure gold. All other so-called 'dollars' are simply substitutes for, or promises to pay, a dollar.

There are some who are disposed to object to the term 'commodity' as applied to gold; but since, in its crude state and even when made into money, it is invariably sold by weight, it is to all intents and purposes a commodity. The fact that it is used as money has, of course, increased its use enormously and thereby added to its exchange value, but it is a commodity nevertheless. The fact that the Government has stamped symbols or designs on our gold coins adds nothing whatever to their exchange-value; such symbols are, simply, the Government's assay-certificate, certifying to the weight and fineness of each coin.

In further elucidation of what constitutes a 'dollar', let us consider the gold coinage of another nation, Great Britain, for example. The British coinage law requires that twenty pounds Troy of standard gold shall be divided into 934½ parts, or pieces, each of which is called a sovereign, or pound sterling. Twenty pounds Troy weight of standard gold is 115,200 grains, which, divided by 934½, gives a quotient of 123.2744+ gr., and, as the British standard gold is eleven-twelfths fine, each sovereign contains 113.0016+ gr. of pure gold. If a sovereign (113.0016+ gr. of gold) is divided by a dollar (23.22 gr. of gold) the quotient is 4.8665+; in other words, a sovereign is 4.8665+ dollars. It is commonly said to be worth $4.86+, but it is 4.86+ dollars, and being 4.86+ dollars, it must, of course, be worth 4.86+ dollars. To emphasize this point still more; 113.0016+ gr. of gold is 113.0016+ gr. of gold, whether it is called a sovereign, or pound sterling, or four dollars and eighty-six cents.

The so-called silver dollar is not truly a 'dollar', because it is another weight of another commodity; instead of being 25.8 grains of standard gold, it is 412½ gr. of standard silver (nine-tenths fine), or 371¼ gr. of pure silver. At present quotations, silver is one dollar per ounce, which means that 23.22 gr. fine gold is exchangeable in the market for 480 gr. fine silver; and as there are 371¼ gr. fine silver in the so-called silver dollar, the silver in that dollar is exchangeable in the market for $\frac{371.25}{480}$ of 23.22 gr. of gold, or 17.96 gr., and since a dollar is 23.22 gr., 17.96 grains are 0.7734 dollar, or 77.34 cents. Hence, the market-value (bullion-value) of the silver in a silver dollar is 22.66c. less than a dollar. But, when the Government issued a silver dollar to the people, it received from them 23.22 gr. of gold, or its equivalent, in exchange for it; therefore, it maintains the exchange-value of a silver dollar, as money, at a parity with a gold dollar. In issuing these silver dollars, the Government as a matter of fact sold the silver to the people at $1.2929 (30.01+ gr. of gold) per ounce—the coinage value of silver.

It has been stated recently, in the columns of the local press, that this silver cost the Government an average of about 72 cents (16.7184 gr. of gold) per ounce. If that statement is substantially correct, this difference (called seigniorage) amounted to about 57c. per ounce of silver, equal to a little more than 44c. on each silver dollar. The seigniorage, however, was placed in the Treasury as an unappropriated balance for use by the Government.

At the present quotation, 480 gr. of silver is exchangeable in the market for 23.22 gr. of gold; which means that the ratio of silver to gold is 480:23.22, or 20.67 + :1.

Should silver, instead of gold, be made the standard of value, and should 23.22 gr. be called a 'dollar', then an ounce of silver would be 20.67 dollars and, at today's ratio between silver and gold, an ounce of the latter would be worth 423.25 dollars (20.67 times 20.67 gr.).

At four dollars gold for eight hours' labor, a workman is paid today 92.88 gr. of gold, or its equivalent; or 20.67+ times that weight in silver, which is 1920 gr., or four ounces. If, instead of gold, 23.22 gr. of silver is made a 'dollar', he would receive, at the same wage (1920 gr. ÷ 23.22 gr.) 82.68 dollars per eight hours. But, other things being equal, the 82.68 dollars would be exchangeable for only as much food, clothing, etc., as is now obtainable for four dollars in gold, because all commodities would rise in price in direct proportion to the decrease in the commodity-value of the silver 'dollars' as compared with the present gold dollar.

Again, should any other metal, such as lead, be taken as the standard of value, in place of gold, and 23.22 gr. be called a 'dollar', then, as before, a Troy ounce of lead would be 20.67 dollars. A pound avoirdupois, 7000 gr., would be (7000 ÷ 23.22) 301.46 dollars. The ratio of lead to gold at the present price of lead, 7c. per pound (1c. for 1000 gr.) is 1000 to 0.2322, which is 4306.6:1. At this ratio, an ounce of gold would be worth (4306.6 × 20.67) 89,017.42 lead dollars.

In conclusion; as long as the unit of value is a dollar, or 23.22 gr. of gold, an ounce of gold, 480 gr., is (480 gr. divided by 23.22 gr.) 20.67183+ dollars and, as the 'price' of anything is its exchange-value in terms of the unit of value, the price of gold will be 20.67183+ dollars per ounce; in other words, the price of an ounce of gold is an ounce of gold.

It has been stated that, at a recent conference with the Director of the Mint, someone suggested raising the price of gold to $30 per ounce, to help the gold-miner! Thirty dollars is 30 times 23.22 gr. of gold, or 696.6 gr., and the literal meaning of such an act is to pay 696.6 gr. of gold for 480 gr. of gold. This suggestion is a pertinent illustration of the fact that one, at least, of our metal-producers did not realize that a dollar is not a certain purchasing power and that it is, instead, a certain weight of a commodity (gold) that has a constantly varying purchasing power.

As it is impracticable to induce the Government to pay 696.6 gr. of gold for an ounce, 480 gr. of gold, an alternative would be to induce it (the Government) to call 16 gr. of gold a 'dollar'; then an ounce would be $30. This act would make the exchange-value, or purchasing power, of the new gold 'dollar' thirty-one and a fraction per cent less than that of the present dollar. But if this were done, what would happen in the commercial

world? Talk about earthquakes! But, with Kipling's permission, that is another story.

W. DE L. BENEDICT.

San Francisco, July 22.

The Relation of Gold to War Finance

The Editor:

Sir—The attention of the Treasury Department of the United States, of members of Congress, and of the bankers of the country, has recently been called to the serious situation in which the gold-mining industry of America and of the world finds itself in consequence of the increased cost of labor and supplies resulting from the War, and because of the fact that the value of the gold produced, being fixed in price by the Government, therefore enjoys no increase in its market-value. By far the greater quantity of gold now produced necessarily comes from low-grade deposits, in which the margin of profit, even in normal times, is comparatively small. This is true because of the unusual manner in which gold occurs in nature. While it is widely distributed, it is found, as a rule, in minute quantities. High-grade deposits, resulting from unusual concentration, in the nature of things, are rare. In addition to this, the high-grade deposits usually are the first to be found, mined, and depleted. The active and persistent search for gold in the past has resulted in complete knowledge of its occurrence, and in the discovery and exhaustion of the richer deposits; those engaged in the industry and familiar with the habit of gold deposits are agreed that the future of the gold-mining industry and of gold production in the world is now and will hereafter be dependent mainly upon low-grade deposits. Taking this into consideration, as well as the present fixed value of gold and the rapidly rising cost of material and labor, it is obvious that the existence of the entire industry, as now developed, is threatened.

This condition has been developing for the last four years and it has become so acute that the production of gold from the majority of the low-grade deposits is now being made at a loss. Last month 300,000 oz. of gold, produced on the Rand, which is the most productive gold-mining region in the world, was sold to the Government at less than cost, and the same thing is true of several of the largest properties in Alaska, Canada, and the United States. It is inevitable that, unless some form of bonus is given to the producing mines, or an actual increase in the value of the product itself is made by the countries in which gold is now being mined, the large producers will be compelled to discontinue operating and the already decreasing production of gold will be most seriously affected. It is obvious, likewise, that the estimated profits on ore, based on pre-War conditions, on which these enterprises were established, have ceased to exist. Tonnages of developed ore in the mines that were carried as an asset because profit was indicated on the pre-War basis, must be entirely written off under present conditions, and only the richer ore in the operating mines can be carried now in the form of a reserve. In other words, no low-grade gold-mining operation conceived, financed, and developed under pre-War conditions can possibly work out as originally planned, nor can it hope to continue for any length of time unless a bonus is offered by the Government to compensate for the increased operating costs, or unless the value of the gold, as fixed by the Government, is materially increased.

The question, therefore, that presents itself is whether the production of gold is a necessity and whether gold mining is an essential industry. In order to determine this, some of the operators in Alaska, through Mr. Charles Sulzer, the Congressional delegate from that Territory, raised this question with Mr. William McAdoo, Secretary of the Treasury, who, in a letter addressed to Mr. Sulzer, dated June 10, 1918, clearly and forcibly defined the position of the gold-mining industry as next to that of the production of food and ammunition, pointing out at the same time the necessity for increasing the gold reserve of the country to sustain the great structure of credit now being developed in order to finance the War.

The use of gold as the basis of credit and exchange has been so firmly established, it has proved so universally satisfactory, its occurrence in nature, and its physical and chemical characteristics are all such that it may be stated positively that no other commodity compares with it for this particular purpose, and there is no other likely or possible substitute; neither will there be so long as there are separate nations and governments on the face of the earth. All balances in international trade must be paid in some fixed and unchangeable medium like gold. Nations will not accept the paper of other countries in payment for credits unless backed by a proper gold reserve, and, as a rule, they will not accept payment except in gold itself. The necessity for finding a fixed basis for credit became pronounced as international trade developed to large proportions. The first country to adopt gold as the sole standard of values was England and this was later accepted and adopted by all the principal nations of the earth.

One of the most important and interesting questions arising in this discussion is the value of gold as now fixed and accepted by the leading nations of the world. The price of pure gold in our standard of money is fixed at $20.67 per ounce. This value was arbitrarily fixed by the Bank of England when England decided that it was advisable to fix the value of gold in order to standardize exchange. Prior to this, while England had adopted gold as a standard, she had been in the habit of purchasing gold in the open market at a variable range of prices. This necessarily affected, from day to day, and from purchase to purchase, the very basis of exchange. Hence the necessity for establishing a fixed price.

It is generally conceded that the price as fixed was taken from the last purchase of gold made by the Bank of England in the open market. This, in our money, as stated above, happens to have been $20.67. Shortly after this, the other leading nations accepted that gold stand-

ard, and likewise the price that had been fixed arbitrarily by the Bank of England and sustained with the approval of the British government. The important fact regarding this, so far as the present discussion is concerned, is that the price as fixed was purely arbitrary. Even if measured in the currency of the time at which this occurred, when gold was estimated to be worth $20.67 per ounce, it is evident that the great increase in the demand for this product and the increased cost in producing it, makes this valuation now incorrect and decidedly too low. Accepting gold as a basis of all credits, there has never been a period in the history of the world when the demand has been so great as now, in order to sustain a reasonable reserve against the Government issues of bonds, certificates, and other forms of obligation.

E. M. Patterson of the University of Pennsylvania, discussing our national financial situation, points out that "although the amount of gold held by the Federal Reserve banks has almost doubled, the ratio of gold to net deposits and Federal Reserve notes combined, has fallen in the past year from 83 to 61%." The quantity of gold coming into the United States, and now held by the United States, was doubled because of the tremendous quantities of war materials and supplies sold to foreign governments that had to be paid in gold; in consequence, this gold, heretofore held in reserve by England, France, and other countries, found its way to this country.

It is unlikely that this condition will continue, now that we have entered the War, for our large armies in France require huge expenditures and purchases made in foreign countries that must be settled in gold; and, as Mr. McAdoo has pointed out in his letter to Mr. Sulzer, we are, at least for the time being, compelled to pay for our purchases from neutrals in gold because we require all of our own supplies and therefore have no balance of trade with them. Considering this fact and that the productive gold mines of the country will be compelled to discontinue operations unless assistance is given, it can be seen that the gold reserve held by the United States, because of the necessity of additional issues of new bonds, certificates, and other paper, in order to finance the War, will suffer a further and material decrease in the immediate future. As a matter of fact the United States is paying out today gold to neutrals for purchases at a fixed value considerably less than the cost of producing it.

The international phase of this question apparently has been overlooked; it has a direct and important bearing on the War itself. As pointed out by Mr. Hennen Jennings, consulting engineer to the U. S. Bureau of Mines, 91% of the gold and the chief gold-mining districts of the world are owned or controlled by the Allies —France, England, and the United States. Approximately 1% only is owned or controlled by the Central Powers, and 9% is in the hands of neutrals. This is not alone an interesting fact but one that, if properly utilized as a war measure, can yield a great advantage to the Allies in affecting the credit structure of the Central Powers.

It is well known that the issue of paper credits by the Central Powers to their own people and to the adjacent neutrals has been necessarily in far greater proportion to their gold reserve than in the case of the Allies. So long as these countries are dealing among themselves only and are unable to engage in international business, and just so long as their governments remain strong enough to compel the peoples of the Central Powers to accept such paper on its face value, their actual gold reserve is not important; but the instant the War is ended, and the Central Powers are again compelled to enter foreign trade in order to replenish their exhausted supplies of material, their paper-credit will have to be maintained by a gold reserve, else it will fall to pieces, causing a tremendous financial disaster. The German financiers are aware of this, but expect to build up their gold reserve through their ability to sell material and supplies in the world-market at a less cost than they can be produced in the Allied countries. There is grave danger that this condition will actually develop so far as this country and the Allies are concerned, because one of the results of the War has been greatly to increase the cost of labor, that is, labor has demanded, and received, much higher wages, approximating 100% above the average before the War. As a net result the cost, in gold (in the United States at least, and, to a lesser degree, in England and France), of producing commodities, has increased approximately 100%. Pig-iron is selling at $33 as against $15 before the War, and the cost of almost every other important commodity has risen in like proportion. The danger from this lies in the fact that the Central Powers, and Germany in particular, have not increased the wage-scale in like proportion; so that the cost, measured in gold, of producing all articles in Germany after the War, or even now, is less than it is in this country—very much less. The German financiers have boasted of this repeatedly. It amounts to the same thing, on the part of Germany, as placing a premium on our gold supply, such premium being equivalent to the difference in the average cost of labor between the Central Powers and the United States and her Allies.

While tariffs and trade agreements may be developed and arranged to offset this difference in some degree, the easiest, the most sensible, the most practical, and the quickest way to place German labor and industry on a parity with that in the United States and the Allied countries, will be arbitrarily to increase the value of gold in an amount sufficient to offset the average difference in wage-scale existing between the Allies and the Central Powers at the present time. This is possible only because of the conditions mentioned before, namely, that 91% of the gold and of the gold-producing mines of the world are controlled by the Allies, and less than 1% by the Central Powers. It is evident that the governments of the Allies that control this gold resource would have to do twice the amount of work and sell twice the quantity of material in order to obtain the gold supply necessary

to establish a proper reserve against the paper-credit structure that has been developed by them on account of the War. In other words, the governments of the Allies would compel Germany to pay twice as much for her necessary gold supply.

It has been argued that such change in value of the basic metal, gold, would derange the structure of credit, but this can be obviated by agreement between England, France, and the United States, the countries that control the gold supply of the world, and also by suitable legislation in their respective countries.

It would be necessary, of course, first for the governments not only to withdraw all gold coinage and hereafter command the entire existing supply, also to command all the gold to be produced in the future. In a large degree this has already been done, as gold coins are rapidly going out of circulation. The issue of the Federal Reserve certificates is an illustration of what would take place in lieu of the issuance of gold coinage. It would not derange the value of the gold currency as issued, because it is apparent that the value of gold behind this currency is in any case arbitrarily fixed by the Government. For instance, if the governments arbitrarily agreed that gold should be fixed at $40 per ounce instead of the present fixed price of $20.67, the owners of certificates or bonds will receive half as much gold as they would now receive in redeeming their paper; but if half an ounce of gold is worth twice as much as it is now worth (and this would be the case) there would be no actual derangement or change in the value of the currency of paper issues. In other words, half an ounce of gold worth $40 would be just as satisfactory to the holder of paper as an ounce worth $20.67, because in both cases the value itself would be fixed arbitrarily by the Government. Moreover, this value would be more in keeping with the actual value of the gold as produced.

Fineness has to do only with the purity of gold. The fixed price of $20.67 per ounce, as now established, refers to pure gold only. Gold of less fineness than pure gold is obviously worth less than $20.67 per ounce in proportion to the quantity of other metals contained therein. For instance, in the $20 gold piece as now issued, there is not quite an ounce of pure gold, the difference between the $20 and the $20.67 consisting of copper added for the purpose of making the coin harder and more serviceable.

While my suggestion may seem radical, it is interesting to note that the gold-producers of the British Empire called a meeting on July 4 and appointed a committee of six to bring such a proposal before the British government.

So far as the United States is concerned, the first and immediate necessity is legislation that will permit the continuance of the present gold-mining industry. This can be accomplished temporarily by establishing an adequate bonus sufficient to offset the increased cost of labor and materials. A second step would be the formation of an international commission to act jointly with the committee now formed in London and with proper representatives of the governments for the purpose of re-establishing a fixed price for gold commensurate with present conditions, and finally, the enactment of such legislation as will protect all paper issues that have been made on the present gold basis, and the taking of such steps as are necessary to see that the international gold assest controlled by the Allies is properly used in order to place the Central Powers on a parity with us so far as the cost of producing material is concerned. In this way they would be prevented from drawing out the gold supply of the Allies through neutrals by selling materials in the world-market at a lower gold cost.

It is to be hoped this discussion may lead to immediate legislation to protect the gold-mining industry of the Allied countries and take full advantage of the control of this metal by them, in dealing with the credit structure of the Central Powers. Given the knowledge and the fact that the United States and her Allies actually control 90% of the gold and gold-producing areas of the world the questions arise:

1. Why should we continue to pay for supplies purchased from neutrals in gold at less than the actual cost of production?

2. Should not the United States and our Allies immediately recognize this great international asset and take all necessary steps to prevent Germany and the Central Powers from entering the world markets, and thereby draining from the United States and her Allies the gold with which to preserve the paper-credit structure that had been developed for the purpose of carrying on the War against us?

3. Why should the gold-mining industry, as established, be compelled to sell its product at a price less than that which it is actually worth?

B. L. Thane.

New York, July 18.

Cooperite is a new high-speed alloy developed in England. It is said to be an alloy of zirconium and nickel. It has a bright silvery lustre and a specific gravity much lower than other alloys used for high-speed work. Cooperite contains no carbon or iron, and, consequently, is not a steel. Its melting point is only about 1150°C., and owing to the fact that the alloy remains in a liquid state for a considerable period before solidifying, difficult castings can be made with ease. No heat-treatment is said to be required, the hardness being varied by changing the proportion of the constituents. Cutting tools have been produced with a hardness of 250 up to 500 Brinell, the latter still retaining sufficient toughness to withstand heavy roughing cuts.

The Parker rust-proofing process consists in cleansing the iron or steel by sand-blasting, followed by pickling or immersion in Na_2CO_3; the object is then dipped in a solution of acid meta-phosphate of tungsten or molybdenum; and finally the metal is treated with a special oil, whereby a soft, black, dull finish is obtained.

Correction of Stadia-Readings to Horizontal

By E. A. BYLER

This table gives the corrections to be subtracted from the rod-readings for each hundred feet, from 100 to 900. The corrections for tens is obtained by removing the decimal point one place to the left; for units, two places to the left.

The table is accurate, and by interpolation the correction may be made within the limits of the decimal places given. However, for the usual purposes for which stadia-observations are used, such as topography or mapping, results to the nearest foot or possibly 0.5 for short readings is all that is desired and the corrections can be taken out quickly by inspection, without interpolation, giving results well within the limits of observation.

For moderate vertical angles it will be sufficiently close to take out the correction to the nearest 10 ft. of rod-reading and to the nearest vertical angle given, so that a mental addition of two numbers (for the tens and the hundreds) will give the correction to be subtracted from the rod-reading.

If desired to make correction for focal length, it may be made by adding to the result the focal length of the particular instrument without correction for vertical angle. This will be sufficiently accurate.

If the distances are long, closer results may be obtained by interpolating between the vertical angles given.

At 20° the correction for 5 ft. is but 0.6, so that it is seldom worth while to take out the correction closer than to the nearest 10 ft. of rod, unless possibly, in the case of very steep angles and short distances.

A little practice with the table will enable one to know at what point to make the interpolation in order to have the results within the limits desired.

As little calculation is necessary the table facilitates the quick reduction of observations.

Horizontal Corrections for Stadia Readings.

THE PRODUCTION OF ELECTROLYTIC IRON in France, as a result of the scarcity of Swedish iron, has led the Firminy Steel Co. to install the Burgess process for the production of electrolytic iron at its Rioupéroux plant. The ultimate capacity of the plant will be 25 tons of electrolytic iron per day, at 50 francs per ton. The electrolyte remains fairly constant for a long time. Iron anodes, in a solution of ferrous ammonium sulphate, with a little ferrous chloride, are used. The current density is 1 amp. per square decimetre. The mean analysis of the Rioupéroux electrolytic iron is: C 0.015 to 0.064, Si 0.004 to 0.02; Mn trace, P 0.002 to 0.009, S 0.001 to 0.007%. For a detailed comparison of the various electrolytic-iron methods see Aimé Coutagne in the Bull. Soc. de l'Industrie Minerale, 1917, No. 3.

WHERE MR. CALLOW WAS BORN; A TYPICAL ENGLISH HOMESTEAD

John M. Callow—Engineer and Metallurgist

AN INTERVIEW, BY T. A. RICKARD

You were born in the old country?

I was born in the village of North Repps in the county of Norfolk, within sound of the North Sea.

At what date?

July 7, 1867.

Was your father connected with engineering?

No, my father was a large farmer and a land-owner, so that I was a farmer's son.

What was your early education?

The ordinary English grammar-school education until I was 16. Then I was articled as an engineer to a firm of engineers in the city of Norwich.

You supplemented your apprenticeship by further study, I presume?

I did, taking an engineering course in the Norwich School of Art, the South Kensington examinations in applied science. This entailed a great deal of study by night and my health suffered, so that our family physician advised my father to send me on a sea voyage. He bought me a ticket on a sailing ship for Australia and gave me a letter of credit for about $500. I sailed for Australia in the year 1885 on the sailing ship 'Superb,' which was one of the old Black Wall liners, and was originally an East India troop-ship. The voyage was full of experience for me, as we were two weeks beating down the English Channel to Plymouth, where I got my first 'sea legs,' and we were three and one-half months from Plymouth into Melbourne harbor.

Did you try to get employment?

Not at this time, as I still had some funds. I visited the mining camps of Ballarat and Clunes and saw my first mining. From there I went on a visit to Tasmania and stayed for some weeks at Triabunna Bay on the east coast, close to the old convict settlements of Maria island. From there I went to Sydney and afterward to Brisbane and the Darling Downs district; from there to Townsville and from there to Charters Towers, where I met a man from my own village.

Did he help you?

Yes; through his kindness, I spent some weeks on a cattle station on the Burdekin river among the Myall blacks.

You did not go to the mines at Charters Towers?

I visited all the principal mines at Charters Towers,, and I remember also, the small smelter at Ravenswood.

About this time, I was 'broke,' so I sought employment, and got a job in Plant's mill.

Do you remember the name of the mine?

No; my recollection is that it was a custom mill.

Probably the Day Dawn, for I can tell you that I met Mr. E. H. T. Plant at Charters Towers four years after the date you mention, by which time the Day Dawn had become a big mine. Mr. Plant was also a director of the Brilliant Gold Mining Co., which ranked first among the gold-producers of Australia. What was your job?

Just a roustabout around the mill. This was a small stamp-mill employing amalgamation followed by Berdan pans and Gilpin county bumping tables.

I doubt that. The Gilpin county bumping-table was not known in Australia at that time, but they had a machine called the Halley table, which needed a small boy to look after it; from our point of view, it was ridiculous in requiring the constant supervision of a small boy to remove the concentrate. Did you become interested in your work?

Of course. All this work was of much interest to me because of my training as a mechanical engineer. After working at Charters Towers for about two months, I received a welcome remittance from my father, with instructions to be sure to come home and finish my education. I had just enough money then to take a passage from Townsville back to England, this time in the steamer 'Dacca.' We called at Bowen, Thursday island, Batavia, Colombo, Aden, Suez, Port Said, and Malta. It was a wonderful voyage, lasting two months. The scenes and events were impressed on me indelibly. The 'Dacca' soon afterward went down in the Red Sea, but I landed safely at Tilbury dock on October 4, 1886, dressed in true Queensland fashion and with a miscellaneous collection of souvenirs, including boomerangs, spears, and a Maltese poodle. I went back to work with my old firm, Riches & Watt, at Norwich, staying with them until I was 21, by which time I had completed my apprenticeship.

So now you were ready to make a new start?

Yes; but having seen something of the world on my Australian trip, I was anxious to see more of it; therefore, on the first excuse, I sailed, in October, 1888, for New York, heading for Colorado, where I had relatives. My health still was none too good, and the doctors advised me to lead an open-door life for a time, so I went to Eaton, about 60 miles north of Denver, and, having a little money, I went into partnership with my cousin, as a renter on 80 acres of land—he to do the work, and I to furnish the money. We 'batched' in a tent in summer and a dug-out in winter. The venture was so successful that I decided to buy some land, and I bought 160 acres of raw land with water-rights from the Colorado Mortgage & Investment Co. and immediately went to work to improve it. Here I learned to ride, to drive a four-horse team, to plow, irrigate, and other rural accomplishments, and for two years followed the regular life of a farmer. I had this farm for 13 years, and it proved a successful investment. During my stay on the farm, I ran across Mrs. Mary Lease, 'the Kansas cyclone,' a political lecturer, and one of the main expounders of the Farmers Alliance doctrine. I accompanied her on her lecturing tour through that part of the State, and she influenced me to stop farming and go back to my profession, which she thought offered me a better scope. Shortly afterward, happening to be in Pueblo, I called on the Stearns-Roger Manufacturing Co. and met Mr. John Roger, who gave me my first job as a draftsman. I stayed there a year; then, the farm having been quite successful, I decided to go home. Before returning I was married to Miss Roberta A. M. More, whom I had long known and who was a sister of an old friend of mine, Thomas More, a pupil, like myself, of the engineering firm at Norwich. We settled at Denver, and I went back to work for the Stearns-Roger Manufacturing Co. in its Denver office in 1893. Here I first got acquainted with Mr. Stearns, and, I am proud to say, we have been good friends ever since. Unfortunately, the silver panic of 1893 affected the firm, as it did everybody else, so that they had to decrease their force, and I had to shift for myself again.

Yes, I know all about the silver panic, because it hit me in the same way. What did you do?

For a year I did practically nothing, except odd jobs as a draftsman around Denver, but in '94, I went to work for Mr. Philip Argall in the designing of the Metallic Extraction Co.'s works near Florence, Colorado. By the way, I also wish to say that on and off I worked for the late Henry Vezin, whom I held in great esteem, and from whom I benefited greatly on account of his wide technical knowledge. Here I may also record my many obligations to Mr. Argall, and the experience gained under his direction.

Did you have anything to do with the running of the metallurgical cyanide plant?

No. I left before the large plant was completed, and got into a mining venture in San Juan county, near Silverton.

What was the name of the mine?

It was owned by a company known as the Golden Horn, operating in Ice Lake basin, overlooking Ophir. Some of my English relatives and friends had put up the money. We built a mill and worked the mine to a limited extent, operating for a time with pack-trains.

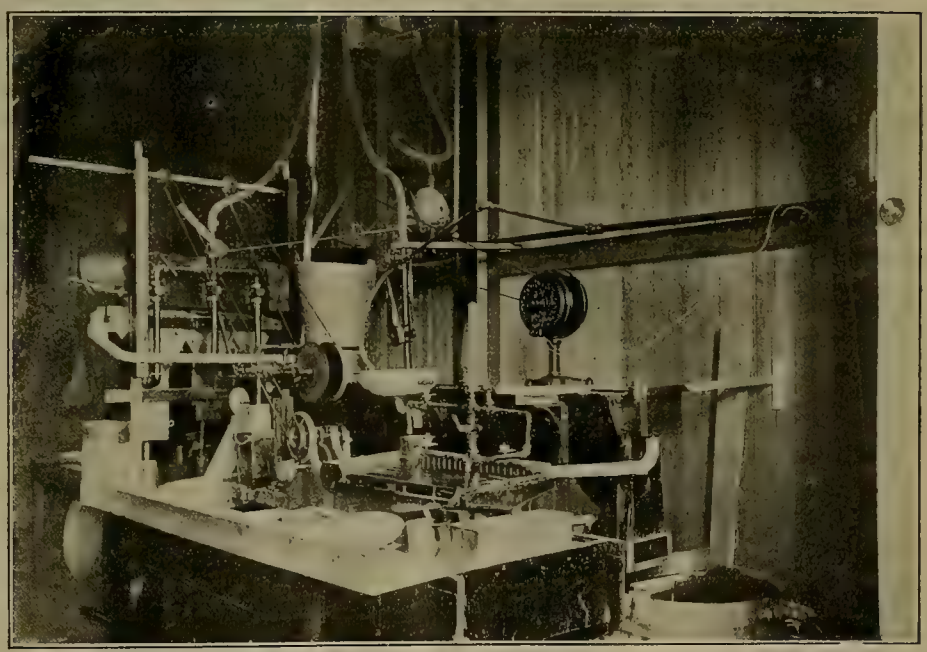
Shipping concentrate?

Yes, shipping concentrates to Durango, and bullion to the Denver mint. The venture was not successful, owing to limited capital, but I obtained much valuable experience in the rudiments of mining. I still own the property, and expect its value to be appreciated some day. My wife and I had many interesting experiences there, for we lived at the mill, which was just below timberline.

That would be 11,000 ft, would it not?

The mine was at something like 13,000 ft. and in a

MR. CALLOW AS AN IRRIGATOR IN COLORADO



THE ORIGINAL TESTING-PLANT WITH WHICH MR. CALLOW STARTED HIS BUSINESS

wild and snowy country, and the mill some 2000 ft. lower. After the shutting-down of this enterprise, I returned to Denver and soon afterward came to Utah for the purpose of re-designing the old Highland Boy cyanide mill into a concentrating plant. This put me in touch with Mr. Thomas Weir and Mr. Samuel Newhouse, both of them energetic and well-known mining operators in the West. I joined the staff of Mr. Newhouse and did some of the early experimental work on the ores of the Boston Consolidated, at Bingham, and of the Cactus mine at Milford. Later, I was designing engineer for the Annie Laurie Mining Co., operating in Sevier county, Utah, owned by P. L. Kimberly. This was a dry-crushing cyanide plant and followed Cripple Creek practice as laid down by Mr. Argall.

So you had some of the earliest experience in the treatment of porphyry ores?

The Bingham porphyries were just beginning to attract attention and I set up a little laboratory in the Dooly block to do jigging and panning tests on this ore. It was soon evident that the mineral was much too finely disseminated for a jigging operation, and the flow-sheet that I finally developed was one employing fine crushing and tables.

What kind of crushers and what kind of tables?

We proposed to use rolls followed by Chilean or Huntington mills, thence to hydraulic classifiers and Wilfley tables, thickening the slime in tanks and finally treating it on vanners, which were, at the time, the only machines adapted to the work. The recoveries, as I remember them, were around 75% and yielding a 30% concentrate from a 1.3% ore. I remember drawing up plans along these lines for the Boston Consolidated company, but they were never executed. At about this time I met Col. E. A. Wall at Bingham. He was then prospecting the ground now owned by the Utah Copper Company and was testing the ore in the old Rogers mill in Bingham canyon. I remember well his enthusiasm and faith in what was then facetiously known as 'Wall-rock'—a faith which in later years has been more than justified. Later on, Mr. Jackling repeated these tests in the same mill and eventually launched the Utah Copper Company and built the experimental plant at Copperton. About the same time, I was constructing the Yampa smelter for George Robinson, Jim Neill, and their associates. George Robinson has since 'gone West,' but Uncle Jim is still very much alive and a much esteemed friend.

What did you do at the Cactus?

I tested the ore, prepared the flow-sheet, and designed the mill, which was built by Mr. Bettles.

This mill was based on your own experimental work.

Yes, it was. The flow-sheet consisted of rolls, jigs, tables, and vanners.

When did you invent the Callow cone?

At about this time. I found the necessity for some settling device in mills employing fine crushing, and I had long appreciated the necessity for getting the slimy pulp to the proper density in order to do good work on the desliming machines. The first Callow tank was installed in the Cactus experimental mill, which I erected close to the mine for the purpose of testing the flow-sheet that had been planned in the laboratory.

Did you invent or design any other mechanical improvements?

About this time, I began to appreciate the great importance of sizing for table work. Out of this grew the invention known as the Callow screen, which is a traveling belt of screen-cloth on which pulp is spread, the oversize being retained on the traveling screen and the undersize passing through the meshes. These two devices—the screen and the tank—I turned over to the Galigher Machinery Co., as manufacturer and agent, and for some time, personally pushed these two inventions. They have had a wide application and served a useful purpose in their time. The Callow tank, of course, has since been replaced to a large extent by the Dorr thickener, and the screen, while still of considerable value in some positions in mills, has been set aside as a sizing scheme by the developments that have taken place in the roughing system of concentration.

How long did you remain with the Newhouse organization?

I must have been with Newhouse for two or three years, and then I set up in business for myself at Salt Lake City, in 1906, under the name of the General Engineering Company. We erected our own building and went into the regular ore-testing business. Shortly afterward, my brother Frank and Ernest Gayford became associated with me, we having all been school-boys together.

In connection with your testing operations, you must have gathered a great deal of technical information?

Yes, from the time I started with the Stearns-Roger company until now, some 14 or 15 years had elapsed, during all of which time I had been very active—to an extent, of course, impossible to detail here. I had long appreciated the importance of test-work preliminary to full-scale operations and had realized that the many failures to be seen throughout the country were due to the lack of testing, and that by the application of scientific knowledge and skill in the early stages, most of these mistakes could be avoided. It seemed to me, therefore, that a testing plant, and work of this kind, would offer a good opportunity for business, as well as the acquirement of useful information.

When did you become interested in flotation?

In the year 1909. Of course, I had become cognizant of the subject from reading the technical papers, and, afterward, from the introduction of the process at the Butte & Superior mill, in 1911.

But surely, you must have heard of the early attempts with the Elmore process, because Butters had a plant in Salt Lake City.

Yes. That reminds me; at about this time, I made the acquaintance of Stanley MacQuisten, and we did a large amount of test-work for him with his tube, which was a

most ingenious device, and quite effective on some kinds of feed. From the MacQuisten tubes, we were led to experiment with agitation flotation; we built machines and tried them in our laboratory, obtaining results that

THE GOLDEN HORN MILL

gave us a proper appreciation of the possibilities of this process as compared with gravity slime-treatment.

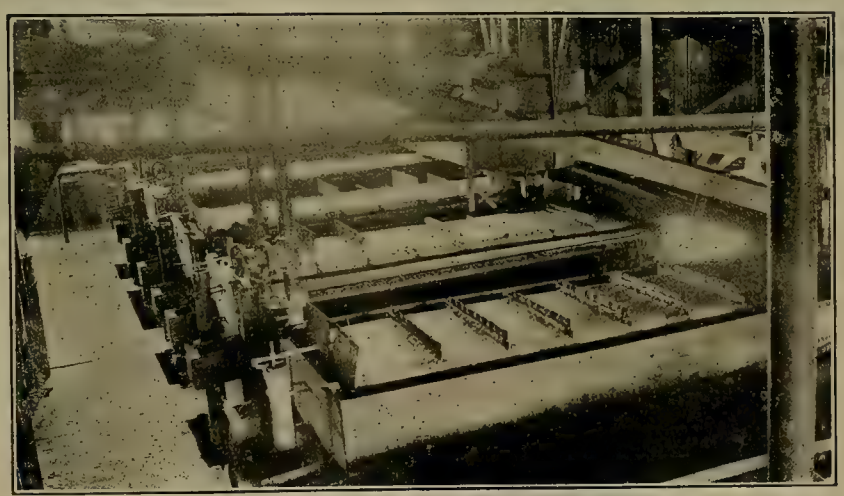
So that caused you to experiment further with the agitation-froth process as distinguished from the old methods of MacQuisten and Elmore?

Yes. I soon realized that the principal feature of the froth process was the introduction of the air, for to a man of mechanical instincts, it was self-evident that the propeller was a most clumsy method of accomplishing the purpose. A few years previous, I had occasion to design a filter employing a porous brick for the aeration of cyanide solutions, and this suggested the porous brick as a medium through which to introduce the air into the pulp for the purpose of making bubbles. Remembering that William H. Creden of the Davis-Daly Copper Co., of Butte, had one of these bricks in his office, I telegraphed to him for it, put it in the bottom of a square wooden box, and introduced a pulp that we had been endeavoring unsuccessfully to float in an agitation machine. The result was startling in its simplicity and complete success.

Was this air introduced under pressure?

Yes, it was, from a small compressor that we had in the basement, at about two pounds per square inch, as I recollect. We then got busy designing this type of machine. The first machines were circular with a porous brick in the bottom. We soon found that the sand tended to settle on the bottom of the brick and blind it. Then came slow-speed revolving stirrers to keep the sand in suspension. It was soon found that the circular machine was wrong in principle in that it was impossible in this type of machine to avoid a short-circuiting of the tailing to the tailing-discharge, and that the logical type of machine was an elongated box or launder. Out of this developed the machine which I eventually installed at the National Copper plant at Mullan, Idaho, in March, 1914.

At this time, you were unaware of the British patents obtained by T. J. Hoover in 1910 and also of the experimental work done by Robert S. Towne?



CALLOW CELLS IN THE NATIONAL MILL, AT MULLAN, IDAHO

Of course, I knew of Mr. Hoover through his book, and of some of his earlier patents; but at this time, I had never seen and knew nothing of any of his British

patents. Mr. Towne I had never heard of, and I knew nothing of the researches of either of them.

So you proceeded to design a flotation plant using this aeration device in the National mill?

Yes. Our experiments with this type of machine in the laboratory on the National ore had been so satisfactory and so conclusive that I decided to take the chances of introducing this type of machine into the National plant. It was a big chance to take, as the whole success of this mill depended upon flotation. Everything proved my judgment correct.

Please state the composition of the ore.

The ore was an extremely hard quartzite, impregnated with chalcopyrite, some chalcocite and bornite, together with iron pyrite. It required grinding to 60-mesh in order properly to liberate the copper mineral. My company designed and erected this plant; we started it in April 1914, and, barring the usual week or two for tuning up, it was a metallurgical success from the start. The operation of the flotation cells exceeded our most sanguine expectations. The plant caused more or less of a sensation and was visited by all the prominent mining and milling engineers in the West.

By this time, you had applied for patent?

Yes. I applied for my first patent in September 1914. This reminds me that I have left out part of my story. In 1911 and 1912, I was consulting mill-engineer for the Inspiration Copper Company and had done all the original test-work in a plant I had built for them at Miami. After the gravity-concentration tests were all completed, the question of flotation came up, and they asked me concerning its merits. The Minerals Separation company erected some of their machines in my old test-plant at Miami, and this eventually led to the adoption of flotation as the primary process for Inspiration ores and the abandonment of our old gravity flow-sheet.

Did you also experiment with flotation at the Inspiration?

Yes, later the Inspiration company built a larger and entirely new test-plant on their present mill-site and in this I set up a complete Callow equipment to go into competition with the M. S. machine.

Did you also experiment with flotation at the Inspiration company's first plant?

Yes, I put in an equipment at the Inspiration test-mill to go into competition with the M. S. machine. Here we fought for about a year with the M. S. and also with the Cole-Bergmann, the Towne, and the Flynn machines—the result of which was that today they are using machines of the type designed by me. I take pleasure in stating that the Inspiration company has recognized my invention and has paid for all the tonnage that they are now putting through their mill.

Meanwhile, what was the National mill doing?

The National mill did excellent work, the recovery running as high as 80%, with a 20-25% copper concentrate. Unfortunately, the mine was not able to furnish sufficient ore for the mill and it shut-down after about a nine months' campaign. Since then, it has, at various times, started up, and I believe is again running satisfactorily, using the original flotation plant in every essential respect as we put it in.

Mr. Callow, are you still using canvas as your porous medium for the bottoms of your flotation cells?

Yes, canvas is still the porous medium through which we introduce the air in pneumatic flotation, but owing to the increasing price of canvas and the difficulty of obtaining supplies, and some other weaknesses inherent to this material, there is a tendency to go back to my original porous brick, and some of the mining companies have done a good deal of experimenting with porous bricks made from portland cement and sand, with varying success. We, ourselves, have made some hundreds of experiments in the development of a suitable porous-brick medium, which will soon take definite shape, and which will have much more strength and greater porosity than any other medium now in use.

How do you regard the future for flotation?

I think the future offers tremendous opportunities, both in the way of improvement in the mechanics and also in the technique of the art. I am satisfied that pneumatic flotation will eventually cover the great bulk of the field. On some complex ores, it may still be necessary to use violent agitation as one of the tools with which to work, but for the majority of ores, the simplicity, efficiency, and low cost of operation will render pneumatic flotation pre-eminent.

Do you expect to see the use of the process extended to ores not now treated by flotation—for instance, will you not say something about the treatment of oxidized ores?

Flotation already covers nearly all classes of ores, not only of the base, but also of the precious, metals. For the treatment of oxidized ores, flotation may find a limited application, and further research may extend this field. At present the sulphide filming of oxidized ores by the use of a soluble sulphide seems only to be successful on the carbonates of lead and copper, the recoveries on the silicates and oxides being poor. There is an immense field for sulphide filming if we could once discover how to film the silicates and oxides, but at present this is not known.

In the course of your many experiments and tests, have you obtained any idea of the factor essential to floatability.

With two out-standing exceptions—coal and graphite—all the most easily floatable minerals are sulphides, or, if oxidized, must be coated with an artificial sulphide, which would indicate that sulphur is a necessary constituent, at least, of the surface of the mineral to be floated.

How about scheelite?

We have not been successful with scheelite, or any other unfilmed oxidized minerals, although graphite floats readily, and this exception to the generalization I

have just ventured to make lead one to suspect that the floatable properties of a mineral were not solely dependent upon their being sulphides, but upon their lustre. On the other hand, cinnabar, which floats readily, has this sulphur constituent but lacks a metallic lustre.

Native gold and silver are floatable, to a limited extent, but it is difficult to say how much of this is due to their entanglement with the accompanying sulphides and how much to their inherent flotative properties.

Native copper is being floated in the Lake district, when in a finely-divided condition, but even then, it is difficult to float. There is no doubt, however, that the sulphide minerals are more easily floated, which leaves us in a dilemma as to whether sulphur is a necessary constituent, or merely coincident to a lustrous surface.

Naturally, you must be pleased with the recent decision of the Ninth Circuit Court of Appeals in the Butte & Superior case?

I am, of course, because it confirms the stand that I have always taken in this matter.

By the way, you recognize the great number of possible flotation agents, and I presume that you have tried most of them yourself?

Yes. I have tried every likely flotation agent, and a great many unlikely ones, either in our laboratory in Salt Lake City or at our research department in the Mellon Institute at Pittsburgh. They would number many hundreds. From all those mentioned in the many patents and from others, my opinion is that it is only a matter of time when 'oil' (as we call it) may have to take a second place as a flotation agent. Our experiments and experience with alpha-naphthylamine and other allied synthetic compounds is sufficient to justify this statement. They have upset, in a great measure, many of our previous oil-flotation theories.

Of course, the successful use of plain sea-water for floating the kind of copper ore common along the coast of British Columbia and Alaska upsets all preconceived notions that oil was essential to flotation.

This is quite true, and opens up some interesting speculations. The use of salt is not new to us, as we have used it off and on for a long time. So far as our experiments go, it is restricted to the treatment of pyrrhotite ores and the selection of the copper from the iron minerals. The same, of course, can be done with oils or other mixtures, but that is beside your question.

Mr. Callow, does your family include any future mining engineers?

I have three daughters, and one son, who has strong mechanical instincts, and I hope that he will in time join the ranks of the profession, and improve on what I may have done.

THE NATIONAL MILL, AT MULLAN, IDAHO

AN ACID-PROOF ALLOY that is highly resistant consists of 47% copper and 5% tungsten. It is also mechanically strong; and it possesses great electric resistance. An alloy of 50.5% nickel, 43.65% copper, 3.9% tungsten, and 1.87% iron is recommended also.

The Importance of Gold Production

By Sir LIONEL PHILLIPS

*In considering the chief cause of higher working costs on the Witwatersrand goldfield we are confronted with a situation that appears anomalous in some respects. The War has had a very serious effect upon the gold-mining industry of the world. Western Australia has suffered even more grievously than we. Why have wages and stores risen? Largely because they are paid for in a paper currency that, owing to inflation, has depreciated. If there had been enough gold to pay for the balance of external trade in the precious metal, exchanges would have remained normal and the creation of paper money, to transfer the predominant part of internal trade from the ordinary channels into the hands of the Government, would not have caused the great depreciation that we have witnessed in its value. We are in a vicious circle. A rise in commodities involves a rise in wages and vice versa, and thus the snowball of national debt goes on growing from the double cause of expenditure and rising prices. Every thoughtful economist looks at the future with grave misgiving. Debts incurred upon commodities at a high cost must some day be paid for in commodities. The higher their price the less in quantity needed to square the account. On these premises, the greater the inflation and the higher the value of commodities, the easier the extinction of debt. Unhappily the reverse of this reasoning may have to be faced. A time may come when the supply of commodities will exceed the demand and depress prices. We live in a competitive world and shall hence have to meet our obligations in commodities at the cheapest rate at which they can be supplied from any part of the globe. For the extinction of external debt there is only one substitute for commodities—gold. And again, sufficient commodities for the re-payment of huge debts can only be produced, or for that matter absorbed, in the course of many years, and the deferment in the payment of debt during that period can only be secured, at fair rates, by credit based upon gold. We have all read a good deal of specious argument on the subject of the gold standard and its abolition, but the fact remains that, although reputation for national probity is of great worth and permits delay in settling debts, no amount of confidence in the integrity of a debtor and no amount of sophistry about 'liquid wealth' in the shape of raw materials and an industrious population will pay debts. Hard cash, goods, or services of a valuable character are the only considerations acceptable to the creditor. These are the reasons why the gold output has been, and still is, of such vital consequence. The British Empire produced last year £56,139,030 out of the total world output of £87,983,130, or 63.8%. The standard price for fine gold here is roughly 85s. per oz. Its varying value is not expressed in a rise or fall in the value of the metal, which fluctuates infinitesimally, but in the rise and fall in the price of commodities and in exchange rates between different centres. Rates of exchange have little to do with the wealth of a country; they mainly represent the state and tendency of trade-balances. The movement of a relatively small amount of gold has a surprisingly large effect upon rates of exchange.

It is not my intention to grapple with the abstruse subtleties of the currency question. The consideration of that problem was entrusted to a committee at the beginning of the present year, under the chairmanship of Lord Cunliffe—until recently Governor of the Bank of England—with a number of distinguished gentlemen, two of whom are connected with the Treasury, eight of whom are bankers, three members of great financial houses, and one a professor of political economy. It is a body whose conclusions will undoubtedly be treated with respect. The currency question, however, certainly deeply concerns the gold-producing countries of the Empire, and it is rather surprising, therefore, that no representation of their interests was given upon the committee. The interests of the gold-producer and those of the banker or merchant are not always identical. In a recent letter from Mr. Samuel Evans, the managing director of the Crown Mines, who has given a great deal of able thought to the question, this aspect is presented in the following terms:

"The business of bankers is to deal in money, money in all forms, and, consistent with the maintenance of confidence, the more money—not only gold, but also paper— there is to deal in, the more profit they can make for their shareholders. The annual reports of the leading English banks show that, on the whole, 1917 was one of the most prosperous years they have ever had, due largely, I take it, to the fact that, owing partly to the inflation of the currency by means of the printing press, they had more money to handle than in normal years."

I think my correspondent may not have given full weight to ruling rates of interest in his review of banking prosperity. It is certainly in the interest of the banks, in one sense, that there should be an ample supply of paper currency and of stocks and securities which bear interest, with limited obligations in regard to gold cover. But, apart from the fact that most bankers will take a broader view, there is a limit to the representation of wealth in such a form, because inflated currency means high prices, and high prices mean in turn less

*Part of a speech delivered at the annual meeting of the Central Mining & Investment Corporation, in London, on June 27, 1918.

safety for advances upon securities and materials. Copper, for instance, at a market value of £50 per ton is better security than copper at £100 per ton. The financial stability of the world is undoubtedly best protected by the backing of as much gold as possible against paper securities and emergencies. It is not necessary, however, for me to pursue this branch of the subject for the purpose of showing—as I think I shall be able to—that gold during the war period at least, has been of greater value than the consideration paid for it. I want to get a clear field to start with. Do not let us mix up the purely domestic question of cost of working, or whether certain low-grade mines should be subsidized or closed down. Those are matters for the exclusive consideration of the people of gold-producing countries. If gold was of such a value that it paid to buy it for more than the normal price, I could understand a special bonus per ounce being given to the Government concerned for distribution among those working material not sufficiently productive to cover the entire working cost. Or a Government faced with this problem might deem it in the interest of the State to subsidize needy mines for the purpose of giving employment to the people. Such considerations are purely of local concern.

The value of our gold in the world's markets is another matter and takes no cognisance of the yield or cost of working the mines. The subject is complexing and delicate. I desire to deal with it fairly and in no partial spirit. When war broke out an agreement was made with the Bank of England to purchase the output in South Africa at the standard rate, subject to certain charges. At the time the terms appeared, as I am sure they were intended to be, entirely fair to the producers. In the early days of the War the immense purchases of material from abroad and the diminishing export trade manifested themselves in adverse exchange-rates, and as the effect was brought to my notice by a representative of some of the gold-producing companies, I directed the attention of the Government to the matter. This was at the end of August 1915. I did not pursue the subject then for a variety of reasons, which it could serve no useful purpose to enter into now. Very shortly after that the Bank of England, at the instance of the British government, made certain modifications in the first agreement which involved higher charges to the mines, but stated "it was not desired to make profit or loss on realization." Without laying too much stress on the matter, I feel bound to note that the producers were not given much opportunity of expressing their views upon the subject. A definite offer was made which left no opening for negotiation. I confess, however, that no one could then foresee either the duration of the War or its effects upon the finances of the world. Everyone knows, moreover, and gratefully acknowledges, that but for the British Navy the gold-mining industry would have come to a standstill. Since the agreement was made, we have steadily watched the increasing losses to which the gold-mining industry has been subjected from a variety of causes, but we contend mainly on account of the adverse exchanges. In recent times I have again taken this matter up, and I believe it is now receiving serious consideration, as a result of which I trust that an expert inquiry may be instituted, so that the equities of the case may receive the consideration to which they are entitled.

With the solitary exception of gold, all commodities have risen, at least in the ratio of their increased cost of production. Fine gold (if we exclude the small amount now permitted to be used for trade purposes, which has risen to something like 115s. per oz.) has remained stationary at the standard price of 85s. per fine ounce. That the raw gold from South Africa is worth more than the price paid for it in paper currency is not a difficult matter to demonstrate in general terms. It is extremely difficult to assemble the data required to prove the amount of the increased value. That is the problem that awaits solution. If we assessed its value according to the rates of exchange it must be admitted that the Exchequer made a very profitable bargain. But the rates of exchange are not the true measure of its value, because it was used partly to regulate those rates, and without our gold the adverse exchanges would have been still higher. We must, however, not lose sight of the fact that our gold can only be disposed of in markets able to consume it on the one hand and give commodities or credits for it on the other. We could not, therefore, if we had had a free market during the War, have hoped always to ship our gold to the particular country among our Allies or Neutrals that at any moment needed it most. Surely here is a case for investigation and, if my contention be upheld, adjustment. Just as we may acknowledge without reservation that the bargain was made in the utmost good faith, so we may reasonably expect, being of opinion the British government has made a large direct or indirect profit out of the transaction, that they will cause an inquiry. Of one thing we may rest assured. The nation would not desire to profit at the expense of producers of any commodity in any part of the Empire. To support my view in broad terms only a simple illustration is required: if we could have paid for our commodities in our own gold, instead of depreciated paper, we should have obtained due compensation in value for part of the increase in our working costs. Theoretically, we could have distributed the commodities bought with our gold at its par value among our workmen (who would not then have needed higher wages to the same extent) and among our shareholders, who would have had higher dividends. Impoverishment or enrichment of the ore treated, taxation, supply and demand, allowances to men serving, etc., would, of course, have influenced the profits, but those factors do not affect the question under review.

Gold held in reserve earns no interest, and therefore is a charge, but it is like all other stock-in-trade, of which hundreds of millions must always be inert in every country, and it is the easiest form in which real wealth may be stored as security for negotiable paper. It is, in fact, an easy form of compressing into very limited

compass the actual representation of a given amount of accumulated material and fruits of industry. My distinguished friend, Mr. Hennen Jennings, in his admirable paper 'The Gold Industry and the Gold Standard,' considers gold coins as "storage-cells of human energy." Stock-taking in such a commodity offers no difficulty. When peace is restored and trade once more flows into its natural channels, it may be assumed that gradually rates of exchange will approximate to pre-war normal conditions, but there will be an intervening period, and perhaps a long one, before that happy stage can be reached. Meanwhile, the restoration of our position in this country would appear to require as much gold as we can possibly attract to our Mint. As far as gold producers are concerned they would, of course, have to take their chance if there is to be a free market for gold, and they might find themselves not unhappily placed under such conditions, but, if the control now reigning is to continue, especially in peace times, then the situation calls for authoritative review and a settlement, the fairness of which is unimpeachable. If the Government holds the view expressed in 'The Times' money article of the 10th instant: "It would, of course, not be possible to allow the mines to realize their gold in whatever market they pleased. That would mean that this country would lose control of the output, which it could not afford to do," it is imperative to discover not only how far it would be equitable to make good any losses suffered by the producers of gold during the War, but to think out a basis which would satisfy oversea producers and their governments in the disposal of their output, either for a given number of years or indefinitely in the London market. While it may be admitted, on the one hand, that no country can afford, except in a case of momentary emergency, to pay more than £1 in value for £1 in gold, the consideration given must be worth £1, and that has not been the case during the War, which is the chief reason for the cost of getting gold being higher than it was in pre-war days. Given full value is paid for the product, then I cannot imagine any system which would justify the subsidizing of gold mines whose yield does not exceed the cost of extraction. The stress in some countries might be so great after the War that they would actually be ready, in order to secure a certain amount of gold to enable them to revive external trade, to forfeit a certain amount of material and labor for this purpose, which is the real effect of a bounty. Such a course of action could not be regarded as sound, and would only be resorted to for the attaining of some specific and probably temporary object.

POTASH is recovered from alunite by crushing it, mixing with crushed coal, and roasting in a revolving furnace. This eliminates part of the contained sulphur by reducing the SO_4 and causing it to be evolved as SO_2. The residuum then consists of $K_2SO_4 + Al_2O_3$. The potassium sulphate is leached with water, leaving the insoluble alumina. The dissolved potash salt is recovered by evaporation of the liquor.

Engineer Officers' Training-School at Camp Humphries

The War Department authorizes the following statement from the Engineering Corps:

The Chief of Engineers, General William M. Black, announced today that the Engineer Officers' training-camp, scheduled to open about August 1, will be situated at Camp Humphreys, 17 miles south of Washington, on a plateau overlooking the Potomac river. Two thousand candidates for commissions as captains and first lieutenants will be trained under the same facilities provided for the 17,000 engineer replacement troops now there preparing for over-seas service. These facilities include the ordinary military arrangements, and in addition some 15 special schools to instruct men on such operations as mining, quarrying, gas and flame-defense, barbed-wire fortification, water-supply, and railroad communication.

The candidates for commission will become familiar with the work of all these schools and conclude their training with a course in sapper-work, in order that they may be fitted to command sapper-troops if necessary. Many of the candidates will come from civil life, a campaign being under way to interest men of technical training and experience.

Many applications for entrance to the training-camp have been received. To examine these candidates, General Black has designated a traveling board, which will visit several of the larger cities and determine the physical and mental fitness of the applicants. This board will be headed by Major E. H. Williams, who will advise the candidates as to the dates on which they should appear in the cities to be visited for examination. Candidates for first lieutenantcies should be between 32 and 36 years old, and those for captaincies between 36 and 42. Traveling expenses to the camp will be allowed successful candidates. Those accepted before August 1 will be sent to the existing Engineer Officers' training-camp at Camp Lee, Petersburg, Virginia.

VANADIUM and arsenic were found in the subterranean waters of Bella Villa, Córdoba, Argentine, in sections of the city where the inhabitants obtain their water from wells. Water from three wells was examined by A. A. Bado; 50 litres being evaporated in each case. Wells No. 1, 2, and 3, respectively, contained 0.3, 1.12, and 0.32 parts per million of As; well No. 2 showed 4.8 parts per million of V_2O_5; well No. 1 a trace of iodine. Two samples of water from the river Tercero, flowing through the city, contained 0.04 and 0.01 parts per million of arsenic as As; tests for vanadium were negative. Bado considers the arsenic to be combined as sodium arsenate and the vanadium as sodium vanadate or meta-vanadate. Arsenic was determined by twice evaporating the residue from 25.1 of water to dryness with HNO_3, removing the SiO_2 and evaporating the filtrate with H_2SO_4 until appearance of SO_3 fume, and then using the Marsh apparatus.

CASTING SWING UPON DERRICK FOR WELDING

Oxy-Acetylene Welding of a Roll-Frame

By O. J. ZOOK

PRE-HEATED CASTING BEING WELDED

The use of oxy-acetylene welding for the repair of broken mining machinery is coming into more general use, many interesting and difficult jobs being undertaken. The Butte & Superior Mining Co. recently completed a welding job notable for its size, being one of the largest ever undertaken in the United States.

During the summer of 1916 the frame of one of the

WELDER AT WORK

54 by 20-in. Garfield rolls was broken between the sliding and stationary bearings, the break extending from the outer side of the frame to the inner side. The break was caused by the carelessness of an employee in letting an 8-lb. hammer pass through the rolls, which had new oversize shells, thus leaving little clearance between shell and frame, so that the hammer forced the movable roll back against the end of the frame, causing the break.

At that time a repair was effected by chipping notches

in each end of the frame, and shrinking on a 3-in. square bar with reinforced hooks at either end. This answered the purpose satisfactorily for a time, but the continuous vibration finally caused it to work loose. It was then decided to weld the break, at the same time renewing the inner side of the frame where the ore had worn through the casting. Measurements were taken, and patches for each side of the hopper were cast. These patches measured 4 ft. 4 in. by 3 ft. 6¾ in. The worn parts were then chipped out, the patches being fitted and clamped into place. The roll-frame was moved outside the building. A wooden derrick with several I-beams across the top was erected, and then equipped with crawls and chain-blocks. This was necessary in order to turn the casting over, enabling the welder to reach the reinforcing ribs underneath.

The casting was raised six inches above the ground and set on fire-brick. A dry wall of fire-brick was built around it to act as a furnace for heating. A charcoal fire was built in and around the casting, it being evenly heated to prevent warping during the welding operation. After the casting became a dull red the welding was started, the break being welded first, then the ribs on the outer side of the patches. After completing this, the casting was set on edge, as can be seen in the accompanying illustrations, the welds being made along the ends of the patch on the lower side and the reinforcing ribs underneath. After this was completed the casting was turned over and the opposite patch welded. The heat produced by the oxy-acetylene torch for welding is 6000° Fahrenheit.

The size of the job can be realized when it is noted that the casting along the cracks is from 1¼ to 3 in. thick, the total length of welds being 28 ft. The casting weighed 40,000 lb. It required 84 hours to chip the casting and fit the patches, and 72 hours for heating and welding. The work was done under my personal supervision. The rolls have been in operation again for the past three weeks and no flaws have developed. Apparently the frame is as good as new.

The company has its own acetylene-generating plant, and is well equipped to do this class of work.

Concentrating a Tin-Wolfram-Lead Ore

*The Butler tin mine is situated seven miles from Torrington, New South Wales, in fairly rough granite country. The lode is worked by an adit-level 920 ft. long, and also by a main shaft; the deepest point in the workings is 315 ft. from the surface. Ore has been opened above No. 1 and 2 levels, and at No. 3 intermediate level, at a depth of 300 ft. A considerable amount of development had been done before the present company took over the mine and started to erect the plant for treatment of the tin ore.

When milling started in July 1916, it was found that the lead in the ore made the concentrate unsaleable. The average assay of the concentrate was 53% Sn, 12% WO_3, and 5% Pb. In order to overcome the trouble it was decided to erect a Minerals Separation flotation unit for recovery of the lead, and a magnetic separator to take out the wolfram.

The primary treatment section includes ten 1250-lb. stamps. The crushed ore, after passing through an automatic sampler, goes to a three-compartment classifier. The first compartment feeds No. 1 and 2 Wilfley tables, the second, No. 3, and the third, No. 4. The overflow from the classifier goes to two Callow tanks, from which the thickened product is fed to No. 5, 6, and 7 Wilfleys. The overflow goes to the settling-box, thence to the vanners. The headings from No. 1 and 2 tables go to hydraulic cleaners, and the headings from No. 3 and 4 to a settling-box. The seconds from No. 1 and 2, also from No. 3 and 4, are re-treated on No. 5 and 8 Wilfleys. The headings from No. 5, 6, 7, and 8 tables go to a settler on a buddle, the seconds to vanner, and the tailing to the flume.

The tailing from the flume passes into a V-box with a 1½-in. opening three inches from the bottom for the escape of coarse sand, while the overflow is distributed over bag-strakes. The fine material from the strakes is further dressed on a Triumph vanner. Below the strakes the overflow joins the coarse sand discharged from the V-box, before passing through the tailing-sampler and into the three-compartment dewatering-box, thence to a slime-settling tank. The overflow from this is returned by pump to the battery-feed tank.

The recovery given by the wet-concentration plant—Wilfley tables, Frue and Triumph vanners—is 80.0% Sn, 67.7% WO_3, and 66.0% Pb. Owing to the large amount of slime, the result is considered excellent.

Secondary treatment: After being dressed the tin-wolfram-lead concentrate is sent to an M. S. flotation unit. The leady concentrate is floated off into settling-boxes for subsequent re-treatment, while the tin-wolfram residue is dried and treated by magnetic separator. A Berdan pan is used for re-grinding any portion of the leady concentrate considered too coarse for flotation. The flotation unit gives a recovery of 98% of the lead. The magnetic separator, which is of the 'motor' type, gives a marketable product when working on a fairly coarse tin-wolfram concentrate; but is not comparable with the Wetherill type in dealing with the fine, owing the amount of re-treatment required. C. L. Smith is manager of this interesting property.

*Abstract from 'Chem. Eng. & Min. Rev.,' Melbourne, Australia, June 5.

BRACKEN is considered a likely source of potash. The ash of bracken contains 40 to 50% of soluble K_2O. The weed grows abundantly on some Australian soils, yielding as much as 400 lb. of ash per acre. The ash is bulky and gray in color, distinctly alkaline, and slightly caustic. The alkalinity is due to carbonates and to some extent to free CaO and MgO. The potassium is combined principally as sulphate and chloride, and to a less extent as the carbonate.

CRIPPLE CREEK, COLORADO

Dividends for Half-Year.—Rich Ore From Leases.

Dividends distributed during the first half of 1918 totaled $1,487,000. The so-called close corporations and leasing, sampling, and milling companies are not included in this.

A rich shipment was made last week from the American Eagles mine, on the summit of Bull hill, when between 35 and 40 tons of 40-oz. gold ore was sent under guard from the Basket and Luce lease on the 15th level. This lease was tied-up by litigation for more than four years. The royalty under the agreement permitting these lessees to resume operations will be paid in to the first National Bank of Colorado Springs, to be held in escrow, pending settlement of the litigation between Stratton's Cripple Creek Gold Mining & Development Co.—the Stratton estate—and the Findley Mines Co., involving apex rights.

The Excelsior M. L. & E. Co. having made connection with the Golden Cycle mine workings from the 500-ft. level of its main Llewellyn shaft, is dispatching a car of ore daily. It will assay from $25 to $50 per ton.

ST. LOUIS, MISSOURI

Proceedings of the American Zinc Institute.

The American Zinc Institute met at the Stadtler hotel, St. Louis, on July 29 and 30. The address of welcome was by the president of the St. Louis Chamber of Commerce. F. C. Wallower, manager of the Golden Rod Mining Co. at Joplin replied. The chairman, Victor Rakowsky, outlined plans and the purpose of the meeting. An address, 'Benefits to be derived from close co-operation of zinc smelting and mining interests in helping win the War', was given by W. R. Ingalls. C. E. Siebenthal, of the U. S. Geological Survey, spoke on the 'World's Zinc Resources and Their Political Control.'

On the second day an address on 'New Uses of Zinc' was given by A. P. Cobb, vice-president of the New Jersey Zinc Co. 'The Value of Experimental Work in Developing New Uses of Zinc and Zinc Products,' was discussed by John Johnson of the Research Council of National Defense at Washington. J. L. Bruce, of the Butte & Superior Mining Co., covered 'Zinc Mining and Production in Western States.' Other addresses were: 'Zinc Mining and Production in South-Eastern States,' by J. N. Houser, vice-president of the American Zinc, Lead & Smelting Co.; 'Sheet Zinc Industry in United States and Benefits of Co-operation Between Mining and Smelting Interests,' by E. H. Wolfe, president of the Illinois Zinc Co., Peoria, Illinois; 'Zinc Mining and Production in Missouri-Kansas-Oklahoma and Arkansas,' by Otto Ruhl of Joplin; 'Zinc Mining and Production in Wisconsin,' by W. N. Smith, manager of the Vinegar Hill Zinc Company.

There were 200 men at the meeting, representing every branch of the zinc industry in the United States. Nearly every smelting company sent a representative. The Joplin district (Missouri, Oklahoma, and Kansas), Wisconsin, and Colorado districts had a large number attending. The keynote of the meeting was closer co-operation between all branches of the industry in order to ameliorate prevailing conditions. The organization committee elected, who will draft the final plans to be adopted, are W. R. Ingalls, A. P. Cobb, and Edward Mosbaugh of New York; J. N. Houser, Willam Lanyon, and A. B. McMillan of St. Louis; W. B. Shackleford, P. B. Butler, C. T. Orr, and W. H. Eardley of Joplin; J. R. Cole of Tulsa, Oklahoma; J. C. Haywood of Yellville, Arkansas; D. D. Dunkin of Webb City, Missouri; Fred H. Hale Jr. of Goodsprings, Nevada; G. L. Coleman of Miami, Oklahoma; J. H. Billingsley of Galena, Illinois; J. L. Bruce of Butte, Montana; Julius Hegeler of Danville, Illinois; G. E. Nicholson of Kusa, Oklahoma; O. S. Picher of Chicago; and E. H. Wolfe of Peru, Illinois.

MAP OF THE UNITED STATES SHOWING LOCATION OF IMPORTANT ZINC-PRODUCING DISTRICTS, ZINC SMELTERS, ZINC-OXIDE PLANTS, AND ELECTROLYTIC-ZINC PLANTS. After U. S. G. S.

TORONTO, ONTARIO

Cobalt, Porcupine, and Fort Matachewan Notes.

Dividends declared by Cobalt companies during the first six months of 1918 amounted to $2,368,527, compared with $3,115,379 during the corresponding period of last year, a decrease of 24%. Only eight companies have declared dividends this year, against thirteen in the first half of 1917.

La Rose Consolidated has decided to discontinue dividends and conserve its cash for carrying on development in the Violet property, where a new vein has been cut on the 400-ft. level. A high-grade vein, 4 to 6 in. wide, has also been found on the 70-ft. level of La Rose.

At the Gifford a cobalt-calcite vein has been cut on the 350-ft. level.

The Peterson Lake mill has been started, and will treat tailing from the Seneca dump, by re-grinding and flotation.

Porcupine.—The Dome Mines company has let a contract for driving a long cross-cut on the 1200-ft. level toward the Dome Extension boundary to determine the value of an extensive orebody indicated at that depth by diamond-drilling.

Operations on the Vipond-North Thompson have been suspended; but the exploration of the Thompson-Krist property adjoining through the Vipond N. T. workings is being carried on with satisfactory results.

The McIntyre is preparing to develop the Newray at considerable depth, on which it holds a two-year option, as the best results there have been between 700 and 1000 ft. A system of selective mining will be adopted.

Fort Matachewan.—The option held by the Mining Corporation of Canada on the Davidson claims has expired, and negotiations for its purchase have been broken off.

SUTTER CREEK, CALIFORNIA

Progress at the Old Eureka.—Lincoln, Keystone, and Bunker Hill Mines.

The shaft at the Old Eureka mine has reached a depth of 2400 ft., which is 240 ft. below the lowest point reached by the former owners. The contract held by the present shaftmen will carry the work 60 ft. farther, and when the shaft has attained a depth of 2460 ft., new contracts will be let. The old mine has been opened by a three-compartment shaft from surface to 1600 ft., incline depth, and the new owners' first work after unwatering the mine was the enlarging of the shaft from 1600 to 2160 ft., so that the main skips could be used from the surface to the bottom. This was a long and tedious job, and shortage of labor, difficulty in securing machinery, and other abnormal conditions served to delay progress, but good headway is now being made. The company is to sink to 3160 ft. before doing much exploration on the orebodies exposed in the old workings, or following the veins cut in sinking. The shaft has passed through some good-looking rock within the past few weeks, and there is said to be a large shoot of pay-ore practically blocked out between the 1200 and 1600-ft. levels. Improved methods of milling since former operation of the Old Eureka should yield a good profit from ore considered waste by those who allowed the mine to fill with water 30 years ago; the concentrate was not saved at all, and amalgamation was crude. The new owners have ample funds to properly equip the mine, and so far all installed is modern. A ranch to the east of the shaft, added by the new company to the original holdings, is well situated for use as a mill-site, while other ground has been purchased for use as a tailing impounding area.

D. V. Ramazzotti, who is connected with the Knight company's foundry here, has purchased the old machinery belonging to the Lincoln Mining Co., in the mills and around the hoisting plants of the Wildman, Mahoney, and Lincoln mines, and has men removing everything of value. These plants have been idle for a number of years, and the workings will be equipped with up-to-date machinery when the new owners are ready to re-open the combined properties. In the meantime, the iron and steel salvaged in dismantling the old works will help relieve current needs. The Wildman portion of the Lincoln company's holdings underlies Sutter Creek and adjoins the Old Eureka property. As many of the same people are interested financially in the two mines, there is a probability that a combination may later be affected. An immense body of low-grade ore was developed on the 1400-ft. level of the Wildman shaft just before financial difficulties compelled the former owners to suspend operations, and both the Lincoln and Mahoney mines not only yielded well in early days but contain ore that can be profitably handled by modern methods.

The Keystone Mines Co. made a profit of $1500 in June, which is encouraging. Considerable development is in progress in addition to the mining of low-grade ore, but costs have been reduced to a minimum, and prospects are fair for opening better ore at an early date. Forty stamps are dropping steadily. Carlton R. Downs of Sutter Creek is manager of this property, which has been in continuous operation since the time of its discovery in the early 'fifties.

Twenty stamps are crushing ore on day shift at the Bunker Hill mine, north of Amador City. Shortage of labor for development has seriously hampered operations for months past. A 10c. assessment has been levied for additional exploration and the possible sinking of the shaft to another level. C. E. Bunker is superintendent.

VICTOR, COLORADO

Program of the A. I. M. E. Meeting in Colorado.

The American Institute of Mining Engineers will meet at Denver and Colorado Springs from September 2 to 7.

The meeting opens at the Brown Palace hotel at Denver on the first day. There will be a technical session in the morning, followed by a visit to the ferro-manganese plant, and a trip to Look-Out mountain. Next day, at noon, members meet at the Broadmoore hotel at Colorado Springs. Besides a technical session, trips will be made to the Golden Cycle mill at Colorado City, and the Portland, Cresson, and Independence mines at Cripple Creek, also the Portland mill and a trip around the district. At Pueblo will be visited the plant of the Colorado Fuel & Iron Co., the smelter of the American Smelting & Refining Co., and the zinc plant of the same company. A run will be made to the top of Pikes Peak. Ladies will be suitably entertained and the closing banquet will be held Friday night. Spencer Penrose is chairman of the local committee, A. E. Carlton, chairman of the finance committee, and Charles McNeill, president of the State section.

VICTORIA, BRITISH COLUMBIA

Smelting Charges and Bounty on Zinc.

The mine operators of the Kootenay district are petitioning the Dominion government to appoint a royal commission to investigate the reduction charges of the Consolidated Mining & Smelting Co. at Trail. It is represented that the committee of the Associated Boards of Trade of British Columbia, which was authorized by the Dominion authorities to proceed with the inquiry and granted $3000 toward its expenses, has not large enough powers to enable it to make its work thorough. It is maintained that $10,000 at least is needed, and that there should be power vested by the Government in the Committee to enable it to take sworn testimony. Meanwhile, O. R. Whitaker, of Colorado, who this year prepared a report of similar character in Colorado, has been retained by the Dominion government to assist

ALASKA

Treadwell.—Ore is being hoisted from a depth of 2800 ft. in the Ready Bullion mine of the Alaska United. This is the deepest mining in the Territory.

ARIZONA

Jerome.—There is nothing new in the labor situation here. It is evident that the decision of the Federal mediater, Hywell Davies, will be accepted when announced.

A new bonus-system has been announced by George Kingdon, general manager of the U. V. X. Employees remaining continuously in the service of the company for one year will receive $100 bonus at the end of such year's service, and $10 for each additional year's service until a total of $250 is reached, after which the latter amount will obtain as long as such service remains continuous. The rule takes effect July 1, 1918, and the first year's bonus will be paid August 1, 1919. Thirty days lay-off with permission will be allowed each year. However, in cases of sickness or accident, such lost time will not be deducted from the time alloted for lay-off.

The Green Monster company has suspended work in its Gorge tunnel to concentrate operations in sinking the Dorothy May shaft, which is now in schist at 765 feet.

The Gadsden shaft is down 1142 ft. in quartz-porphyry, quartz, jasper, and schist. Some of the formation is mineralized.

United Verde Copper paid $1.50 per share on July 18. This makes $18.50 for the current year, $1 more than the whole of 1917.

Phoenix.—The State Tax Commission's valuation of mining companies for the year totals $421,936,854, a gain of $82,716,226. All of the large properties are assessed at a higher rate.

CALIFORNIA

Bishop.—Little has been heard of the Consolidated Wilshire Mining Co., operating near here, but on July 23 it was reported that ore had been found at a depth of 76 ft. An assessment of 1c. per share is due on August 19. Part of this is to be used in enlarging the mill.

Cima.—There is said to be a good deal of interest in tungsten possibilities near this place in San Bernardino county. The Peru Mining Co. holds 7 claims, on which sampling shows ore to carry 3.6 to 5.5% tungstic oxide.

Kennett.—The Shasta National Copper Co. has made a final payment of $40,000 on a large group of copper claims west of the Mammoth. Extensive diamond-drilling will be undertaken at once, it is announced. The company is composed largely of Pittsburgh capitalists.

Redding.—The hull of the dredge being built across the river by the American Gold Dredging Co. was floated on July 20. It will be a month or six weeks before machinery will be in place and the dredge ready for operation.

Peardmont.—Frank F. Peard, vice-president of the United Tungsten-Copper Mines, is to supervise the building of the company's first 25-ton mill at its tungsten mine in San Bernardino county. The company owns 300 acres in the Morongo district that has been developed during the past 18 months. Ore-reserves warrant the new mill. A recent shipment of 600 lb. of scheelite from sluice-boxes was very satisfactory. The U. S. Government assayer at Salt Lake City returned 69.7% on concentrate and 77.9% in the scheelite crystals. Ricketts & Co. of New York gave 71.24% on the concentrate, and Smith, Emery & Co. of Los Angeles gave 71.47% for the 600 pounds.

COLORADO

According to Charles W. Henderson, of the U. S. Geological Survey, the production for the six months of 1918 shows a considerable decrease in gold and an appreciable decrease in silver. Copper has never been an important mineral in Colorado, and in 1918 so far it shows an appreciable decrease as compared with 1916 and 1917. The output of lead has remained practically stationary during 1918. The market for the low-grade zinc ores of Colorado is not encouraging, and the production has already fallen off considerably. There are no really high-grade zinc ores in Colorado comparable to those of the Miami, Oklahoma, field. Gold production from Cripple Creek for the first six months of 1918, compared with the same period in 1917, shows a decrease of $800,000; which, if continued, means for the year a decrease of $1,600,000 to $2,000,000. [A Denver paper states that the decline at Cripple Creek for the first half of 1918 is only $58,317.—Editor.] Leadville already shows a decrease in the output of gold, silver, copper, and zinc, but an appreciable increase in the output of lead. The output of manganese-iron ores from Leadville for use at steel plants has been steady. The re-opening of the Ute and Ulay mines at Lake City, Hinsdale county, and the development work at Creede promise to add to the lead output of Colorado. San Juan county has not quite maintained the output it made in 1917, but the San Miguel county (Telluride) mills have produced at a greater rate. Decreased supplies of ore have caused the closing of the sampling-works at Black Hawk, Gilpin county, and at Georgetown, Clear Creek county, both old establishments. The sampling-works at Idaho Springs has continued its operations. The number of active mines in Boulder county has become small. The dredges in Summit county have so far not yielded their usual output, but production during the first three months of the year is generally low at Breckenridge; the dredging begins to be good in June. The sampling-works at Breckenridge has been closed. The Derry Ranch dredge, near Malta, Lake county, resumed operations in May. Mines at Bonanza, Saguache county, have continued operation with promise of a considerably increased production when the tramway from Bonanza to the mill now building at Shirley is complete.

Aspen.—The organizing and taking over of many claims and fractions virtually gives the Park Tunnel, Mining & Milling Co. control of the Tourtellet Park mining section of Aspen mountain. This company is composed mainly of experienced Aspen and Leadville men. The adit to open the orebodies has been started on the Tubal Cain at the head of Keno gulch, and will be driven 3000 ft. south-east to a point directly beneath the workings of the Last Dollar, at a depth of 800 ft. From the mouth of the adit a tramway will be built to connect with the railway near the New-

man tunnel. Robert Shaw and Frank M. Yates of Aspen are president and secretary, respectively.

Boulder.—The increased freight rates, smelter charges, taxes, wages, and cost of supplies is felt heavily here, especially by lessees. Ore carried by the Denver, Boulder & Western line previously had the following rates:

Value per ton	Rate per ton
Under $20	$1.80
$20 to $30	3.75
$30 " $40	4.50
$50 " $100	5.75
$100 and over	7.00

The recent 25% increase over all old rates ordered by the Government increased the schedule to:

Value per ton	Rate per ton
Under $20	$2.25
$20 to $30	4.70
$30 " $40	5.60
$50 " $100	7.20
$100 and over	8.80

Freight rates on the D. B. & W. may be lowered.

Smelting charges jumped from the old rate of $4.50 to $6, and recently to $6.50 per ton.

Denver.—At Utah Junction, near here, ferro-chrome is being made from chrome mines in California and Oregon, according to a Denver paper.

Eldora.—The old Springdale silver district is being reworked, ore now being shipped.

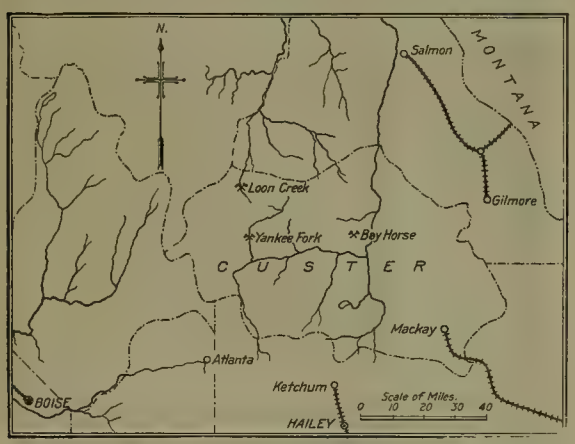
Leadville.—A contract has been let to extend the Anderson tunnel 750 ft. in Prospect mountain. This will make a total length of 2300 ft. C. H. Weaver is manager.

In the Matchless mine on Fryer hill an iron-silver vein, assaying 5 to 10 oz. per ton, has been opened at a depth of 92 feet.

Lessees at the Gray Eagle on Carbonate hill have found a new deposit of manganese on the 600-ft. level.

IDAHO

Ore deposits in the north-western part of Custer county are described by J. B. Umpleby in Bulletin 539 of the U. S. Geological Survey. The area studied, comprising the



PART OF IDAHO, SHOWING DISTRICTS IN CUSTER COUNTY DESCRIBED IN REPORT

Loon Creek, Yankee Fork, and Bay Horse districts, includes several promising deposits and a few mines where a considerable tonnage has been blocked out for a number of years, awaiting more advantageous transportation facilities. It is believed, however, that with high prices for metals much of this ore might be mined at a good profit. The deposits include gold placers and lodes carrying gold-silver, gold-copper, and lead-silver ores. In most of the deposits the ore is of excellent grade. North-western Custer county is certain to produce large amounts of silver, lead, copper, and gold in the future, if only from deposits now developed. The deposits of the Bay Horse district are by no means exhausted, and in some a considerable tonnage is actually blocked out. Many others are inadequately developed, and much of the intermediate territory is comparatively unprospected. In the Yankee Fork district little ore has been opened, and any considerable future production from the shoots now recognized is problematical, but in a heavily-timbered area where such bonanza deposits have been found there is ever the probability of new discoveries. One noteworthy discovery is known to have been made since the report was written. The Loon Creek district contains gold placers that will probably be worked in the near future. In addition to these there are gold-copper veins, one of which has been explored to a depth of 1000 ft., and throughout this vein the ore has ranged in value from $25 to $90 per ton with no evidence of impoverishment with depth. The area of dolomitic limestone near the head of Deer Creek is also thought to be a promising field in which to prospect for lead-silver deposits. It is highly probable that in a rough country like north-western Custer county new deposits will be found when mining again becomes active. Under normal metal prices such activity could scarcely be expected to precede the advent of a railroad, for the larger properties are held by companies which for many years have shown no inclination to rob the known deposits. At present, however, there is believed to be abundant justification for prospecting and reasonable exploitation.

Adair.—The Richmond M. M. & R. Co., according to its president, J. E. Codd, has cut 10 to 14 ft. of 20.3% copper ore on the 150-ft. level. The shoot has been followed for 100 ft., the width being from 4 to 8 ft. carrying 5 to 6% copper, excepting for the new section. Fifteen carloads of ore have been shipped since June 15.

Burke.—The Hecla company is mining 1200 tons daily. Of this, 750 tons goes to the mill at Gem, 200 tons to the Federal mill at Wallace, 50 tons to the smelter, and the remainder is waste. A station is being cut on the 2000-ft. level. Labor is 20% short.

Kellogg.—On July 17 the Caledonia company paid its regular monthly dividend of 3c. per share, equal to $78,150.

At the Bunker Hill & Sullivan smelter two furnaces are in blast. More men are wanted at the mines.

Mullan.—The Interstate-Callahan expected to resume milling early in August. The plant has been closed since June 1 for improvements, which are considered will give a 15% higher recovery.

MICHIGAN

Houghton.—On August 15 the Champion company pays $6.40 per share, making $12.80 for the current year.

Following an air-blast in the Quincy mine last week, a fire started, but was quickly put out. Fire also started in No. 3 and 4 shafts of the Ahmeek. These were sealed in order to smother the outbreak.

St. Mary's Mineral Land Co. pays $2 per share on August 15. This is the second of like amount this year.

Copper output of the Mohawk in June was 783,771 lb., against 1,042,182 lb. a year ago. Wolverine produced 336,455 lb., a drop of 119,731 lb. compared with June of 1917.

Calumet & Hecla reports as follows for June and the year to date:

Mine	June, lb.	6 months, lb.
Ahmeek	2,301,867	13,976,220
Allouez	619,217	3,972,854
Calumet & Hecla	5,076,774	36,092,278
Centennial	236,100	1,332,885
Isle Royale	1,461,165	7,325,096
La Salle	138,249	1,013,644
Osceola	1,505,758	8,300,655
Superior	164,332	996,531
White Pine	205,750	1,372,690

MISSOURI

Joplin.—Production of the region last week was 6795 tons of blende, 720 tons of calamine, and 1194 tons of lead. These averaged $52, $35, and $100 per ton, respectively. The total value was $531,918, of which Missiouri contributed $119,068.

The Connecticut Zinc Corporation, at Joplin, known here as the Oronogo Circle Co., is building the largest concentration plant in the district near Oronogo. F. L. Wilkins is general superintendent.

Seneca.—The Oklamo Mining Co., which is drilling on the Seneca fault in Ottawa county, Oklahoma, near Joplin, has cut rich lead ore at a depth of 35 to 50 ft. The hole will be continued to 300 ft., the deepest in the field. A 200-ton mill is proposed.

MONTANA

Butte.—Anaconda is shipping 700 tons of manganese daily. The status of the Butte, Anaconda & Pacific Railroad is not decided. It may remain in control of its owner, the Anaconda company, and not pass to the Government. Most of its business is carrying ore, etc., for the company.

The Butte-Ramsdell company, leasing the Lizzie claim from Davis-Daly, is mining some good ore from an 8-ft. vein.

A Federal employment office was opened at Butte last week. A large crowd registered. Labor agitators are said to fear that the regulations may be more strict than those of the Anaconda company.

Labor is restless here, in spite of the recent 50c. raise in wages. The Metal Mine Workers' Union on July 26 posted a notice saying: "The Metal Mine Workers' Union wishes to warn the membership against the misleading inference that a strike is to be called for tomorrow noon. Stay at your work until we find that there is no other course left to settle our grievances. Hold your places until a general call is issued." On July 26, C. F. Kelley, vice-president of the Anaconda company, stated publicly at Butte that the I. W. W. would never be consulted regarding the labor situation. Organized labor would be treated squarely. The latest demands are unreasonable.

Great Falls.—Anaconda's new copper rod and wire mill here is working well, and has plenty of orders to keep it busy. The first shipment of rods went to Montreal, Canada. The order is for 250 tons.

NEVADA

Ely.—Machinists on the Northern Nevada railroad—Ely to Cobre—struck for $7.22 per 8-hour shift on July 15. The line is tied-up; no ore is moving from Ely to McGill. This demand has been refused by the manager. Machinists at the mines and works will not join the others.

Goldfield.—The Atlanta company is being re-organized as the Reorganized Atlanta Mines Co. Work is under way on a vein at 1850 feet.

On its 500-ft. level the Red Hill Florence mine is showing the best ore. A carload has been shipped. A winze is being sunk on this shoot.

The Silver Pick shaft is 1200 ft. deep, where lateral work is to be started. G. F. Dyer is manager.

Goodsprings.—Shipments from this district in June were 33 cars of zinc, lead, and copper ore, 2 cars of zinc ore, 1 car of lead ore, and 6 cars of zinc slime.

Pioche.—Prince Consolidated has purchased for $60,000 cash a ½ interest in the Davidson claim, making the company the sole owner. The Prince property now consists of 18 full and contiguous claims. The new shaft is down 450 ft., being sunk from surface, along with stations, etc., by the Walter Fitch, Jr., Inc., in 60 days. M. C. Godbe is general manager.

Tonopah.—At a depth of 1150 ft. the Great Western company, operating in the western area of this district, has opened an orebody 12 ft. wide. The ore is not of commercial grade, but this development proves the ore-zone in the district to be 1500 ft. beyond where it had been worked.

The Extension is sinking to 1850 ft. Water, up to 300 g.p.m., has hindered work somewhat. On the 1500-ft. level are three pumps, and another is to be put in at 1680 feet.

The Tonopah Divide has cut 22 ft. of ore on the 370-ft. level, about equal in value to the level above. Rich ore is showing on the foot-wall.

OKLAHOMA

Picher.—Production of the district last week was 5218 tons of blende and 1013 tons of lead valued at $395,630.

Strand.—The Red Granite Copper & Water Co. has been organized to develop pyrite deposits near here. W. E. Hudson is president. The Graselli Chemical Co. is to buy the ore at $7 per ton. The ore is near the surface. Strand is not far from Joplin, Missouri.

OREGON

The U. S. Geological Survey, through C. G. Yale of the San Francisco office, has issued advance figures of mine production during 1917. The returns were (those for 1916 being in parentheses): producers, 76 (108); ore treated, 142,438 tons (159,071); placer gold, $727,366 ($872,517); gold from deep mines, $764,432 ($1,029,662); silver, 125,656 oz. (231,342); copper 2,474,487 lb. (3,581,886); lead, ... lb. (28,000); and total value, $2,270,874 ($2,937,487). Baker county's gold mines and placers, and copper, accounted for $1,689,601; and Josephine county $370,981.

SOUTH DAKOTA

Production of gold in the Black Hills district for the first six months of 1918 shows a small decrease when compared with that for the same period in 1917, according to Charles W. Henderson, of the U. S. Geological Survey.

UTAH

Cisco.—The Grand River Placer Co. has been organized to enlarge operations on gravel claims 11 miles from this place in Grand county. O. W. Kumrow is president. Present plant capacity is 35 cu. yd. daily, to be increased to 200 yd. Gold content is said to be high. A Mitchell amalgamator is in use, but tables are to be put in to save black sand, magnetic iron, and tin.

Marysvale.—Swift & Co. of Chicago are the latest to enter the alunite field, taking an option on the Bradburn claims. E. G. Briggs is representative for the firm.

The Florence mill will be ready to extract potash by September 1. At present, alunite from this mine is sent to the Chamberlain mill.

The Deer Trail company is shipping two or three cars of lead-silver-gold ore per week to Salt Lake smelters.

The I-X-L is producing rich lead-silver ore.

Watson.—The Ute Oil Co. has issued a well-illustrated prospectus. The capital is $1,000,000, shares $1 par, the company being incorporated in Arizona. C. M. Curry is field manager; I. Grettum, shale-plant superintendent; and G. W. Wallace with W. E. Griffiths, consulting engineers. A report on the shale lands was made by David T. Day of Washington, D. C. Core-drilling to a depth of 300 ft. was suggested. The estimated cost at the crude oil stage was $1.02 per ton of shale. The process of retorting coal and shale was also discussed by Mr. Day. G. W. Wallace, consulting engineer, reports that an hour's distillation of shale yielded 51.5 gal. of crude oil per ton, also 3.6 gal. of gasoline from gases. The cost of producing oil from one ton of shale is given as $1.90 per ton.

WASHINGTON

Advance figures of mine production during 1917 have been issued by the U. S. Geological Survey, compiled by

C. N. Gerry. There were 136 producers, an increase of 23, yielding a total value of $2,289,285, a gain of $240,935 compared with 1916. This does not include coal or magnesite. The 172,119 tons of ore treated gave 23,816 oz. of gold, 282,320 oz. of silver, 2,199,518 lb. of copper, 9,789,687 lb. of lead, and 1,195,567 lb. of zinc. Ferry county (Republic) contributed nearly 70% of the gold. Copper fell off 445,000 lb., this coming from Stevens county (Chewelah). Lead gained 4,400,000 lb., coming from near Northport.

Kiesling.—The Spokane Tin & Tungsten Co. has been organized with a capital of $1,500,000, to develop a property in this district. F. C. Bailey and others of Spokane were the incorporators.

CANADA

British Columbia

Anyox.—Employees of the Granby Consolidated are demanding a raise of $1 per day, of which the company offers 25 cents. Laborers get $4.75 at present, higher than anywhere in the Province. About 2000 men are affected by the strike. Living conditions are comfortable, as the company rents good houses to its employees.

Ontario

Cobalt.—On August 1 the Coniagas paid a 2½% dividend, equal to $100,000. This makes $300,000 for 1918, and $9,040,000 to date.

Gowganda.—This silver district is reported to be generally active. The Miller Lake O'Brien mine is producing regularly; the Walsh mine has an 8-in. vein on the 100-ft. level; the Castle is being sunk to 300 ft.; work is to be started on the Bonsall claims; and negotiations are under way to develop other properties.

Kirkland Lake.—The Wright-Hargreaves mine is now developed sufficiently for a mill, so one of 150-ton capacity is to be erected at once.

Porcupine.—The West Dome Consolidated Co.'s report for 1917 states that 4438 ft. of work was done. The vein averages $8 per ton. Arrangements are being made to have the ore treated. Cash on hand on April 30, 1918, was $38,000.

Barite is now being shipped at the rate of 30 tons daily from the Premier-Langmuir mine, near here. The mill makes a high-grade product, worth $38 per ton. Charles Dalby is manager.

MEXICO

Mexico City.—A U. S. Consular Report dated July 13 states that the press on that day published a circular of the Department of Industry, Commerce, and Labor, permitting foreigners to present denouncement of mining claims without prior presentation of citizenship certificate called for in paragraph 1 of Article 27 of the Constitution, but this certificate must be presented before completion of denouncement proceedings. Claims previously denounced by foreigners will be accepted and foreigners will be allowed until August 31 next to present certificates referred to.

Guerrero

Acapulco.—A U. S. Consular Report, dated April 1, states that mining failed in development last year and the reputed rich mines of the district remained untouched. The development of this industry will wait on railroad and highway construction.

Sonora

Cananea.—Greene-Cananea, since resuming late last year, has had six months of peaceful operations, production steadily increasing. The output to June 30 was 23,780,000 lb. of copper and 626,370 oz. of silver. The company's financial condition is strong.

PERSONAL

Note. The Editor invites members of the profession to send particulars of their work and appointments. This information is interesting to our readers.

A. J. Sale was in San Francisco from Nevada.

Samuel H. Dolbear has returned from New York.

G. L. Sheldon, of Ely, Nevada, is in Beaverhead county, Montana.

Walter G. Perkins has returned from New York to San Francisco.

Falcon Joslin has returned from Washington to Fairbanks, Alaska.

Homer L. Carr was in San Francisco and has gone to Soulsbyville, California.

Milton A. Allen, of the University of Arizona, was here from Tucson for a few days.

Philip N. Moore, accompanied by **W. N. Cummings,** sailed from Seattle on July 23 for Alaska.

Fred B. Ely has received appointment as First Lieutenant in the Aviation Section of the Army.

C. E. Addams has resigned as general manager for the Arizona Hercules Copper Co., at Ray, Arizona.

Harry H. Webb returned from an inspection of the La Grange mine in time to attend the Bohemian jinks.

McClelland Henderson, of Johannesburg, South Africa, passed through San Francisco on his way to Oregon.

E. A. Sperry, professor of metallurgy in the University of Peiyang, at Tientsin, sailed for Shanghai on August 3.

E. A. Julian has succeeded J. W. Hutchinson, now in the Army, as manager of the Goldfield Consolidated Mines Company.

Harry H. Webb Jr., of the U. S. Aviation Service, lost four fingers of his right hand in battle and is now in a French hospital.

W. Spencer Hutchinson, of Boston, is in Peru, making an examination of the properties of the American Vanadium Company.

R. W. Brock, Major, formerly director of the Geological Survey of Canada, has been appointed geological expert in Palestine for the British government.

Richard Hamilton, general manager of the Great Boulder mine, has been re-elected president of the Chamber of Mines of Western Australia for the twentieth time.

Robert Chartran, recently engineer with the Lena Goldfields company in Siberia, has arrived in San Francisco, after a most difficult journey over the trans-Siberian railway.

B. Magnus has been commissioned Captain in the Engineer Reserve Corps, and is now on active duty. He requests that all communications for him be sent care of Henry M. Toch, 320 Fifth avenue, New York.

Austin F. Rogers, associate professor of mineralogy in Stanford University, accompanied by **Charles W. Coyle,** of Oakland, was at Placerville, California, on July 23 making an inquiry into the mineral resources of El Dorado county.

William D. Gordon, for the past seven years manager for the Mine & Smelter Supply Co. at El Paso, has been elected president of Camphuis, Rives & Gordon, Inc., and has opened American headquarters for the company at 81 New street, New York.

J. W. Crowdus has been commissioned as First Lieutenant in the Engineer Reserve Corps. He reported for duty at Camp Lee, Virginia, August 3. Mr. Crowdus has just completed a 300-ton concentrator of his own design for the 85 Mining Co. at Lordsburg, New Mexico.

THE METAL MARKET

METAL PRICES

San Francisco, July 30

Aluminum-dust, large and small lots, cents per lb	65—70
Antimony (wholesale), cents per pound	15
Copper, electrolytic, cents per pound, in carload lots	26.00
Copper, electrolytic, cents per pound, in small quantities	27.35
Lead, pig, cents per pound	8.30— 9.30
Platinum, Government price, per ounce	$105
Quicksilver, per flask of 75 lb	$120
Spelter, cents per pound	11
Zinc-dust, cents per pound	17½

ORE PRICES

July 30

Antimony, 45% metal, f.o.b. California, per unit	$1.10
Chrome, 38 to 48%, California, per unit	$1.25—$1.50
Fluorspar, 85% CaF_2, f.o.b. shipping point, or San Francisco per ton	$22—$30
Magnesite, crude, California, per ton (nominal price)	$7.00—$8.00
Manganese, domestic, 35 to 54%, f.o.b. South Chicago, per unit (Government price, effective May 29)	$0.86—$1.30
Manganese, domestic, 35 to 54%, f.o.b. east of South Chicago, per unit (Government price, effective May 29)	$1.01—$1.45
(Manganese, domestic, penalty of 50c. to $1 per ton for 8% and up to 25% silica, and bonus of 50c. to $1 for less than 8 and 5%.)	
Molybdenite, per lb., 90% MoS_2	$1.00
Pyrite, per unit of sulphur, cents	28
Tungsten, 60% WO_3, California, per unit	$20—$24

EASTERN METAL MARKET

(By wire from New York)

July 30.—Copper is unchanged, but strong. Lead is scarce and firm. Spelter is dull and weaker.

SILVER

Below are given official (not Government) quotations, in cents per ounce of silver 999 fine. In order to make prompt settlements with smelters and brokers, producers allow a discount from the Government price of $1, hence the lower price. The Government has not fixed the general market price at $1, but will pay this price (as from April 23, 1918) for all silver purchased by it. The equivalent of dollar silver (1000 fine) in British currency is 46.65 pence per ounce (925 fine), calculated at the current rate of exchange.

Date	New York, cents	London, pence
July 24	99.62	48.81

Silver exports in the fiscal year ended June 30, 1918, totaled $139,000,000, an increase of $61,000,000 over the previous year. Imports amounted to $70,000,000, double those of a year ago.

COPPER

On September 21, 1917, the Government fixed copper prices at 23.50c. per lb. for large lots, and 24.67½c. for small lots, effective until June 1, 1918. On this date the prices were re-fixed until August 15; but on July 2 the price was increased to 26c. and 27.35c., respectively, until August 15. Quotations in cents per pound are as under:

Owing to some uncertainty regarding the application of the restriction imposed by the War Trade Board upon the importation of copper ore, the Board has altered the original ruling to read that hereafter no licenses will be issued for the importation of copper concentrates containing less than 60% of copper, except for shipments from Cuba, Canada, and Mexico. All outstanding licenses for the importation of copper concentrates containing less than 60% have been revoked as to shipments from abroad after July 20, except for shipments from the three countries above specified, from which copper ore may be imported. This restriction is not to be construed as affecting the importation from any non-enemy country of copper matte or blister copper, or copper concentrates containing 60% or more of copper. The purpose of the new ruling, as of the former one, is to bring about the ocean transportation of copper in a concentrated form rather than as the bulkier ore.

LEAD

Lead is quoted in cents per pound, New York delivery. Government metal receives 7c. per lb. until August 6. Early in July producers agreed to fix prices at 8.05c. per lb., New York.

Lead ore at Joplin last week was stronger at $100 per ton, an advance of $2.50, basis of 80% product.

ZINC

Zinc is quoted as spelter, standard Western brands, New York delivery, in cents per pound. On May 25, 1918, the Government fixed prices until September for grade A spelter at 12c. per lb. for itself and the open market. Lower grades can make their own prices as usual. Sheet-zinc is fixed at 15c., and plate at 14c. per pound.

Owing to a weaker spelter market last week zinc ore at Joplin fell off $2.50 to $5 per ton, the base price for 60% product being $50 and $52.50 per ton.

QUICKSILVER

The primary market for quicksilver is San Francisco, California being the largest producer. The price is fixed in the open market, according to quantity. The Government is taking 40% of the United States quicksilver output, paying therefor $105 per flask. Outside of this business the competitive market can make any price as usual. Prices, in dollars per flask of 75 pounds:

ORES (New York)

Ferro-manganese: The market is quiet but strong at $250 per ton, delivered, for 70% alloy, plus $4 per unit above this standard. Imports for June, so far reported, were 5739 gross tons, the largest for any month this year.

Molybdenum: The market is easier with sales at $1 per lb. of MoS_2 in 90% concentrate.

Tungsten: The supply of high-grade ore is not equal to the demand, according to one dealer. Prices range from $18 to $20 for low-grade up to $24.50 per unit for 60% concentrate, and higher. There is no change in ferro-tungsten.

Eastern Metal Market

New York, July 24.

The news feature of the week, affecting all the markets, is the announcement of the virtual taking over or confiscation by the Custodian of Alien Property, A. Mitchel Palmer, for the Government, of L. Vogelstein & Co., Beer, Sondheimer & Co., the American Metal Co., and some lesser companies. These are some of the largest if not the largest producers of zinc, copper, and lead in the country. It means the Americanization of these companies, perhaps for all time.

The markets in general are quiet but mostly firm, with prices all stationary.

An advance in copper is predicted after August 15.

Tin is quiet and still scarce.

Lead is harder to buy than ever before, but quotations are held in check.

Zinc is inactive and slightly easier, but firm.

Antimony is fairly active and steady.

Steel producers have been made to understand, during the last week, more impressively than ever what demands are to be made on the industry in the last half of this year and the still greater ones in 1919. Next year the shipbuilding program is to be increased beyond anything yet believed, and railroad purchases will far exceed those for 1918. Even shell-steel must be furnished at a 5,000,000-ton rate. The War Industries Board has put the country's war and essential needs of finished steel at 20,000,000 tons for the last half of the year or 3,500,000 tons more than the expected output.

COPPER

A further advance in the Government maximum price is confidently discussed, and is even expected by some as a result of the next meeting in Washington on August 7 when a settlement of the price to become effective after August 15 is made. It is claimed that the sudden advance of 2½c. per lb. to 26c., made on July 2, does not cover the increased costs, and that 1½c. per lb. is absolutely necessary. This may have been foreseen at the meeting on July 2 so that instead of making a 4c. advance for August 15, part of it was authorized at once. This has resulted in so much confusion, especially following as it did an official announcement that no changes would be made before August 15, that all sales now are at the price ruling at the time of delivery. The fixed jobbing price of 5% above the wholesale maximum price is now $1 per ton higher, or 27.35c., instead of 27.30c. per lb. This is because the refiners are allowed an increase of this amount to recompense them for putting the metal in ingot form. Copper exports are considerably behind those of a year ago at this time. For the first half they are estimated at 186,370 gross tons, against 274,763 tons in the first half of 1917, or a decrease this year of about 32%. The June exports were 31,791 tons, exclusive of those to Canada, or about 10,000 tons less than those for June 1917. It is stated that the estimated output of refined copper for the first half of this year shows a net decrease of 50,000,000 lb. from that of the same period of 1917.

TIN

The market continues extremely quiet with practically no business being done. The only transactions reported have been a few in Banca and Chinese tin afloat. A sale is noted at 94c., New York, ex-steamer to arrive. Offerings of future shipment from the East, or from England, are almost entirely absent. This is due to new developments in the last few days, which are regarded as not only interesting but of decided importance. Announcement is officially made in England that the Federated Malay government has instituted a new ruling that sellers cannot ship tin except under license from that government and that such sales must be made on the basis of the Singapore and Penang quotations, plus expenses to London and New York and a reasonable profit. This is regarded by some as a ban on shipments to a certain extent. It amounts at least to price-fixing, and will ultimately affect the price of Banca and Chinese tin in this country. The effect and import of the new ruling is not clearly understood as yet, either here or in England, but it is regarded as far reaching. That this is so is evident from the fact that the lack of offerings from London is acute because sellers are apparently feeling their way. The quotation for spot tin in New York continues nominal at 94c. per lb., with none available in quantity. Isolated lots have sold up to 98 to 99c. per lb. Arrivals at Pacific ports continue large. To July 20 inclusive they have been 4280 tons, with those at Atlantic ports at 600 tons to July 17. The advance in the London market continues with spot Straits £10 per ton higher than a week ago, or £365 10s. per ton yesterday.

LEAD

A large wholesale dealer in lead said today that in his experience the metal was never more scarce. It is almost impossible to secure it for any reasonably early delivery. Most large producers have sold their output and some have oversold. The quotation is held by agreement at 7.75c., St. Louis, or 8.05c., New York, but there have been a few instances of sales of small lots above this level. A little spot metal went at 8.20c., New York, a few days ago and some dealers have sold one or two carloads at 8.75c., New York, to consumers greatly in need of the material.

ZINC

The report of the zinc output for the second quarter, published in the papers last week, has been of considerable interest. It reveals to what extent production has declined. The domestic output for the second quarter was 127,000 tons, or 9000 tons less than that for the first quarter this year, and 60,000 tons less than that for the second quarter of 1917. It is the lowest output for any quarter in the last three years, the next lowest having been 121,624 tons in the second quarter of 1915. The report also shows that producers having 196,000 retorts had only 111,000 or 57% in operation on July 1, or a decrease of 13,000 retorts from those operating April 1, 1918. Stocks of zinc also have declined. They were 46,000 tons July 1, or 18,400 tons less than those on hand April 1. This is a decrease of about 1400 tons per week. It would be natural to expect such a report to affect the market for an advance or at least to bring out inquiry. On the contrary, there is very little doing and, if anything, the market is easier. Sales were so large a few weeks ago that producers are comfortable and consumers not at all anxious. As a result little has happened to test the market. The quotation is regarded as partly nominal at 8.37½c., St. Louis, or 8.62½c., New York, for early delivery, with no one quoting for last quarter. There have been sales of small amounts at this level, also some at 8.50 to 8.60c., St. Louis. The market is not at all active but is considered temporarily reactionary but strong fundamentally.

ANTIMONY

In 5-ton lots or less, 13.25c. per lb. is asked for antimony, New York, duty paid, but in larger lots the quotation is about 13.12½c. The market is moderately active.

Company Reports

UNITED STATES SMELTING, REFINING & MINING CO.

Properties: mines and works in Arizona, California, Colorado, Utah, and Mexico.

Operating Officials: of U. S. S., R. & M. Co.: G. W. Heintz, general manager of Western operations; C. E. Allen, manager of mines; O. J. Egleston, chief engineer; L. D. Anderson, manager Midvale smelter; J. F. Barnard, superintendent Bingham mines; A. P. Mayberry, superintendent Centennial-Eureka mine; G. W. Metcalfe, manager Mammoth plant; R. E. Hanley, superintendent Mammoth mine; J. H. Kervin, superintendent Mammoth smelter; D. R. Muir, manager Gold Road and Needles properties; A. R. Campbell, manager zinc smelter; D. D. Muir Jr., manager zinc mines; A. P. Anderson, consulting mining engineer;. C. F. Moore, consulting engineer; and G. W. Cushing, traffic manager. Of U. S. S., R. & M. Ex. Co.: Sidney J. Jennings, in charge of exploration and mining investment; C. W. Van Law, general manager of exploration in Mexico and Colorado; G. W. Heintz, general manager of Western exploration; and E. N. Funston, engineer. Of Richmond-Eureka Mining Co. and Niagara Mining Co.: G. W. Heintz, general manager. Of Compania de Real del Monte y Pachuca: Salvador M. Cancino, president, D. S. Calland, director. Of U. S. Metals Refining Co.: F. Y. Robertson, general manager; R. W. Deacon, superintendent copper refinery, Chrome, N. J.; and William Thum, superintendent lead refinery, East Chicago, Indiana. Of U. S. Fuel Co.: R. M. Magraw, general superintendent. Of Sunnyside Mining & Milling Co.: J. W. Steele, superintendent. Of U. S. Stores Co.: J. H. Horlick, manager.

Financial Statement: the profit from all companies for 1917 was $4,197,815. This, added to the undistributed surplus from 1916, made $17,155,270 available. Of this, $692,500 was applied to taxes, etc., and $3,457,800 to dividends, leaving a surplus for 1918 of $17,155,270. Current assets total $17,493,387, and liabilities $8,788,044, leaving an excess of assets of $8,705,343. Capital expenditures and investments in 1917 totaled $6,462,199.

Dividends: preferred shares received 7%, or $1,702,225; and common shares $5 each, or $1,755,575.

Production: the Centennial-Eureka, Mammoth, Ritz, Tennessee, Bingham, and Mexican mines produced 1,129,678 tons of ore. Metals extracted, including custom ore, were

Copper, pounds	29,043,242
Gold, ounces	109,612
Lead, pounds	107,519,570
Silver, ounces	13,000,187
Zinc, pounds	53,590,446

Coal mined amounted to 908,638 tons.

General: in Utah, reserves were materially increased at the Bingham Mines property. Orebodies persist with undiminished strength to the Niagara tunnel. In the Centennial-Eureka ore extraction was carried on mostly near old stopes. Results at the Bullion Beck and Champion were only fair. The smelter at Midvale operated to capacity.

In Oklahoma, owing to the zinc market, all reduction was stopped save at the Checotah smelter. The Ritz mine and mill gave good results. On the Naylor tract in Kansas, drilling justified erection of a mill.

In California, in the Mammoth mine proper and Section 29, no large deposits were opened. The most important work was extending the Friday Lowden tunnel, including branches, to 7500 ft., and completion of Sutro 29 tunnel, 2500 ft. long. High-grade ore was opened from the Friday tunnel, also from the Sutro. The mine produced 164,540 tons of ore. The Stowell mine, 7 miles from the Mammoth, was equipped with an aerial tram. Ore sent to Kennett—18,497 tons—practically exhausted the reserve. Further exploration is under way. The Keystone claims give promise of being producers. The Anderson and Spread Eagle claims were not worked on account of prevailing conditions. The smelter reduced 345,990 tons of mixed ores, a large quantity coming from the Balaklala company. The electrolytic zinc plant worked satisfactorily.

In Arizona, only exploration was done at the Gold Road mine, with fair results. The lease on the Tennessee mine was surrendered as the remaining ore was unprofitable. The Needles concentrator was also closed.

In Colorado, the Sunnyside lead-zinc mine was taken under control, and a mill is being erected. The Leadville unit did not develop any profitable ore in the lower limestone, nor in the upper horizon. Work has been stopped altogether.

In Mexico, transportation and supplies were difficult to secure for Real del Monte. Trains were run on company account to the United States border. By mid-year full capacity was reached, and for 6 months the two mills treated 54,600 tons monthly, 10% above rated capacity. Both plants are being increased by 9000 tons each per month. A third mill may be erected to treat ore from the new vein, which is developing well.

In Alaska, a little work continues at the Ebner mine.

UTAH CONSOLIDATED MINING CO.

Property: 43 claims in the Bingham district, Uath.

Operating Official: Fred Cowans, manager.

Financial Statement: revenue from metals produced amounted to $3,395,109. Miscellaneous income in 1917 made a total of $3,496,806. Mining, smelting, and general charges were $2,684,612, leaving a profit of $812,194. Balance to credit at January 1, 1917, was $1,867,842; and carried forward to 1918, $1,541,165.

Dividends: totaled $1,050,000, equal to $3.50 per share.

Development: New work from 600 to 1300 ft. depth covered 29,206 ft. Generally, results were satisfactory, although it required 13% more exploration to maintain reserves at the previous estimate. Ore developed amounts to 141,000 tons of copper ore, averaging 1.76% copper, 0.65 oz. silver, and 0.05 oz. gold; and 31,000 tons of lead ore assaying 14.90% lead, 0.61% copper, 4.96 oz. silver, and 0.06 oz. gold.

Production: shipments to the International smelter at International, Utah, consisted of 226,536 tons of copper ore and 58,247 tons of lead ore. These yielded 7,968,165 lb. copper, 13,014,841 lb. lead, 408,560 oz. silver, and 13,530 oz. gold. Copper-ore production was limited by coal shortage at the smelter.

ROSE DEEP, LTD.

Property: 365 claims (1½ acres each) on the Rand, Transvaal.

Operating Officials: A. J. Walton, manager; consulting engineer; E. E. Clifford (H. Stuart Martin, acting).

Financial Statement: during 1917 the revenue from gold was £837,992 ($4,020,000), and expenditure £579,079 ($2,780,000). Government taxes totaled £29,989 ($143,000). The balance of £111,027 ($533,000) at end of 1916 was increased to £130,690 ($624,000) at end of 1917.

Dividends: two of 12½ and 17½% amounted to £210,000 ($1,008,000), making £3,391,875 ($16,300,000) to date.

Development: new work amounted to 7190 ft., 70% of which was in pay-ore, and exposed 532,110 tons. Reserves are estimated at 3,219,700 tons, averaging $5.40 per ton. By means of sand-filling a number of pillars can be mined.

Production: after 10.2% of waste assaying 39.4c. per ton was sorted out, the 300 stamps, 7 tube-mills, and cyanide works treated 689,859 tons of $6.19 ore. The actual extraction was 94.4%, yielding 200,811 oz. of gold.

Costs: all departments totaled 16s. 11d. ($4.06) per ton, a decrease of 8 cents.

INDUSTRIAL PROGRESS

INFORMATION FURNISHED BY MANUFACTURERS

JORDAN SPREADERS

Over thirty years ago, Oswald F. Jordan saw the possibilities of a machine for spreading and leveling materials and for saving time, labor, and money by dispensing with slow expensive 'gang labor', which is uncertain and undependable. This resulted in the invention of the 'Jordan spreader'. Since that time the Jordan spreader has been

A SPREADER WORKING AT AN IRON MINE

adopted by nearly all of the railways of the United States and Canada, together with numerous installations in connection with mines, smelters, steel plants, and various classes of contracting work. Many of the original spreaders are still in operation, and have saved their owners large sums of money by eliminating gang labor. Many instances of Jordan installations have been reported where, by its use, its original cost was saved in less than a week.

The Jordan spreader moves, levels, and spreads clay, rock, slag, ore, debris, coal, coke, or other materials at a cost of 0.5 cent per cubic yard which is, by comparison, the lowest cost attained by any mechanical device. In open-cut mine operations, in the handling of smelter slags, in ore and coal-storage problems, in large-scale mine operations, in railway construction and maintenance, in disposing of dump-material and mill-tailing, the Jordan has proved itself a labor-saver that is second to none. Where more than eight men are employed on this class of work the Jordan soon pays for itself. Its construction is of steel throughout, with every detail so perfected as to make it last indefinitely with little or no up-keep charge. It is driven by one man, being easily controlled by a hand lever which operates the valves on the pneumatic cylinders. The Jordan spreads material 21 ft. from the centre of the track, and can be adjusted to spread and remove material to a depth of 21 inches. The spreader is 35 ft. long, 13 ft. high, and weighs 72,000 lb. It is equipped with Westinghouse air-brakes and standard hand-brakes. The spreader performs the function of a ballast-plow, flanger, scraper, bank-builder, spreader, and snow-plow, and is equipped for building high banks, ditching, and making shoulders to any standard. All operations are under the control of one man and uses an ordinary locomotive to supply the power. The illustration shows a Jordan spreader in operation at the plant of the Oliver Iron Mining Co. Here, as at the Utah Copper Co., the New Cornelia, the Calumet & Arizona, and other mining and smelting companies, the Jordan has been rendering a variety of services in the moving and spreading of material, dump building, track-work, and the like. As to the cost of operation, one Jordan spreader, working at a speed of only 1.36 miles per hour, can spread 75,000 cu. yd. of material in 10 hours. The cost of doing this work is as follows:

One locomotive and crew	$42.00
One operator	5.00
Oil, waste, etc.	2.50
Total	$49.50

To do the work by gang labor, figuring that one man can spread 30 cu. yd. per 10 hr., and putting his wage at $2.50, it would require the services of 2500 men at a cost of $6250. These figures are on a conservative basis, as the spreader has generally operated at a rate of from 6 to 8 miles per hour, and on all classes of material under the severest conditions. The Jordan spreader is manufactured by the **O. F. Jordan Co.**, at Chicago and Kennedy Ave., East Chicago, Indiana. Complete information as to the operation and use of Jordan spreaders on all classes of work will be submitted on request, together with estimates.

A large number of the architects, engineers, and contractors of San Francisco, on the invitation of **The Paraffine Companies, Inc.**, witnessed the application of Pabcoat—the stone veneer—by the air-spray method. The coating was applied to the interior of a new building recently erected for the Enterprise Electric Co. The purpose was to show that the owners were saving, on a conservative estimate, 30% in the cost of painting the building. One application of 'Pabcoat' by the air-spray method made a finished job equal to two coats applied by hand and at a great saving in time. The adaptability of 'Pabcoat' to practically any surface and its well-known fire-retarding qualities, caused a great deal of favorable comment.

The Allis-Chalmers Manufacturing Co. calls attention to its bulletin No. 4028, describing a pulverizer constructed on a new principle. It is termed a 'pulverator', being designed for the reduction of material from 3 in. to pass a 20-mesh screen. It is intended mainly for relatively soft material, such as cement clinker, limestone, coal, shale, feldspar, phosphate rock, gypsum, bauxite, and slag. A machine crushing 15 tons per hour requires 40 horsepower.

ONE OF
PACIFIC TANKS AND PIPE PRODUCTS

24-in. Continuous Wood-stave Pipe installed for the Cuyamaca Water Company near Murray Dam, San Diego, Cal., in 1896, at the same time that the first dam was being built. In 1917 a new concrete Eastwood multiple arch dam (as shown above) was found necessary to replace the old one, but the original continuous stave pipe still rendered its usual efficient service.

Long Life and a Useful One

are points that help establish our customers as **repeaters.** This fact is unusual, too, in the face of ordinary periodical buying of a product of this kind. Then there is the fact that water preserves the wood rather than rusting it or decreasing the volume of the inside by tubercles.

Drinking water conveyed in Pacific Wood-stave Pipe is delivered cool and pure and free from disagreeable taste or any accumulated impurities. Less expense is involved in hauling and laying.

The present Government orders to curtail the use of iron and steel establishes Wood-stave Pipe as a product **built for the hour.**

Serve best by saving most. Right now,—specify and install Pacific Wood-stave Pipe.

NOTES 173

THE STATUS OF GOLD 174

Increased cost of labor and supplies; total increase since 1914 about 40%; extinction of profit in gold mining; cost of living and its influence in the industry; migration of gold miners to copper districts; gold mining accorded priority rights; immunity from taxation useful, but insufficient; the best remedy to pay a bounty on gold produced; this subject to be discussed at the meeting at Reno called by Gov. Boyle. M. & S. P., August 10, 1918.

THE METAL-DEALERS CLIQUE 175

Revelation of how the British Minerals Separation company after war was declared continued to do business with two Germans representing a German firm in New York; ramifications of Beer, Sondheimer & Co. in the American metal business; the Vogelstein company and its activities on behalf of Germany; information furnished by the Alien Property Custodian regarding the American Metal Co. and its numerous subsidiaries; origin of the Jewish German metal combine; proposal to sell these properties by the Alien Property Custodian; better means required for protecting the metal-selling interests. M. & S. P., August 10, 1918.

DISCUSSION

THE MENACE TO GOLD MINING

By J. A. Burgess and M. T. Chestnut 177

Gold mining placed on the priorities list; necessity for encouraging the industry; two ways in which the Government may stimulate gold production; gold won at no profit to the producer is as useful in the Treasury as that produced at a good profit; paying a bounty would be an expense rather than a waste.——Mining in Colorado seriously affected, notwithstanding high prices for metals; production in the State decreased $8,000,000 last year; Government must advance the prices of metals; the small operator must be sustained. M. & S. P., August 10, 1918.

FORMULAS FOR MINE-VALUATION

By W. W. Whitton 179

Not sufficient to define a 10% investment in a wasting asset as one that will pay 10% per annum and return the capital at the end of the investment period; comparison of results with the Hoskold and the Whitton formulas; six ways of solving the problem, based on the definition, giving discordant results; a mine investment not the same as an investment in bonds. M. & S. P., August 10, 1918.

ARTICLES

THE CALUMET & ARIZONA SMELTER

By Courtenay De Kalb 181

Sources of ore; utilizing roaster-fume to make sulphuric acid; outline of the plant; the sampling works; the Mathewson type of blast-furnace used; blast-furnace products; construction of the reverberatory furnaces; side-charging employed; increase in capacity by new method of charging; effect of side-charging and short-flame firing on matte-separation and fuel-economy; Great Falls type of converter; table of converter-products. M. & S. P., August 10, 1918.

THE MENACE TO GOLD MINING 188

Statement prepared by Chas. G. Yale, showing difficulties under which the gold miners of California are laboring; output of gold in the State. M. & S. P., August 10, 1918.

MINERALS SEPARATION AND BEER-SONDHEIMER—A CHRONOLOGY 189

Relations of Minerals Separation to Beer, Sondheimer & Co., as shown by corporation records; connection of Benno Elkan and Otto Frohnknecht in New York with M. S. and B. S. & Co. M. & S. P., August 10, 1918.

THE 7000-FOOT TUNNEL AT LAHAINA, HAWAII

By Fr. Koelling 190

Tunnel of horse-shoe section, 6 by 6 ft. inside, designed to conduct 50,000,000 gal. of water daily; power and machinery used; difficulties of construction; maximum progress 37.64 ft. per diem; cost per foot $11; lining estimated at $2 per foot. M. & S. P., August 10, 1918.

CALCULATING PERCENTAGE OF RECOVERY IN CONCENTRATION

By Arthur H. P. Moline 192

Formula for calculating percentage of recovery when only weight of concentrate, and the assay value of feed and tailing respectively, are known. M. & S. P., August 10, 1918.

STANDARD METHOD FOR ZINC-LEAD ASSAY

By W. George Waring 193

Discussion of methods of assay used in the Missouri zinc-lead districts; report of committee of chemists recommending a standard method. M. & S. P., August 10, 1918.

WATER AND ELECTRICITY

By T. D. MacCormack 194

M. & S. P., August 10, 1918.

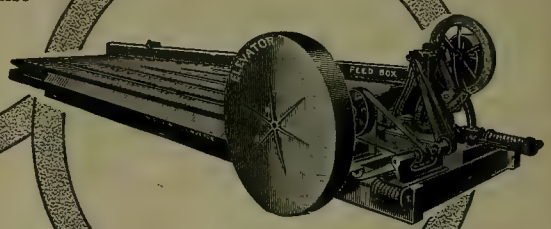
Changed?

No. 9 Double Deck Wilfley—two concentrating tables in one—this is the supreme achievement in Wilfley Tables. **The Wilfley of today**—made also single deck, of course.

NO!—Improved



A Deck of the No. 1 Wilfley Table

Twenty years ago the first real concentrating table appeared. It was the Wilfley and it practically revolutionized concentrating practice. Up to now over 22,000 Wilfleys have been sold, and they are noted today for metallurgical efficiency—large capacity and small upkeep. Yet the latest

WILFLEY TABLE

looks but little like the old No. 1 Wilfley. Has the Wilfley changed? No—but it has been constantly improved.

The Wilfley basic principles were right—so good that on these time-tested principles we have been able to build improvements showing highest efficiency in capacity and in extraction.

The mechanical perfection of the Wilfley, and its extreme simplicity of construction insures lowest operating and maintenance costs.

Write us about your concentrating problems. Our engineers will gladly co-operate in studying your requirements.

New York Office: 42 Broadway

LYING on a cot, wounded, after a glorious fight, a soldier boy said: "Tell the folks at home that we may not all come back, but that we are winning the war." They are, God bless them!

EXPORTS of silver during the first six months of the current year amounted to $139,000,000, as against imports of $70,000,000. Most of the outgoing metal went through San Francisco westward to settle trade-balances in the Orient. The silver miner is doing good work for the Nation.

WE are requested to state that the Field Artillery is in need of officers. This is a branch of the Army particularly suitable for mining engineers. A training-school has been established in Kentucky. Candidates must be between 20 years 8 months and 40 years of age. Applications should be addressed to the Field Artillery Central Officers Training-School, Camp Zachary Taylor, Louisville, Kentucky.

FOR the third time George Graham Rice, whose real name is Jacob Simon Herzig, has been indicted for fraud, this time in New York. He has been in prison twice for similar offences in connection with the raising of money for mining schemes. We have but scant sympathy for his dupes, of whom there must be thousands, because the true character of his financial operations has been exposed again and again. It is astonishing that a man so infamously known should have been able repeatedly to create a large and successful promoting business.

DECIMAL systems are gaining ground. Although the English-speaking peoples have been disinclined to adopt the metric system, it is interesting to note that the idea was accepted for American coinage long ago and it is now about to be introduced into the coinage of Great Britain, where a bill to that effect is before Parliament. It is proposed to continue the sovereign and the florin, which is two shillings or one-tenth of a sovereign; in addition, a new coin, equal to one-hundredth of a sovereign, and equivalent to the American nickel, is to make its appearance. Moreover, a new farthing, equal not to a fourth, but to a fifth of the penny, is to be minted. Presumably the new penny will be a two-hundredth, instead of a two-hundred and fortieth of a sovereign, making it therefore one-twentieth of a florin. All this is in the direction of scientific progress.

CONTROVERSY seems to have arisen between the chemists in charge of sulphuric-acid manufacture and a committee representing the jewelers, over the commandeering of platinum. Mr. B. M. Baruch stated emphatically last January that "the shortage of platinum in the production of explosives is such that it is necessary for the Government to have command of every bit of platinum that can possibly be had." He requested that the further manufacture of platinum jewelry be discontinued. This would have necessitated finding other employment for 10,000 workmen engaged in that industry, and, as a result, a clash of interests has taken place. It seems certain that the Platinum Section of the War Industries Board has not enforced orders in keeping with the earlier declaration by Mr. Baruch. This soon must cause serious embarrassment in the production of munitions. The needs of a growing army cannot be met without an increase in the amount of sulphuric acid. Importations of pyrite are restricted because of insufficient shipping, and the domestic output will hardly make good the deficiency for many months to come. Also the construction of chamber-plants requires so much time, and demands so many laborers, both in the supplies needed and in the actual erection, that the only certain remedy is to increase the production of contact-acid, and for this purpose no satisfactory substitute for platinum has been found. Persistence in the manufacture of the most wasteful of luxuries on the plea that it would effect a small group of workmen is trifling with the welfare of the Nation. Skilled metal-workers of any kind can find proper use for their talents in the necessary duties of the hour. We surmise that it is the jewelers, facing a loss of manufacturing profit, rather than their employees, who have been responsible for the effort to hamper the commandeering of "every bit of platinum that can possibly be had."

SHORTAGE of electric power in California, due in large part to the diminished rainfall last winter, makes it necessary that all users of current exercise rigid economy. The California Railroad Commission believes that careful conservation will obviate the neces-

sity for applying priority regulations. Accordingly, the power administrator, Mr. H. C. Butler, has issued a circular asking the managers of gold mines and dredges in the central and northern parts of the State to arrange as far as possible to operate their heavy loads between the hours of 10 o'clock at night and 7 in the morning. This is a reasonable request, and compliance with it may avert the necessity of restricting further the distribution of electric energy. At one time the power companies had prepared a priority list that would have discriminated against the gold industry, but the recent ruling of the War Industries Board, recognizing gold mining as a war-essential, removes the danger of such adverse action. The gold miners, however, will be obliged to pay an additional two mills per kilowatt-hour, in accordance with the decision of the California Railroad Commission allowing a general increase of rates. Hitherto power used for hoisting cost 1.5 cents and for other purposes in connection with the mines 1.25 cents per kilowatt-hour, with the exception of the Electra district, which includes the Mother Lode counties, where the price was 0.826 cent on a rated capacity exceeding 100 horse-power. The charge for gold dredging has been 0.75 cent per kilowatt-hour. In all cases the current is delivered and metered at the primary voltage, and the consumer is required to provide the necessary transformers.

THE wiles of Germany stop not at the sacrifice of exalted personages if thereby the political objects of the rulers may be advanced. The world is now persuaded that the murder of the Archduke Ferdinand was a palace plot to entangle Serbia and create a pretext for the casus belli universi. This gives a clue to the mystery of Hindenburg, with the difference that he becomes the goat, in the ancient occult sense, because he was first of all a *hinderung* and a *drohung* to the royal house that constitutes, as Hegel said, the 'apex of the State.' The Field Marshal had proved himself the master brute, the man of the earth earthy, with the force to make savagery worshipful by those who translate might into majesty. In other words, Hindenburg's campaigns had led to a preponderance of success over failure; he had driven for the ends that accorded with the national aspirations; the dominance of Germany was more to him than spectacular victory; thus in his utter materialism he expressed more definitely than Kaiser Wilhelm the popular German ideal. The spectacular in war is a royalist tradition, an imperial necessity from the remotest epochs. The impulse to figure in it is one that autocratic rulers cannot resist for long without sacrifice of some part of that divinity that hedges kings. Thus we hear of the anxiety displayed by the Crown Prince to put the seal of martial victory on his royal pretensions. He fretted under the stagnation of peace, which promotes the decay of thrones, and then, in war, he chose Verdun as the conspicuous fortress against which to hurl his army and to try to demonstrate his prowess. A fearful peril inheres in royal failure, and when the Hohenzollern failed, it was ominous to note that the people had been building a statue, like an image of devouring Baal, in honor of the hero who had given promise of augmenting the prestige of Germany. It was recognized that Hindenburg had achieved a degree of popularity that menaced the ascendancy of the Emperor; a little more and he might be able to dictate as another Bismarck, with the added strength of personal military success as his warrant. He is said to have counselled demonstrations on the West sufficient to retain the option there of offensive action, and at the same time to drive hard at Italy, at Greece, and down the Euphrates, while Russia was being subjected to a mixture of political and military penetration; then suddenly he faded into mystery. The master must score first, the idol must prove to be altogether of clay and lacking imperial vision. First Ludendorff was brought forward as the supreme and willing servant to confound his rival; next Mackensen is called to justify Caesar. Meanwhile Hindenburg flits from death to life and back again; at one time he is reported ill, and again he is merely taking a well-earned rest. This doubt regarding his fate is supposed to exert a favorable psychological effect on the Allies, for the German really believes himself to be a psychologist. It is well for us to realize these jealousies and dissensions among our enemies. The barbarian plunderers are not united in spirit as are the men outside that are fighting for lofty ideals. Who has heard even a whisper of pique between Joffre and Foch? Who has heard of Haig sulking in his tent, or of Pershing quibbling about precedence? They are dividing the labors as true democrats should, for they have no master with whom to curry favor except the people whom they represent in the struggle to maintain equality of opportunity and liberty for all men throughout the world. There is no harmony among the powers of evil, but among those that fight for the right exists a bond that makes them one and invincible.

The Status of Gold

Governor Boyle of Nevada has called a conference for August 12 and two following days to meet at Reno "for the purpose of discussing the ways and means to stimulate the production of gold in the ever-increasing operating costs, which at this time actually threaten the industry in the West." This conference is being organized in co-operation with the American Mining Congress and with the support of numerous Western metal-producers' associations. We hope it will be well attended, for it is most timely and important. Gold mining is menaced not only by the increasing cost of operation but by public ignorance of the first principles of economics. Briefly, the winning of gold from veins and placers is threatened by the advance in wages, which, since 1914, averages about 35%, and by the increased cost of supplies, ranging from 10 to 100%. The total cost of production has increased 33 to 40% in four years. Thus a mine operating at a cost of $3 per ton and producing $4.50 worth of gold per ton in 1914 would now operate at a cost of $4.20, which, in the face of increasingly unfavorable conditions,

leaves only a precarious profit. Meanwhile the purchasing power of gold has declined. Economists say that 'the cost of living' has doubled since 1914, but such a statement must not be taken literally, for it means only that the average price of a number of staple foodstuffs has been doubled, which is a very different thing from the total expenses of the ordinary citizen, because civilized "man does not live by bread alone"; his expenses include rent, clothing, lighting, water, and a number of other items among which articles of food represent about one-half—and the cost of *all* articles of food has not doubled, or anything like it—ask your wife. A fair estimate of the increased expenditure of the citizen since 1914 is 40%. Manifestly, if living expenses had doubled, it would be impossible for the laborer or artisan, not to mention the professional man, to escape bankruptcy. We would be facing economic chaos. However, the cost of living in most cases has risen more than wages, especially to the gold-mine laborer, whose pay has advanced from $2.50 to $3.25, or 30%, as against the advance to the copper-mine laborer, from $3.00 to $5.50, or 83%. Hence the migration from gold mines to copper mines, withdrawing the best labor of the mining districts most unfavorably affected by the War. The wages of the copper miner have risen faster than his living expenses, because he is producing a metal the value of which has appreciated abnormally, whereas the gold miner's pay has risen less rapidly than his cost of living. This means that a further tax—in the form of a bigger payroll—is inevitable if gold mining is to persist. The remedies suggested are various. The Priorities Board now rates gold mining with the metal-mining industry in general. In answer to a request for a definition of the status of gold mining under the recent order of the War Industries Board that placed it on the priorities list, Mr. B. M. Baruch telegraphed that the classification applying to gold mining gives it the same position as "coke-oven plants, mines, smelters, furnaces, rolling-mills, wire-drawing mills, pipe and tube-mills, employed in the production of fuels, metals, and metal products." The classification, which becomes immediately effective for the industry, is an amendment to circular No. 4 of the Priorities Division of the War Industries Board, section one, following subdivision *O* of section eight, page five, and covers the operation and maintenance of existing plants, but no new construction, expansion, or replacement. Gold mining, as yet, has been accorded no special favor at Washington. A gold mine requires only one car of freight monthly per $50,000 worth of gold. Immunity from Federal Taxation, relief from increased freight-rates, and the like, will help, but they will prove wholly inadequate. The suggestion to change the weight of gold in the monetary unit, or, as it is vulgarly and inaccurately phrased, "to raise the price of gold," is unworthy of serious consideration. After all, as Mr. Benedict said in our issue of August 3, "the price of an ounce of gold is an ounce of gold." A much better proposal is to pay a bonus on the gold as it is produced at the mine. Such a bonus has been paid on other metals: on lead in Canada, on copper in Russia. It is a practicable method of stimulating production, and we recommend the idea to the conference at Reno.

The Metal-Dealers Clique

On another page we publish the chronology of the dealings between the Minerals Separation company and Beer, Sondheimer & Co. It shows how, after Great Britain and Germany had gone to war, a British company continued to do business with two Germans that had been representing a German firm in New York; and how, even after the New York branch of the German firm had been black-listed by the British government, this British company entered into agreements with these same Germans. That they took steps, after the War had begun in Europe, to become naturalized in the United States is a fact the value of which we do not need to appraise. They still remained 'enemy-aliens' to a British company. What value is to be attached to their belated naturalization as American citizens is indicated by the report of Mr. A. Mitchell Palmer, the Alien Property Custodian, who, on July 22, took over the business of Beer, Sondheimer & Co., Inc., this being the camouflage corporation organized in August 1915 for the purpose apparently of overcoming sundry technical difficulties incidental to the War. Mr. Francis P. Garvan, director of the Bureau of Investigation, reported to Mr. Palmer that the New York corporation "was organized upon the advice of the German concerns," to which all the capital stock of the American corporation was issued. Messrs. Benno Elkan and Otto Frohnknecht became president and vice-president, respectively, "receiving exactly the same salary and the same percentage in the net profits of the business as was provided for them in the 1912 agreement with the German firm." They thought to cover their tracks by such simple devices, besides making contradictory statements as to the purchase of the German holdings. Mr. Garvan says: "It appeared also that for the sum of $240,000 Elkan and Frohnknecht purchased a property that during the year in which they purchased it yielded a profit of $2,000,000." According to the Alien Property Custodian, the Beer-Sondheimer company owned half of the National Zinc Co., and the entire stock of the Cuba Copper Company, the Cuba Copper Leasing Co., and the Norfolk Smelting Co., besides 30,000 shares of the Minerals Separation American Syndicate, Ltd. This firm of Beer, Sondheimer & Co. is reported to have assets in excess of $5,000,000, whereas L. Vogelstein & Company, annexed by Mr. Palmer on the same day, is credited with assets of over $9,000,000. Both are described as "German-owned metal concerns closely connected with the Metallgesellschaft of Frankfurt-am-Main," that is, the great metal-buying octopus whose tentacles were pictured in a chart published by the Federal Trade Commission and reproduced in our issue of January 19, 1918. It consists of an interlocking group consisting of the Metallgesellschaft, the Metallbank, and Henry R. Merton

& Co., the founder of which was Philipp Abraham Cohen, the English name of 'Merton,' like the word 'American,' being adopted for strictly business purposes. Mr. Ludwig Vogelstein is a naturalized American; for many years he has represented Aron Hirsch und Sohn, of Halberstadt, Germany. The business done during the last three years has averaged $70,000,000 per annum. Mr. Vogelstein drew 15% of the profit, besides an interest in the firm's business in Germany. In December 1916, Mr. Vogelstein formed a New York corporation, capitalized at $5,000,000, to take over the property held in partnership with Herr Aron Hirsch, claiming that his agreements with the German firm were terminated, but Mr. Palmer did not accept the explanation, contending that "the interest of Aron Hirsch und Sohn in the American business has continued to date and that except for Mr. Vogelstein's participation in the profits, all the assets of the American concern belong to the German firm." Mr. Garvan discovered that the Vogelstein company had stored large quantities of copper for delivery after the War to the Hirsch firm; he also ascertained that the latter had guaranteed notes for several hundred thousand dollars given to a New York bank by L. Vogelstein & Co. Mr. Palmer has taken control of the business and is in a fair way to learn more about the intricacies of the metal trade. The Vogelstein company, on behalf of Aron Hirsch und Sohn, controls large holdings of stock in the United States Metal Refining Co. and the American Zinc, Lead & Smelting Co., which, in turn, controls the Wisconsin Zinc Co., American Zinc Co. of Illinois, the American Zinc Co. of Tennessee, the American Zinc Ore Separating Co., the American Pipe Line Co., and the Oglesby Gas Co. Assuredly 'American' is a good old name, but sometimes it is overworked. Concurrently, Mr. Palmer has published sundry items of information concerning the American Metal Co., whose business passed into his safe hands a short time ago. Of the 70,000 shares of the American Metal Co., 15,180 shares are owned by the Metallbank at Frankfurt and 18,180 shares by the Metallgesellschaft in the same famous city. This official statement may be compared with the statement made by Dr. Otto Sussman in a letter published in our issue of March 16, 1918, in which he had the effrontery to state that 97.7% of the stock of the Compañia de Minerales y Metales, with which he was identified, was held by the American Metal Co., "which is controlled by British and American interests." According to Mr. Palmer, the American Metal Co. completely owns the American Zinc & Chemical Co., Bartlesville Zinc Co., South American Metal Co., and four other companies of less importance; it also has "large holdings of stock" in the Ohio & Colorado Smelting & Refining Co., Compañia Minera de Penoles, Compañia de Minerales y Metales, Compañia Metalúrgica de Torreón, Compañia Minera Paloma y Cabrillas, Compañia de Combustibles Agujita, Fundición de Guayacán, the Balbach Smelting & Refining Co., and the Nichols Copper Co. This is a formidable array, but, large as it is, it is not complete. These German firms are said by Mr. Palmer to have "dominated the metal market of this country in such manner that they were enabled to sell copper, aluminum, zinc, and other metals in Germany at a price much lower than the American consumer had to pay." It is announced officially that "in taking over these and other metal businesses the Alien Property Custodian has smashed for all time the German control of the metal industry in this country." We hope he has. The publicity given to their ramifications will help greatly. The War has removed the lid. Our readers will remember that the first exposure of the metal-dealers' clique was made at Adelaide, South Australia, on December 12, 1914, in court proceedings against Francis H. Snow, a metal-buyer whose office was raided and whose letters disclosed his correspondence with the three firms now in Mr. Palmer's care, with Aron Hirsch & Co., and with Henry R. Merton & Co., in London, then the agents of the Metallgesellschaft, but since reorganized by order of the British government. Those letters indicated the interlocking of interests and the efforts made to get copper to Germany after hostilities had begun. As intimated before, we regard this clique as a non-national coterie co-operating to make money at the expense of the metal-producers, by the control of the channels of sale. That it was German was a coincidence, fortunate in so far as the War interfered with its machinations; that it was Jewish is due largely to the nature of the business, which renders it attractive to the Hebrew mind. We question whether it was organized as a part of the Pan-German scheme; we think that, in its inception, it was non-national, just plain 'peeziness,' always willing to deal with any customer, and that it found Germany the principal buyer in those years of preparation that preceded the outbreak of military bestiality in 1914. Whether the metal-dealing clique was a phase of German penetration or only another manifestation of organized non-national cupidity, we leave it to others to decide, but we do insist that it was a menace to the mining industry and it will continue to be a menace until it is completely stamped out. The transfer of power from German hands is highly satisfactory, but it must be noted that Britons and Americans participated in the operations of the clique before the War and it is imperative that the whole method of selling metals—more particularly of fixing the prices of metals—be analyzed and exposed ruthlessly. It is stated that the metal businesses seized by the Government are to be sold by the Alien Property Custodian. This will involve several large and important transactions, under cover of which the assets of these German firms may pass to other groups quite as likely to make an effort to establish a control hurtful to the mining industry. Patriotism is foreign to speculation in metals. The mining industry has too long been at the mercy of the metal-selling agencies. The American Institute of Mining Engineers or the Mining and Metallurgical Society of America could do much to justify their national names by making a serious effort now to investigate and rectify the matter, in co-operation with the Alien Property Custodian.

The Menace to Gold Mining

The Editor:

Sir—In your issue of July 20, you discuss the necessity for sustaining the production of gold, and ways in which it can be accomplished. In the same issue W. J. Loring describes the difficulties under which gold mines have been operating, and pleads for their classification as an essential industry. Now that the War Industries Board has announced its decision to place gold mining on the essential list, one important step has been taken toward the relief of the industry, and it remains to secure the financial assistance that will be necessary to cause the resumption of work by low-grade mines that have been forced to suspend operations on account of high operating costs, and to stimulate production from all mines.

Mr. McAdoo has stated that at no time has this country so much required the largest production of gold as at present, and that the reason for this requirement is to sustain the credit of the Government. In other words, he stated that the demand for gold is greater than ever before, and that it is needed in the financial operations of the country. Its value to the Government with respect to credit has increased, but its price has remained stationary. Its value to the Government is greater than its price of $20.67 per ounce, in that it has the additional value, greater now than ever before, that an ounce of gold in the U. S. Treasury will sustain the Government's credit for more than $20.67. It is this additional value that will justify the Government in paying a bounty for the production of gold.

There are two conceivable ways in which the Government can stimulate the production of gold: It can go into the business of prospecting and mining and produce the gold itself. The success of this method would be very doubtful, and it can be predicted with certainty that gold produced in this way would cost the Government more than $20.67 per ounce. The alternative is to pay miners $20.67 per ounce for gold produced, and in addition to this allow a specified amount toward the expense of producing it. This would be a bounty for the finding and winning of gold, and not an increase in its price, and such a bounty should be restricted to gold produced currently from mines in the United States. In my opinion, the payment of a bounty would be far more effective than the mining of gold directly by the Government.

The suggestion that certain privileges, such as exemption from taxes, be granted gold mines in place of a bounty, has the defect that it would not help the small producer or the one that produces gold at a small margin of profit, in the same proportion that it would help the larger, more successful, producer; whereas, as far as the Government is concerned, gold won at no profit to the producer is fully as useful in the Treasury as gold produced at a big profit. If a bounty is placed on gold, much of the increase in production would probably be made by small producers and prospectors from small or low-grade veins, and placers, that cannot be profitably worked under present conditions. The exemption from taxes would be of very little help in stimulating production from this class of deposits. By placing a bounty on the production of gold, the additional cost to the Government would be in proportion to the results obtained, and would be divided among producers in a like ratio.

There are precedents for the payment of a bounty or bonus of this nature. The bounty on coyote scalps comes most readily to mind. The killing of predatory animals is beneficial to the State, and the skins sell at a good price, but in addition to this, several States pay bounties in order to accelerate their extermination. The subsidizing of shipping, and of the exportation of manufactured articles, as applied in some countries, are instances of a somewhat similar practice. Even the payment of interest is in some degree of this nature, for, where we pay money for the use of borrowed money in order to facilitate our financial transactions, the Government would be paying money to get the use of gold to facilitate its financial transactions. In paying a bounty for the production of gold, the Government would simply be subsidizing the gold industry in order to keep it alive, and to maintain the production of an essential commodity.

Whatever help is given to gold mining at this time must be in the nature of additional payment, either directly or indirectly, for gold produced. Whether gold production can be stimulated indefinitely in this way without impairing our financial structure, would require a closer analysis in the light of economic and financial science than I am prepared to give; but as I see it now, the effect of paying a bounty would be simply to reduce by that much the additional credit that could be erected upon the gold produced under this plan. This might prove eventually to be a waste of credit, but as a war measure it would be no more wasteful than shooting expensive shell at the enemy. It would be an expense rather than a waste.

My suggestion as to the way in which the bounty plan

could be applied is, that the gold would be sold to the Mint at $20.67 per ounce; that the Mint would pay for it as usual, and at the same time give a receipt for the gold; that upon the presentation of the receipt together with proof that the gold was produced from domestic ore by the seller, the U. S. Treasury would pay the bounty. As to the amount of the bounty, it might well be $10 per ounce.

J. A. BURGESS.

Oatman, Arizona, July 26.

The Editor:

Sir—I would like to call your attention to the following views regarding the mining industry in Colorado. I am told by parties, in a position to know, that most of the other gold and silver mining States are in pretty much the same shape. About all the average mining man has left now is an optimistic hope for the future. The present is certainly the darkest period through which the mining industry has ever had to pass, and the general public doesn't realize it. Slowly but surely economic conditions, plus the War, have strangled all but the larger operators. Colorado is essentially a mining State of small operators depending on gold, silver, lead, zinc, and only to a minor degree upon copper as a basis for the industry. Gilpin, Boulder, and Clear Creek counties, Cripple Creek, and the districts of Rico, La Plata, Ouray, Red Mountain, and Silverton in the San Juan are producing less than ever before. I have just returned from a month's trip, and I venture to make the statement that if production continues for the next six months as it has during the past four months, Colorado will not produce more than 70% as much as it did last year, and last year its mineral production fell off nearly $8,000,000 in spite of the so-called high prices for metals.

I have talked to a great many of the smaller operators throughout the State, and they are all discouraged. A good many have quit mining and many more tell me that unless conditions change soon, they will be forced to do so. Very few have made any money during the past two years. Many have kept going, as they felt they were rendering the country some service, and were in hopes that conditions would so change that they could stay with the game and break even.

Prices received now for metals seem relatively high when compared to those received in 1912, '13, and '14, but when labor efficiency, cost of supplies, freight-rates, and added taxes of this year are compared with figures for preceding years, it is seen that all the advantage lay with the prices then obtaining. Even then the miner was not making money, and there was but small encouragement for others to become interested in the industry. Certain it is that the little fellow, who in the past has developed the prospects into mines or to the stage where they might be attractive to the larger mining corporation, has been and is being crowded out. The prospector is almost a thing of the past.

This condition has not been caused by the War. It has been taking place for a number of years, and war conditions only accelerated it. Many explanations have, from time to time, been advanced to explain it, but the fundamental reason is that small-scale mining does not pay enough to attract new capital. Therefore, if the industry is to continue, the average price of metals must be higher than in the past. The plain truth of the matter is that for many years the average mining man of this State (I think the same is true of others) has sold his product for less than it cost to produce it. It is true that the larger mining corporations can make a profit (and have) at a lower price than the small operator, and that they also produce about 70% of the metals; they also have been the deciding factor in making the metal quotations, but as I see it at this time, this has no bearing on the small operator.

The large mining corporation never has been successful, and probably never will, in the development of properties from the prospective to the productive stage. There is too much inherent risk in this part of the work to make it attractive to them, but it is on this part of the industry that the future of mining depends, and in some way conditions must be so changed as to make a larger percentage of it profitable, thus removing some of the risk. It is obvious that this is the part of the industry that must be encouraged and stimulated.

The whole of the matter, in my opinion, resolves itself into this: Assuming that the larger mining corporations produce 70% of all the metals and the smaller operators 30%, if the quantity of metals produced by the larger companies is not sufficient to meet the demands of the market and Government, at this time, then the prices must be so adjusted that the men who produce the 30% can at least have a chance to break even, and this is something they have not now. It seems to me that, at this time, in order to have a plentiful supply of metals, the Government can well afford to advance metal prices to a point where the individual producer can make a profit so that he can stay with the game. The idea is not new. It has been advocated before, and objected to principally upon the ground that it would only enable the larger corporations to increase their profits to an unreasonable extent. Well, what if it does, so long as their excess profit can be taken away and turned back to the Government through income and excess-profit taxes? What's the difference how much they make when they don't keep it? This idea is being applied to the coal industry. The small operator is kept alive during a critical period. Why not apply it to the metal-mining industry?

I believe that the time is in sight when the ratio of the value of metals in metallic money will be the same all over the world. That is, some world-standard coin containing so many grains of gold or silver must be the standard for the whole world and be recognized as legal tender in every civilized country, so as to simplify and stabilize the world's business, and that such coin will have a higher value per grain of gold or silver than any coin has now.

Objection has been made to advancing the value of gold and silver on the score that this action would upset financial conditions all over the world. Is it not a fact that conditions are already upset, financial more than all others? Investigate the rates of exchange. Is it not also a fact that the people of the world must adjust themselves to the conditions of the times, and that while they are in the mood to make this adjustment is the time to make it? Certainly no one can deny the fact that we are adjusting ourselves to conditions undreamed of a year ago and we are doing it without complaint.

Formulas for Mine-Valuation

The Editor:

Sir—In your issue of June 29, K. F. Hoffmann disapproves of the formula which was developed and proposed to be employed in the valuation of expected mine dividends as given in my article in the Mining and Scientific Press of May 18. He states that, according to the definition of a 10% investment (the rate that I assumed in my examples) the Hoskold formula is not in error; but, as I stated in my paper, it is not sufficient to define a 10% investment in a wasting asset, such as a mine, as one that will pay the investor 10% per annum on his investment and return him his capital at the end of the period of the investment, for there are not one or two but several ways in which the dividend may be apportioned between interest and amortization of the investment that will fit Mr. Hoffmann's definition. According to the formula employed there is a large difference between the various values that may be thus obtained. Obviously some addition to his definition is required before an exact solution can be reached, and according to my view 10% interest should be paid only on the unreturned capital, and the amount of the unreturned capital is the amount originally invested less the amount in the sinking fund.

According to my definition and the formula deduced therefrom, the present value of an annual dividend of $1000 for the term of 10 years, paying 10% per annum on the investment, with the sinking fund accumulated at the rate of 4%, is $6591.37. By the Hoskold formula the value of this investment is $5455.81. Further, we may regard the dividends as payments on an installment-loan by which each dividend pays the investor 10% on the investment, with an additional amount, which annually reduces the principal in each year 10%, being paid on the reduced principal. This gives a value for the investment of $6144.57. This is a common transaction by which banks loan money, and corresponds to accumulating the sinking fund without interest to the amount of the original investment, and requiring the mine to pay interest only upon the unreturned capital; or we may regard each dividend of $1000 as a separate investment, each dividend having a present value at 10%, according to the number of years its payment is deferred, under which hypothesis the value of the example taken is likewise $6144.57. (See Hoskold, p. 75, for table of factors.)

We may require the mine to pay 10% interest on the original investment during the term of 10 years, and return the investment in full without the aid of 4% interest on the sinking-fund; by which a value of $5000 is obtained. We may require the mine to pay 10% interest only on the capital unreturned, providing that the unreturned capital is the original investment less the actual amount paid into the sinking-fund without interest accumulations, and require the sinking-fund with 4% interest to amount to the original investment at the end of the term. This gives a value of $6498.39.

Here are six ways, giving five different results, in which the dividend of $1000 per annum for 10 years can be regarded as paying 10% interest on the capital and returning the capital to the investor, all of which agree with Mr. Hoffmann's definition. There are several others which are not illogical. Obviously this definition is not exact; and I believe the additions I gave to this definition in my original article make it exact and allow of a correct solution, and that I have further shown that the Hoskold formula does not give the correct solution.

In the conclusion of Mr. Hoffmann's letter he states that an investor in mines should be allowed more than the ordinary rate of interest common to bonds, otherwise the investor would buy bonds and avoid the risk necessarily taken in mining stocks. To this I agree, but I do not see that it can be taken as an argument for the use of the Hoskold formula rather than another, but I cannot agree with him if he intends to argue that the Hoskold formula should be employed because it gives a result lower than the correct one, and that the difference should be allowed the investor as a premium or bonus, because under my view the formula employed should be theoretically correct. A premium or bonus may be justified, but an investor should be told the amount or rate of the expected bonus, rather than have it concealed by faulty mathematics.

It would appear probable, when it became recognized that a mine was a wasting asset and, therefore, that provision should be made for the return of the capital to the investor, that, without close mathematical analysis, engineers had merely turned to the formulas employed for bond valuation in which but a single type of sinking-fund is ordinarily used. However, on close analysis, it appears that an investment in a bond is not exactly parallel with an investment in a mining stock, nor is an investment in an installment-loan. The mathematical valuation of a mine investment differs from that of nearly all other investments, and it should be so recognized.

CALUMET & ARIZONA BLAST-FURNACE; END ELEVATION AND CROSS-SECTION

SMELTING PLANT OF THE CALUMET & ARIZONA MINING CO., AT DOUGLAS, ARIZONA

The Calumet & Arizona Smelter

By COURTENAY DE KALB

The smelter of the Calumet & Arizona Mining Co. is not a custom plant, yet the exigencies of fluxing and of the development of other enterprises have led to an extension of its zone of attraction as far as to Lordsburg, New Mexico, in an easterly direction, to Ajo in the west and to Jerome in the north. The higher grade New Cornelia ore, which is very silicious, contains approximately 4% copper, present mainly as carbonate and silicate, and this is used as reverberatory fettling and as a flux for the converter charges. The daily consmuption of this material is 150 tons. An equal quantity of a similar ore from the 85 Mining Co. at Lordsburg is used for the same purpose. The main supply of ore, however, is from the company's great mines at Bisbee, or, more specifically, at Warren, 25 miles to the northwest. The daily deliveries from this source nominally amount to about 2400 tons, averaging about 5% copper, 18% silica, and 28% sulphur. The Shattuck mine above Bisbee, of which it may be said with more truth than fiction that half-hearted commendation given by economic geologists and engineers, with consequent hesitation on the part of possible buyers, forced the owner to develop the property himself and to scramble through hard times to financial affluence, contributes 500 tons per diem of sulphide ore assaying 5% copper. In September, at the time of my visit, the smelter was treating about 1500 tons of ore daily, which is less than half its capacity. This deficiency of ore was due to the shortage of labor at the mines. The labor-problem, however, does not now embarrass operations as it did at the time when the pro-German propaganda was concentrated so strongly upon producing disaffection in the ranks of the miners. The Calumet & Arizona ore is variable in character, as are all the other ores of the Warren district. In depth there is an abundance of sulphide ore; there are also large bodies of carbonate and other oxidized ores, sometimes not conformable to the usual and supposedly logical position of oxidized ore above the sulphides; in places that order is reversed at Warren and at Bisbee. This explanation will serve to accentuate the fact that deliveries of mixed high-copper ores of both classes are made to the smelter. The ratio between them is about 1 of oxide-ore to 2.5 of sulphide. The thing, however, that it does not reveal is the interesting fact that, in the development of the large reserves of high-grade ore, that is, ore containing over 5% copper, a much greater tonnage of low-grade sulphide ore has been put into sight. For such ore there is an extremely limited market at present, although its composition is favorable for the manufacture of sulphuric acid. The sulphur content exceeds 45%, and it assays about 2% in copper. The Calumet & Arizona smelter is one of the few Western plants that has a sulphuric-acid annex. This has a capacity of 200 tons of acid per day, and if it be essential for purposes of war to produce more of this commodity it is plain that it would be advantageous to enlarge a going plant, where there would be no extra over-head expense, and but little extra labor-cost. It would be possible, under properly co-ordinated transportation systems, to take acid from such a plant to Mississippi Valley points, if not farther east, at least to the extent involved in the duplication of the Calumet & Arizona works. With lead at moderate prices, this would seem to be a favorable moment to undertake such a duplication if required as an

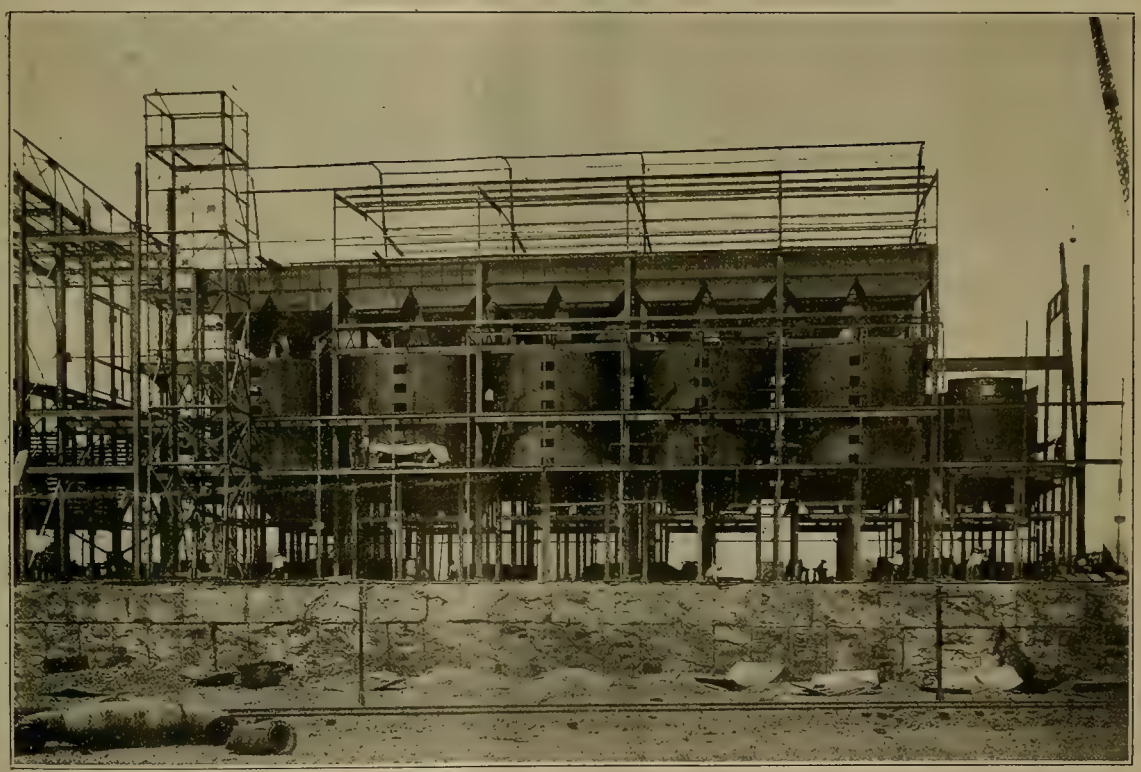
emergency measure. It is interesting to note that the plant now has a large battery of Herreshoff roasters, of which nineteen are discharging their sulphurous fume into the atmosphere, while only five are connected to the acid-making plant; therefore no delay would be occasioned for the manufacture and erection of this part of the plant. Neither would it be necessary to draw upon the low-copper pyritic ore, which would still remain cheaply available for acid-making in the East if the Government can arrange for its transportation. Too much stress cannot be laid upon the fact that, while officials in Washington are calling for more pyrite and more sulphur to make good the deficiency of Spanish pyrite, here are resources almost untouched, that need no more than suitable management of the transport-system of the country to become available for the general good.

The Douglas smelter of the Calumet & Arizona company lies about a half mile north-northwest from the Copper Queen smelter of the Phelps-Dodge Corporation. It represents a completely re-built plant, new from end to end, replacing the old works erected some years ago. The designing was done by the Calumet & Arizona staff under the immediate care of A. G. McGregor and C. H. Repath, with the advice and assistance of L. D. Ricketts, bringing his ripe experience to the problem as consulting engineer, and under the energetic direction of the general manager, Captain, now Major, John Greenway, to whom each enterprise in the betterment and development of the plants of his company becomes a pet on which he bestows an enthusiasm that imparts inspiration to his associates. The plant as it stands today contains receiving bins having a total capacity of 10,000 tons, a belt-conveying system for the same capacity per diem, a crushing, screening, and automatic sampling-plant of the most approved design, a bedding-yard operated on the Messiter-system, which first attracted well-deserved attention some ten years ago at Cananea, a great coke-handling and storage department for 10,000 tons, a battery of 24 Herreshoff roasting furnaces, as automatic in the feeding of ore, the discharging of calcine, and its conveyance to the reverberatories as such a plant can be; four 20 by 100-ft. oil-fired reverberatories, and two blast-furnaces of the Mathewson type, 40 ft. long by 4 ft. wide at the tuyere-section; also a converter department having six converter-stands, a McGregor skull-breaker, casting-machine, and the other accessories pertaining to a smelter. The power-house, as is characteristic of every plant upon which Dr. Ricketts lays his hand, is a model of efficiency, with no modern device omitted for ensuring the highest degree of economy. The steam is derived entirely from the reverberatory waste-heat boilers, and as there is a surplus of power over that needed for the smelter, this is transmitted as high-tension current for use in the mines at Warren. The power is developed with turbine alternating-current generators, taking steam at 80 lb. pressure, superheated by 60°. These turbine engines generate 3000 kw. at 80% power-factor, and 480 volts. Four No. 10 Connersville blowers are also direct-connected to steam turbines developing 240 hp. each. These furnish air for the blast-furnaces. In addition there are three Nordberg blowers having capacities in free air per minute respectively of 10,000, 12,000, and 15,000 cu. ft. These supply the converters, two turbines, three pumps, three Ingersoll-Rand compressors, and some minor apparatus. The machine-shop is adequate for all repairs to a plant of this magnitude. Fuel-oil coming by train from California is pumped to five well-protected storage-tanks having a capacity of 10,000 bbl. each. From these it is pumped, according to proper methods of safety-supply, to a measuring-tank for general distribution throughout the works where needed. The water-supply is abundant, the great Sulphur Springs valley being filled with desert 'wash' that is saturated by the precipitation from a large mountainous water-shed, so that two wells, 350 ft. deep, suffice for the needs of the entire plant. This water contains a large amount of sodium carbonate in solution, so that it is excessively 'soft' and deposits no scale in the boilers.

The steel ore-bins, 24 in number, are 37 ft. high, and the ore is delivered to them in 50-ton side-dump cars that are drawn on a 1½% grade from a spur of the El Paso & Southwestern railway. The width of the bins is 24 ft., and it will be seen from the plan that they are long and narrow, facilitating a side-discharge at the bottom, where the ore is delivered through arc-gates and fed by a traveling roller-feed hopper-car to either of two 30-in. conveyor-belts. These carry their burden to a feed-hopper placed between two 24 by 36 in. Blake crushers set front to front, having a capacity of 100 tons per hour each, crushing to 4-inch size. They were made by Chalmers & Williams. The crushers are cross-connected by chutes, are provided with grizzlies, and deliver the ore to a pair of 20-in. conveyor-belts that take it to the top of the sampling and screening-plant. A new set of bins has just been installed parallel to the older series, and a No. 8 gyratory, built by the Allis-Chalmers Manufacturing Co., has been erected at the end of the line of bins. The crushed ore from this machine will be handled by a new unit of the sampling-works. This addition to the mill is at present only equipped for handling the samples as they are cut from the main stream of reject, and for screening sulphides, the coarser sulphide being sent to the mixing-beds for the blast-furnaces, while the remainder is brought down to approximately ½-in. size for the reverberatory furnaces. The sulphides go to the Herreshoff furnaces to be roasted, and the oxide ores go direct to the charging-bins.

The handling of the ore through the mill is on a 2-belt system, each belt being capable of carrying the entire product of each unit. The arrangement is in parallel, so that no delay can ever occur on account of needed repairs. The 4-in. ore from the primary crushers is first delivered to a pair of Snyder samplers, consisting of a shallow cone, like a bowl set on edge, the ore-chute delivering to the lower inside rim, which is protected by renewable cast-iron liners. At one point in the rim is an open segment the width of the ore-chute. The bowl revolves, and during nine-tenths of the revolution the

JUNCTION SHAFT OF CALUMET & ARIZONA MINING CO., BISBEE, ARIZONA



*BATTERY OF HERRESHOFF ROASTING-FURNACES IN PROCESS OF CONSTRUCTION AT C. & A. SMELTER

*[This illustration appeared in connection with an article on the Calumet & Arizona sulphuric-acid plant in our issue of March 30, 1918, and by an error in publication was wrongly said to represent the Hegeler roasting-furnace.—Editor.]

machine is discharging reject to the main ore-stream, while for the remaining one-tenth of the revolution the whole stream is diverted to the sampling-unit of the mill. The Snyder sampler, which is excessively simple and efficient, cuts one-tenth of the stream, and by successive reductions the entire volume of 2400 tons per day is accurately sampled, each variety of ore being separately treated, and for every 100 tons there results a sample of 160 lb., which is sent to the bucking-room. It is reduced there to a proper size for the assay office by the usual series of gyratories, coffee-mill crushers, and disc-grinders. Although every ton of ore entering the smelter passes through the mill and is sampled, there is a by-pass after the first sampler, by means of which ore suitable for bedding can go direct to the beds. The coarser crushing is done by four 10 by 20-in. Blake crushers made by the Power & Mining Machinery Co. The final reduction of the ore to ½-in. size is effected in two Symons vertical disc-crushers, each of which has a capacity of 50 tons per hour. Throughout the plant trommels are used for screening.

From the sampling-works conveyor-belts take the coarse ore to the Messiter beds, the fine silicious ore to bins in the reverberatory department, the fine sulphide ore to the roasters, while the calcine from the roasters is transported by electrically-operated trains of larries to the reverberatory charging-bins. The roasting practice has been dwelt upon in a previous article describing the sulphuric-acid plant.[1] The furnace used is the latest design of the Herreshoff, built by the Pacific Foundry Co., of San Francisco. Each furnace has six hearths, exclusive of the drying-pan, 20 ft. 2 in. inside diameter, and 21 ft. 7¼ in. over all. It may be well to recall the fact that, of the 24 Herreshoff furnaces, only 5 are running 'closed,' that is, with the gas-discharge muffled by being sent through flues into the dust-chamber and thence through the nitre-house, Glover tower, and acid-chambers. The remaining 19 are running 'open,' the gases, which carry from 1 to 1.8% of the weight of the charge, passing through a dust-chamber 140 ft. long and 60 by 29½ ft. in vertical section, on their way to the stack. The walls of the dust-chamber are built of hollow tile. A baffle-wall is placed near the front and the rear of the chamber. The ore for roasting does not need to be reduced to ½ in., since disintegration on the hearths brings it down to proper size. About 25 to 30% of the ore for the 'open' furnace will remain on a ½-in. screen. In the ore roasted in the 'closed' furnaces the sulphur content is maintained a little higher, although the difference usually does not exceed 3 to 5%. The average is about 29% sulphur. Owing to the coarseness of the material a considerable amount of 'kernel-roasting' is done. The calcine issues from the 'open' furnaces with about 10% sulphur as against 13% from those connected to the acid-plant. The capacities of the 'open' and the 'closed' furnaces are respectively 90 and 70 tons each per diem, although the 'open' furnaces can be driven to the extent of handling 125 tons. An official statement by the company gives the average dry tonnage roasted as 96.4 per day, requiring 66,000 cu. ft. of air per minute, producing 80.5 tons of calcine and dust, volatilizing 70.1% of the sulphur, and giving 2.64% of flue-dust recovered. The typical analysis is as follows:

Roasting-Furnace Materials

	Charge. %	Calcine. %	Dust. %
Silica	16.6	18.1	16.5
Alumina	2.9	3.5	5.6
Iron (Fe)	31.7	38.2	28.7
Lime (CaO)	1.6	1.9	2.3
Sulphur	29.6	9.9	10.7
Copper	4.67	6.12	6.54

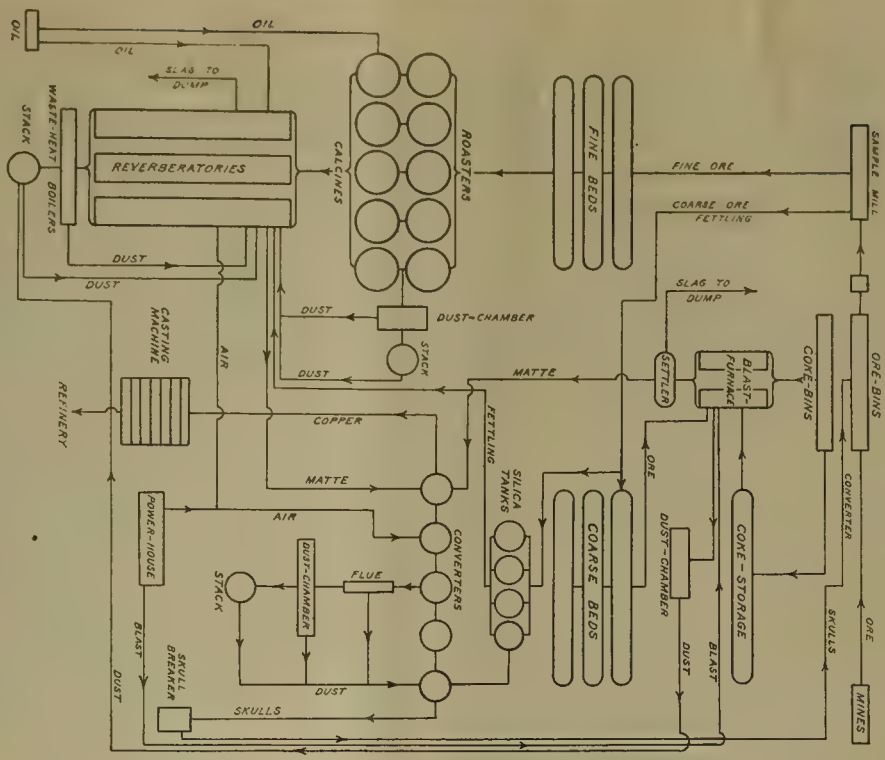
The official figures regarding the blast-furnaces are also given. As previously stated, there are two furnaces of the long pattern first developed in practice by E. P. Matthewson, though it had long been pointed out by metallurgists that there was no necessary limit to the length of a rectangular furnace for copper smelting. At the Calumet & Arizona plant they are 40 ft. long by 48 in. wide at the tuyeres. There are 64 tuyeres, 4½ in. diam., and the elevation from the tuyere-line to the feed-floor is 16 ft. 4½ in. Exclusive of coke, the charge fed per furnace amounts to 996 tons per day, requiring 44,169 cu. ft. of free air per minute, equivalent to 68,645 cu. ft. per dry ton, the blast being supplied at a pressure of 27 oz. The coke used is 12.7% and the dry tons of ore on the charge amounts to 89.7%. The flue-dust produced is 3.4% of the total dry charge. The accompanying full-page drawing gives the details of construction of these big furnaces, showing exterior and interior fittings, fire-hearth, matte-launder to converter-ladle, and, on the opposite side the high-level slag-discharge from the fore-hearth, and the position of the slag-pot. It is a model of excellent design.

Analyses of Blast-Furnace Products

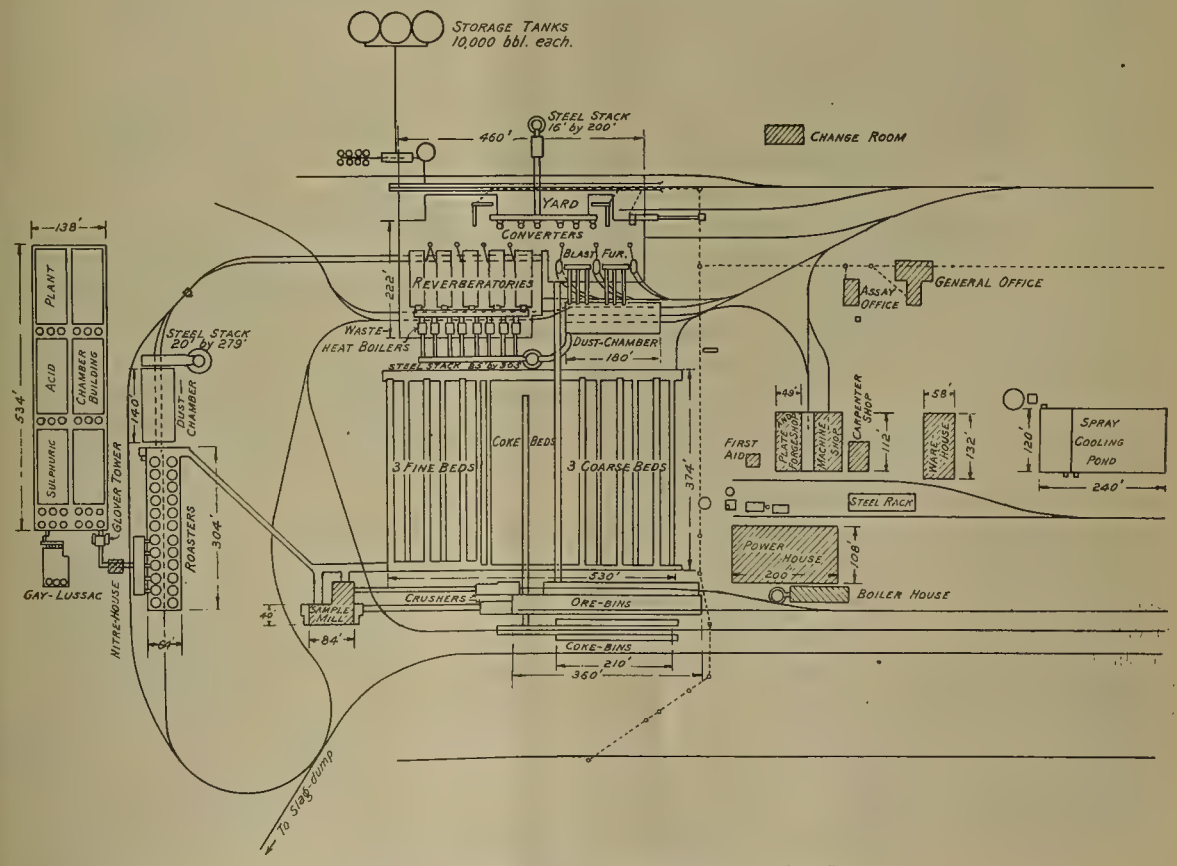
	Charge average. %	Slag average. %	Matte average. %	Flue-dust average. %
Silica	22.2	35.3	...	20.9
Alumina	5.3	9.4	...	8.0
Iron (Fe)	25.9	...	40.0	28.6
Iron (FeO)	...	37.8	...	...
Lime (CaO)	5.9	9.0	...	2.4
Sulphur	13.1	...	25.3	9.1
Copper	5.29	0.41	28.81	5.0
Zinc oxide	...	...	...	...
Manganese oxide (MnO)	...	...	...	...
Magnesia (MgO)	...	...	...	...

Another drawing shows in detail the construction of the reverberatory furnaces, which likewise are examples of the best modern practice. There are four of these, all being 100 ft. long, and 19 ft. wide. It will be seen that the furnace is erected upon a deep foundation of poured slag. On this comes a 4-in. layer of tamped fire-clay, followed by 12 in. of crushed quartz under the matte-bay, and 21 in. under the remainder of the furnace-hearth, the matte-bay being 20 ft. long. The 21-in. I-beams, to take up the thrust at the rear of the furnace, are anchored securely by 2-in. rods with 10-in. plates at the end, laid in the poured slag. The expansion-joints, which are three in number, and are spaced about 18 ft. centre to centre, are breaks in the arch 7 in. wide at the key-line, and tapering to a fraction of an inch at the walls. There are 42 fettle-holes on each side. 6 by 6 inches in size, and spaced 2 ft. apart from centre

[1] M. & S. P., March 30, 1918.



FLOW-DIAGRAM OF CALUMET & ARIZONA SMELTER



PLAN OF CALUMET & ARIZONA SMELTER AND YARDS

to centre, open through the arch close to the inner wall. The advantages of fettle-feeding, with details, have already been discussed in connection with the smelting practice at the plant of the Kansas City Smelting & Refining Co., at El Paso, in the MINING AND SCIENTIFIC PRESS of May 25, 1918. The protection given to the walls is better than when fettling is employed in the old way, and the limits of the bath are more flexible. Thus a better adjustment to smelting conditions is possible than when the bath is held to rigid lines.

The matte-bay is an interesting detail, especially with regard to the expansion of the bath when side-charging is employed. It hints at conditions not unlike those that would obtain by the enclosure of what is essentially a fore-hearth within the reverberatory itself. This has been the subject of direct experiment elsewhere. The outcome of those experiments will be watched with interest. The object is to grade the matte, and to permit of a continuous discharge of slag, from which the matte may be settled more perfectly than under the old system. One problem, however, is the invariability of the arch-temperature. Periodic cooling, at the times of slag-skimming and of charging, tend to prolong the life of the arch. Indeed, in side-charging much of that advantage is sacrificed, and even the feed generally contributes heat since the custom prevails, at most plants where side-charging is practised, of bringing the calcine from the roasting-furnaces to the reverberatories as hot as possible. The idea of including the settler within the furnace suggests the probability of greater fuel-economy. It must be understood that the reference here is merely to the tendency of the bath to widen, forming a conspicuous embayment, as was explained more fully in discussing the reverberatory practice at the El Paso smelter. At Great Falls a fore-hearth is applied to the reverberatory, placed outside as is done at blast-furnaces; this gives nearly the same advantage in restricting heat-losses. With side-charging a much more uniform state of the bath can be maintained, as there is no periodic disturbance from drawing down and adding charges of fresh ore. Side-charging naturally suggests taking fuller advantage of the possibility of uninterrupted smelting, and that leads to a consideration of the benefits that may accrue from a continuous discharge of the products of fusion. There is probably no great difference between the total heat-loss in the two methods. It will be interesting, when sufficient definite figures from a number of plants become available for the purpose, to work out the balance of cost between the two systems, taking into account the smelting capacity per campaign, giving proper credit for the larger heat recovery per unit of copper produced by side-charging. At the Calumet & Arizona the charge going to the reverberatories is cold, consisting of silicious ores. As the reverberatories are now operated at this plant high-sulphur ore is used as a cleaner preparatory to skimming. It has been proposed by some metallurgists to employ super-heating at the slag-end of the furnace before skimming, for which purpose auxiliary burners on the side would be requisite.

At the time of my visit each of the furnaces in the plant was treating 400 tons per day, exclusive of converter-slag, but recent changes have increased this to 700 tons. At El Paso also the smelting capacity was greatly augmented without altering the structural details of the furnace. This increase in smelting capacity is the result of a more perfect combustion of the fuel-oil close to the firing-end, which in turn limits the smelting-zone to approximately the same limits. The charging accordingly is not carried so far toward the front of the furnace, leaving the remainder of the hearth to constitute a pool in which the matte separates more perfectly from the slag. The distribution of heat under this system is as satisfactory as under the old system where a longer flame was used, and the more perfect combustion results in securing the requisite heat with a reduced quantity of fuel. The advantage is conspicuous when firing is done with oil, but it appears to be even greater when powdered coal is employed.

The converter-slag returned to the reverberatories, at the Calumet & Arizona plant, averages about 500 tons per day; it is poured into the furnaces in a molten condition and assays about 3.25% copper.

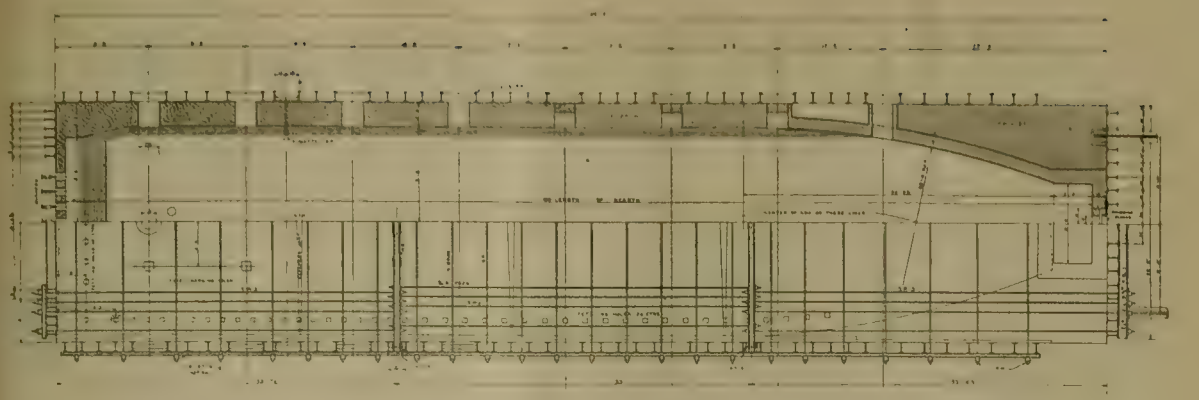
The copper in the reverberatory charge is from 5.16 to 5.40%. The following analyses of the products are characteristic:

Reverberatory Products

	Solid charge		Slag, including converter slag		Matte	
	1	2	1	2	1	2
	%	%	%	%	%	%
Silica	28.3	28.0	34.6	34.7	...	0.8
Alumina	4.1	4.0	6.0	5.8	...	...
Iron (Fe)	29.3	28.8	...	...	41.2	41.2
Iron (FeO)	...	...	47.5	47.9	...	...
Lime (CaO)	3.0	3.0	3.7	3.8	...	...
Sulphur	8.5	8.8	...	...	26.1	25.7
Copper	5.16	5.4	0.39	0.40	25.03	25.3
Zinc oxide	...	...	...	1.4	...	...
Manganese oxide (MnO)	...	...	...	1.4	...	...
Magnesia (MgO)	...	...	...	1.3	...	...

The official statement of the company gives the consumption of fuel-oil per ton of total charge as 0.752 bbl. Steam recovered from the waste-heat returns a credit to the reverberatory of 0.298 bbl. per ton of charge, leaving 0.454 chargeable exclusively to smelting. These figures have been reduced to an average of 0.719 bbl. of oil burned per ton of total charge; a steam-credit of 0.303, and a net consumption, chargeable against the ore smelted, of 0.416 bbl. A Californian asphalt-base oil, of 23° Baumé, having a heating value of 19,000 B.t.u., is used. The elimination of sulphur from the charge by volatilization during smelting is about 27% of the total in the ore fed. The reverberatories and the blast-furnaces are at the opposite ends of the same structure, and are parallel to the converter building, so that the matte from both is delivered into ladles within the adjacent converter-plant, and within reach of the cranes.

There are six converter-stands, mounting 12-ft. basic-lined converters of the Great Falls type. Two extra shells are kept on hand to facilitate repairs. The silica is fed into the converters through pipes leading from overhead bins. The matte is blown to blister containing on an average 99.15% copper. It is cast into ingots of 300 lb. each, being poured from 160 cu. ft. cast-steel ladles into



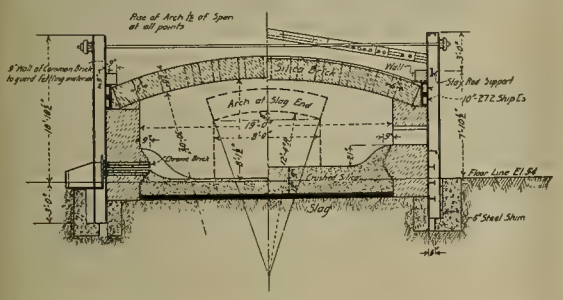
CALUMET & ARIZONA 19 BY 100-FT. REVERBERATORY FURNACE; ONE-HALF PLAN-SECTION

molds in a straight-line casting machine. The ingots are shipped to the Nichols Copper Co. at Laurel Hill, New York. The converter-scrap is handled back to the converters, with the exception of the skulls. These are broken in a McGregor skull-breaker, and are then sent to the blast-furnace beds. The amount of broken skulls is about 150 tons per day, and assays 10% copper. The company's published statement of converter products gives the following analyses as typical:

Converter Products

	Silicious flux, %	Converter slag, %	Bullion, %
Silica	72.7	16.7	...
Alumina	5.4	2.1	...
Iron (Fe)	5.8	...	...
Iron (FeO)	...	70.6	...
Lime (CaO)	0.1	...	...
Sulphur	2.9	...	...
Copper	4.58	2.79	99.16

The roaster stack is separate from all others. It is 20 ft. diam. and 279 ft. high. The dust recovered in the roaster dust-chamber amounts to 22 tons daily and con-



CROSS-SECTION, CALUMET & ARIZONA REVERBERATORY

tains about 5.6% copper, 0.3% lead, 3.3% zinc, 3 oz. silver, and 0.06 oz. gold per ton. From the dust-chamber in the flow-line of the acid-plant two tons per day of a similar product are collected. The converter gases, amounting to 240,000 cu. ft. per minute, show a moderate stack-loss in dust containing approximately 15% copper, 34% lead, 9.5% zinc, with 11.5 oz. silver and 0.086 oz. gold per ton. It is probable that a Cottrell treater will be installed to recover this dust. The general superintendent of the Calumet & Arizona smelter is H. A. Clark, and the metallurgist in charge of smelting operations is Carl H. Cole.

WOLFRAM ore is being mined in the districts of Haifeng, Lufeng, P'u-ning, Kityang, and Wuhua, China, according to a Consular Report. At first it was found in small quantities on the surface, but recently its existence in vein deposits has been proved. The Wuhua district (old name Changlok) appears to contain the largest deposits. A group of villages about Tung-ling-hsia, among which are Chiu-lung and Ho-tung, is the principal centre of production. This area is said to cover 6 or 7 square miles, and it is here that the ore is found in large veins, being associated with quartz crystals. It is claimed that over 2000 booths have been erected as shelter for the people who have flocked there in search of 'black gold,' as it is called by the natives. This area is 50 miles north from Hopo, the head of small-craft navigation in the Kityang river. Other centres of production are Hei-lin in the Wuhua district and Tai-yong in the Kityang district. A large market for wolfram is Waichow, and there is little doubt that much of the ore mined in this district reaches that place. With the development of the Wuhua and Kityang districts, Swatow's importance as a market increases, as it is the natural port of these districts.

MAGNESIUM as a fertilizer is described by F. Masino in the 'Giorn. Farm. Chim.' No. 65, 1916. Comparing the growth of two lots of wheat, the same number of seeds being sown in each case, one plot being watered with a 5 : 1000 $MgSO_4$ solution, and ordinary water being used for the other, the soil that received the $MgSO_4$ solution remained more moist than the one receiving the ordinary water; the plants of the lot watered with $MgSO_4$ solution were also higher, stockier, and more vigorous than those of the second lot and bore a larger number of matured seed-heads. Ordinary vetch gave the same results. The use of magnesium increased the amount of chlorophyll, which in turn resulted in an increased growth of plant-tissues and the synthesis of organic compounds necessary for plant life.

The Menace to Gold Mining

The following statement was prepared by Charles G. Yale, for the California Metal Producers Association, on July 16, as a memorandum for the use of Raymond T. Baker, Director of the U. S. Mint.

What the gold miners of California strongly desire is co-ordination of the different Federal departments, with relation to the mining of gold during the War. They wish this gold-mining industry to be officially declared an essential one so that these departments may work together. Under the present circumstances it is virtually considered non-essential, which has resulted in unfortunate conditions.

The uncertainty of the attitude of the Government regarding gold mining is a factor causing much unrest at the present time; with fixed conditions, renewed efforts to keep the mines productive would be put in force. The absolute determination of this point is necessary. If these gold mines were compelled to close down, as appears likely under present conditions, they could not be brought up to full productive force within five years, which would reduce gold stocks of domestic production fully fifty million dollars during that period in California alone.

The present conditions of the unusual decadence of gold mining in California started when the Californian electric and water-power companies recommended to the State Railroad Commission a priority list placing quartz-gold mining and dredge mining No. 38 and 39 in a list of 45. Yet it was admitted by the power companies that the maximum station demand was 15,000 hp. for gold dredging, and 9000 hp. for quartz mines. This matter has not yet been determined, but is of public notoriety, badly damaging the gold-mining interests.

The next detrimental step was when the general classification list of the Priorities Board was issued as to steel commodities and hardware when gold mining was ignored as essential. The larger hardware companies of the State, in their business notices to their traveling men, issued the following: "Mining companies are also included with the exception of gold mines, which we understand at the present time are classed as non-essential, although we believe there will be a revision of this classification later."

The result of this statement, passed about in the mining centres of the State, was to lead miners to conclude that gold mining might be ultimately closed down, so that numbers of them left for employment in more stable industries.

Moreover, it was found difficult to get in ordinary supplies for mining purposes, and steel, iron, and hardware have been especially hard to procure by the miners in the interior of the State. In one case a very large company had to wait four months for necessary steel cable for the cages in its shaft. The gold-dredges, which use large quantities of steel rope, are constantly placed under difficulties in this respect.

The War Industries Board has been appealed to several times for relief in this matter of priorities, but thus far no answer has been received from the letters.

Secretary of the Treasury McAdoo in a letter to representative Sulzer of Alaska, published in the Congressional Record of June 15, 1918, said: "I would be sorry if there were any relaxation in the effort to produce gold. At no time has the country so much required the largest possible production of gold as at present. Next to food and ammunition, gold is one of the most needed war essentials. The maintenance of gold production at the maximum point is a great necessity. The man or community that maintains or increases its production of gold in the face of difficulties and discouragement is performing a patriotic service."

Notwithstanding this direct statement there is no declaration of the Priorities Board or War Industries Board that gold mining is an essential industry.

Meantime, moreover, the Engineers' branch of the U. S. War Department is insisting on quartz miners erecting and maintaining permanent and very expensive impounding works to prevent any tailing passing into even the smallest tributaries of navigable streams. This is an additional burden, only imposed after some 65 years of mining in California, which might well be deferred until a year or more after expensive conditions at present existing.

The gold-mining industry is at present in a state of temporary decadence in California. This is due to causes having nothing whatever to do with the actual mines themselves. Numbers of gold miners have gone into the Army or Navy, and thousands of others into the working of commercial minerals, while many more have gone to work in industrial occupations, such as shipbuilding, where the emoluments are greater.

The deep or quartz mines are most materially affected, their gold output annually having fallen off 15 to 20%. The cost of skilled labor, supplies, etc., have materially increased and the purchasing power of the gold produced is much less than formerly. A great curtailment of gold-mining operations will result unless some remedy is provided.

Numerous gold mines in the State of California have been compelled to close down under present circumstances and more are following. The cost of producing an ounce of gold has increased from 50 to 75% within a year. Gold is not to be classed with utilitarian metals of commerce because it serves exclusively as the standard for monetary purposes. The Government bonds depend for their standing on our gold reserves and these should be added to from our own mines as rapidly as possible. If our gold mines are compelled to close down these reserves must be decreased.

California has been for 70 years, with a very few annual exceptions, the leading gold-producing State of the Union. Its gross output has been $1,672,681,000 to the end of 1917, which is far ahead of any other State, or group of States. It still produces over $20,000,000 a year in gold alone. Surely an industry with such an exceptional record should receive every encouragement from the Government.

Minerals Separation and Beer-Sondheimer

A CHRONOLOGY

December 30, 1903: The company known as Minerals Separation, Ltd., is registered at Somerset House, in London.

August 24, 1910: A company—also British—called Minerals Separation American Syndicate, Ltd., is registered in London to take a two-year option from Minerals Separation, Ltd.

October 10, 1910: M. S. Ltd. and M. S. A. S. Ltd. agree to organize a new corporation to acquire the patent-rights belonging to M. S. Ltd.

June 26, 1913: Accordingly, Minerals Separation American Syndicate (1913), Ltd. is organized under British law.

September 10, 1913: M. S. A. S. (1913), Ltd. agrees with the firm of Beer, Sondheimer & Co., of Frankfurt-am-Main, Germany, to appoint B. S. & Co. sole agents for M. S. A. S. (1913), Ltd. in order to exploit its patent-rights in North America. This agreement appears not to have been filed at Somerset House.

August 4, 1914: Declaration of war by Great Britain against Germany, rendering void all contracts between citizens of the two belligerent countries and therefore breaking the agency between the British company, M. S. A. S. (1913), Ltd., and the German firm of B. S. & Co. Despite this legal fact M. S. A. S. (1913), Ltd. tries as far as it can, through the New York agents of B. S. & Co., to continue its agency business in America.

August 4, 1914: Otto Frohnknecht, one of the New York agents of B. S. & Co., declares his intention to become a citizen of the United States.

October 5, 1914: Otto Frohnknecht and Benno Elkan, agents in New York for B. S. & Co., declare that they have not paid, and will not pay, to B. S. & Co. during the War any part of the commissions accruing under the agreement of 1913 between M. S. A. S. (1913), Ltd. and B. S. & Co. This agreement also was not filed at Somerset House, but it is mentioned in a later agreement, of August 4, 1916, which was filed, as British law requires, on November 3, 1916.

January 6, 1915: M. S. A. S. (1913), Ltd. appoints Benno Elkan and Otto Frohnknecht "doing business as B. S. & Co., American branch," to be its sole agents in North America.

February 15, 1915: Benno Elkan declares his intention to become a citizen of the United States.

April 5, 1915: Harry Falck, another of the New York agents of the German firm of B. S. & Co., testifies that B. S. & Co. continues to collect royalties in North America in behalf of M. S. A. S. (1913), Ltd.

August 26, 1915: Otto Frohnknecht, Benno Elkan, and Harry Falck organize the firm of Beer, Sondheimer & Company, Inc. under the laws of New York state.

July 18, 1916: The New York branch of B. S. & Co. and the New York corporation of B. S. & Co. Inc. are placed on the British black-list. Despite this action of the British government, M. S. A. S. (1913), Ltd. endeavors to help Otto Frohnknecht and Benno Elkan by making a new agreement, replacing (1) that of September 10, 1913, between M. S. A. S. (1913), Ltd. and the German firm at Frankfort, this agreement having been nullified by the outbreak of war, and (2) the later agreement, of January 6, 1915, between M. S. A. S. (1913), Ltd. and the New York agents (Otto Frohnknecht and Benno Elkan) of B. S. & Co., this agreement being now nullified by the British black-list. Accordingly on

August 4, 1916: M. S. A. S. (1913), Ltd. and John Ballot, as purchasing trustee, make another agreement with Otto Frohnknecht and Benno Elkan "doing business as B. S. & Co., American branch at No. 61 Broadway in the City of New York." By this agreement the trustee, John Ballot, purchases everything owned by M. S. A. S. (1913), Ltd. and agrees to transfer it to a new corporation. At the same time the agency agreement, now nullified, of 1915 is modified so that Frohnknecht and Elkan become "general agents" for the new corporation, which, instead of paying them commissions is to issue stock to be held in trust by the Guaranty Trust Co. of New York, so that no benefits therefrom shall accrue to Frohnknecht and Elkan until the end of the War. By this it becomes possible for the new American corporation to deal with the two agents of B. S. & Co. without conflicting with the British black-list.

October 6, 1916: The above agreement is ratified by M. S. A. S. (1913), Ltd.

December 9, 1916: The new company, Minerals Separation North American Corporation, is organized under the laws of Maryland, in accord with the agreement of August 4, 1916.

January 1917: M. S. N. A. Corp. under its letter-head carries the following names: "General Agents, Beer, Sondheimer & Company, 61 Broadway, New York, Cable: 'Beersond'." This has been the office and cable address of the New York branch of the German firm of B. S. & Co.

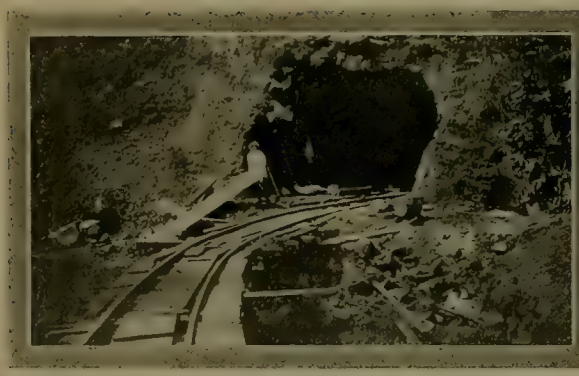
February 6, 1917: Otto Frohnknecht is admitted to American citizenship.

March 16, 1917: M. S. A. S. (1913), Ltd. goes into liquidation and ceases to exist.

April 6, 1917: The United States declares war on Germany.

May 22, 1917: Benno Elkan is admitted to American citizenship.

July 22, 1918: The property of Beer, Sondheimer & Co. is seized by the Alien Property Custodian. Among the assets is a block of 30,000 shares of Minerals Separation American Syndicate, Ltd.



NORTH PORTAL BEFORE PLACING MACHINERY

VICINITY OF SOUTH PORTAL

The 7000-Foot Tunnel at Lahaina, Hawaii

By Fr. KOELLING

On the south-western side of the island of Maui, second in size of the Hawaiian group, are situated the properties of the Pioneer Mill Co., Ltd., comprising some 28,000 acres. Of this area, 9500 acres is applied to the cultivation of sugar-cane, the principal industry of the islands. Owing to the low average rainfall over the lower cultivated area at Lahaina, an extensive irrigation system is maintained. To give an adequate idea of the enormous amount of water required for a plantation of the extent of Pioneer, it is only necessary to state that between 85,000,000 and 100,000,000 gallons of water is used daily, of which quantity 40% is furnished by high-lift pumps. Water is lifted by the pumps from wells at sea-level to an average head of 260 ft. The remaining 60% is supplied by mountain streams and tunnels, the latter forming the subject matter of this article. In the mountains back of Pioneer is situated the beautiful Honokowai gulch, one of the grandest and most picturesque to be found on Maui. Far back in the narrowest part of the gulch, under heavily forested and almost perpendicular cliffs that tower above it some 1000 ft., is situated the north portal of the 7000-ft. Honokowai tunnel which is being constructed to replace a semi-circular galvanized-iron flume that has been used since 1898. Although parts of this flume are still in fairly good condition and would have lasted for several years more, the redwood trestles had deteriorated to such an extent that the Pioneer Mill Co. concluded to abandon it altogether. The tunnel will not only have the advantage of permanency, but will also have ten times the present capacity of the flume.

The tunnel, which is situated at an elevation of 1525 ft., is of horse-shoe section, 6 by 6 ft. inside of concrete lining, and is designed for a capacity of 50,000,000 gal. daily. Power for the tunnel is furnished by hydro-electric stations, operated in synchronism, having a total capacity of 2000 kva. The nearest station is at an elevation of 940 ft., 11,000 ft. distant from the north portal and 8500 ft. from the south portal, as measured along the transmission-lines. The transmission-line consists of three No. 6 galvanized iron wires (later to be used for fence purposes) strung on proper insulators of temporary construction, carrying 6600 volts, which is stepped down to 440 at the portals. The longest span is 700 ft., across a gulch on the south-portal line. This line branches from the north-portal line 4000 ft. from the power-house, and this latter section carries 250 kva.; 40 kva. for the blacksmith-shop there, 120 kva. for the north portal, and 90 kva. for the south portal. This station derives its power from the Honokowai stream and from water developed from mountain tunnels, and on completion of the tunnel will be enlarged and moved to a new place.

OLD FLUME IN HONOKOWAI GULCH

The machinery for the north heading consists of one 10 by 10-in. Laidlaw-Dunn-Gordon compressor with 50-hp. motor, one 8 by 8-in. Ingersoll-Rand compressor with 35-hp. motor, one size 5 type B American blower, with 15-hp. motor, one Allis-Chalmers motor-generator set of 12½ kw., one 3½ by 10½ ft. air-receiver, one three-

ton Jeffrey locomotive with Edison battery, cars, rails, pipe, lumber, transformers, etc. This was all hauled by Holt caterpillar traction engines to an elevation of 2500 ft., directly above the north portal. At this point, an A frame with sheaves, 'dead-men', etc., was erected and a ⅝-in. steel cable run to the opposite side of the gulch and anchored to a number of large trees, 300 ft. above the bottom of the gulch and opposite the portal. The cable was drawn taut by the 45-hp. caterpillar engine traveling down the mountain road, after which the load was hung on two sheaves running on the cable and slacked down by a 3-in. manila rope until it was directly above the bottom of the gulch, when both cable and rope were slacked together and the load landed at the portal. The heaviest load weighed 2¼ tons.

The south portal is in a gulch, and a 12-ft. road, 1500

LOWERING AIR-RECEIVER FOR COMPRESSOR, SHOWING PRECIPITOUS CHARACTER OF COUNTRY

ft. long, was constructed along its side on the grade of the distribution ditch which will later take its place. The machinery for this end was hauled by Holt caterpillars directly to the portal. It consists of one 16 by 14-in. and 10 by 14-in. duplex, Imperial type 10, Ingersoll-Rand compressor with 100-hp. motor direct connected, one 12½-kw. Allis-Chalmers motor-generator set, two No. 4 Sturtevant blowers with 3-hp. motors, one 4 by 6 by 8-in. duplex Worthington pump, and one Jeffrey electric locomotive, transformers, etc. A blacksmith-shop situated at the main camp half-way between the two portals is equipped with one 8 by 8-in. Laidlaw-Dunn-Gordon compressor, 20-hp. motor, No. 635 Leyner sharpener, forge, drill-press, emery wheels, etc. The steel is sharpened with a four and five-point regulation Leyner die and plunged for tempering.

In the north heading, two No. 18 Leyner drills and four sets of 1¼-in. hollow steel from 24 to 96 in. are used, one machine drilling 6 ft. per hour and averaging 1150 cu. ft. of free air at 80 lb. pressure per lineal foot of hole drilled. The water for the drills and compressor is taken from the stream at an elevation far enough above the portal to give 45 lb. pressure. The air-line is 2 in., and the water-line 1 in. galvanized-iron pipe. In the south heading, two No. 9 Leyner drills and four sets of 1⅜-in. hollow steel from 24 to 96 in. are used. The pressure maintained at the compressor is 90 lb. per sq. in., and there is a large surplus of air. The water for the drills is forced into the tunnel and compressor by a 4-in. Worthington duplex pump, regulated to 40 lb. pressure and operated by air. Three shifts of two drillers, two helpers, three shovelers, and a shift-boss are employed. A 7-ft. round of from 10 to 16 holes is drilled in 7 hours, one hour being taken up in setting-up a bar twice, loading holes, etc. The drills are mounted on horizontal bars; several shoveling-sheets 5 by 5 ft., stone picks, and square-pointed shovels are used. The ventilation in the north heading is supplied through an 8-in. pipe from the blower making 2400 r.p.m., under a pressure of 2 lb. per sq. in. At the south heading 16-in. pipe is used, the blowers making 1800 r.p.m. under very low pressure. Immediately after blasting the blowers exhaust for 20 minutes and thereafter force fresh air continually into the tunnel. Underground currents of air have been encountered, at times sufficient to extinguish a candle when applied to the vent. This aids ventilation somewhat. For illumination, 50 and 75-watt, 110-volt Mazda lamps are used. The main camp, power-house, and both portals are connected by telephone, which can be connected to the plantation system when necessary.

The rock penetrated is of volcanic origin, consisting of two main varieties: (1) Trap rock, a hard, blue, flinty rock, in dikes of from 2 ft. to 100 ft. in width. And (2) water rock, a hard porous rock, containing many olivines and a burnt, crumbly, formation interspersed. In drilling this porous rock, much time is lost in extracting the larger drills on account of its crumbly nature. This tends to pack around the drill causing it to stick in the hole. It is often necessary to 'shoot' a drill, and when loading, the holes become 'dogged' with small rocks. In driving a similar tunnel on the island of Oahu, 750-ft. elevation, water was encountered after each vertical dike had been drilled through on the windward side of the island, until about 2000 ft. past the middle of the range. No water has been encountered in the Honokowai tunnel. This may be explained by its being on the leeward side of the island, the water draining to the windward and more precipitous side. Gelatine powder, 40%, triple-tape fuse, and No. 6 caps are used. Fifty pounds of powder breaks about 4½ ft. The only timbering necessary was between station 16+30 and 17+00 in the north heading where a cave-in took place, caused by the loose nature of the rock. The waste is transported in side-dump, 1-yd.

Koppel cars, and hauled by a three-ton Jeffrey electric locomotive. The track is 24-in. gauge.

The machine-drills were started in the north heading on August 5, 1917, and in the south heading on October 7, 1917, 950 ft. having been driven by hand. The two headings were brought together on March 30, 1918, 3802 ft. from the north end and 3198 ft. from the south end; the centre line was out 6 in., the grade and distance being correct.

The actual time of excavation was 10 months. Had all the equipment been in operation from the start, the tunnel could have been excavated in 7 months. The maximum monthly progress was made in December, 1054 ft. being driven in 28 days, or an average of 37.64 ft. per day. The cost per foot for the excavation has been approximately $11, and the cost of lining the tunnel is estimated at $2, which will bring the cost of the main tunnel to $13 per foot. Two feet of the sides and floor of the tunnel are now being concreted, the aggregate being taken from the dump. A small crushing plant with sand rolls, etc., has been erected at the south adit. Two mixers operated by gasoline are in use. In connection with this tunnel, a feeder tunnel of 25,000,000-gal. capacity, 813 ft. long, and three lateral tunnels of 35,000,000 gal. capacity, 1152 ft. long, have been completed. Two intakes are in course of construction, and a concrete flume at the south portal, 2700 ft. of supply ditch, pipeline, and storage reservoir remain to be built.

Calculating Percentage of Recovery in Concentration

By ARTHUR H. P. MOLINE

*In small mills it is usually inconvenient and often impossible to weigh all the material treated and products obtained. Where the weight of concentrate in any process is so small as to be negligible in comparison with the weights of feed and of tailing, it is then a simple matter to obtain the weight of feed from the assay-values and the weight of the concentrates. Call the assay-value of the feed and tailing respectively F and T, and the weight of concentrate C, then $\frac{C}{F-T}$ = weight of feed, and the percentage recovery = $F\text{-}T/F \times 100$. F, T, and C may be given in any suitable units provided they are all the same. For example, in cyanide work, F and T may be expressed in grains per ton, and C in grains. Then the equations given above hold. Where the weight of the concentrate produced is an appreciable proportion of the total weight treated, as in lead or zinc concentration, the problem is not so simple, and the following method is suggested. It is assumed that the following data are available: Assay-value of feed; assay-value of tailing; assay-value and total weight of concentrate produced.

Let F = weight of lead in feed, unknown.
f = weight of gangue in feed, "
T = weight of lead in tailing, unknown.
t = weight of gangue in tailing, "
C = weight of lead in concentrate, known
c = weight of gangue in concentrate, "

Gangue includes everything that is not lead. Assay-values of feed and tailing are known, so that the ratios f/F and t/T are known. Call f/F K and t/T n; then $f = KF$, and $t = nT$. It is obvious that:

$$F = T + C \quad (1) \text{ lead equation}$$
$$f = t + c \quad (2) \text{ gangue equation}$$

In equation (2), substitute for f and t the values KF and nT, respectively. Thus we have:

$$KF = nT + c \quad (3)$$

and multiply equation (1) throughout by n, giving

$$nF = nT + nC \quad (4)$$

Subtracting (3) from (4) we eliminate T and obtain

$$(n-K)\ F = nC - c$$

$$\text{therefore } F = \frac{nC - c}{n - K} .$$

giving the value of F in quantities all of which are known, and then

$f = KF$
$F + f$ = total weight of feed (dry)
$C/F \times 100$ = percentage recovery

The accuracy of the method depends, of course, upon the accuracy of the sampling, and unless this can be relied upon, the result may be misleading. It may be pointed out that the higher the percentage recovery, the less liability there is to error. F is inversely proportional to $n-K$, and if the recovery is low the values of n and K will contain all the errors due to the sampling and assaying of the feed and tailing. Those errors may be compensated to some extent, but this cannot be relied upon. The greater the difference between the values of n and K, the less will be the effect of errors in sampling and assaying on the result of the calculation. The method is applicable obviously where two products only additional data are required in order to solve the problem.

*Abstract: 'Chemical Engineering and Mining Review.'

ALUMINUM of good grade containing over 99% aluminum, when poured at 1000° C., shows slightly less ultimate strength than when poured at 750°; this would indicate that overheating is not as serious as has been claimed. Occasionally aluminum castings are found to be pitted with small surface holes and the body of the metal may be contaminated with Al_2O_3; there is then no remedy but to scrap and re-melt. When magnesium, sulphur, $ZnCl_2$, or $Na_2B_4O_7 + KHSO_4$, were used, no favorable effect is noticed.

ORTHOCLASE varies in potash content from 6 to 15%. It is rare to find a dike of orthoclase, however, containing above 8%. High-grade orthoclase is in some demand in the fictile art, and under exceptional circumstances, such as nearness to cheap transportation and a cheap supply of common salt and fuel, together with proximity to market, it might serve as a source of potash.

Standard Method for Zinc-Lead Assay

By W. GEORGE WARING

As a result of the efforts made in the Joplin district to standardize the methods for determining lead and zinc in ores and concentrates, a committee, constituted of the chemists and assayers connected with the industry, collected information regarding nine different schemes of analysis, and reached the conclusion that fairly accordant results are shown in assays made by the colorimetric, gravimetric, and iodide methods. No reports were submitted as to the oxalate-permanganate, or the electrolytic-lead-dioxide methods, which are recognized as possessing a high degree of accuracy. The electrolytic was not considered suitable to the conditions in the Joplin district, and the colorimetric requires a special equipment that excludes it from being considered. The gravimetric method is thoroughly reliable, but requires much skill in manipulation. The chromate method, in its several modifications, gave fair results, while the molybdate method proved unreliable as tested on three samples. The committee fully realized the convenience and rapidity of the 'direct chromate' method, but owing to the necessity for establishing without delay a standard procedure that should be above suspision the sulphate-chromate method, as given herewith, was recommended.

Use 3 or more grammes of ore as the sample for analysis. Decompose with not less than 4 cc. HNO_3 and 2 cc. of H_2SO_4 for each gramme of ore taken. Boil rapidly to heavy SO_3 fumes in a covered casserole or beaker. Cool sufficiently. Wash down and disintegrate the cake with 15 cc. of 'lead acid' (see below) per gramme of ore, avoiding any loss. Add about 0.5 gm. cryst. sodium sulphate, or 0.25 gm. of the dry salt, and boil for a minute after the cake is all dissolved with the exception of the insoluble portion. Cool thoroughly and allow to stand undisturbed for half an hour. Filter through Whatman No. 5, 40 or 42 filter, by decantation at first, returning the first filtrate to the filter before washing. Wash the residue into a filter with 'lead acid' from a wash-bottle, thoroughly rinsing the casserole or beaker with 'lead acid,' and wash the residue or filter with 'lead acid' three times; then instead of washing the 'lead acid' out of the casserole or beaker and out of the residue with 50% alcohol, use pure water containing 1 cc. of strong H_2SO_4 to the litre, repeating this washing once. Be sure to wash the filter-paper from the top down. Those who are equipped with the proper facilities for color comparison can proceed from this point for the colorimetric tests. The use of a few drops of dilute gum arabic solution (about 1%) to the lead acetate solution before adding alkaline sulphide is recommended.

Next dissolve the $PbSO_4$ in the residue, and filter in hot ammonium acetate, washing through the filter with acetate solution until a drop of the filtrate washing no longer darkens a drop of Na_2S. Dilute the filtrate and washings, if necessary, to a volume of about 200 cc., make weakly acid, if not already so, with acetic acid. Heat to boiling and add a normal or nearly saturated solution of potassium bichromate in distinct excess, boil five minutes to make the precipitate crystalline and easier to wash. Keep this mixture very near the boiling temperature on a hot plate for 30 minutes, then filter through a close filter, the same kind as that used for the $PbSO_4$ residue, and wash out the excess of $K_2Cr_2O_7$ thoroughly with hot water. Then treat the filter paper and the precipitate in a suitable beaker with 10 cc. of 20% NaOH solution, stirring to effect complete solution; acidify with 30 cc. of 1 to 4 H_2SO_4, dilute to 100 or 200 cc., add with a volume-pipette 10 cc., 20 cc., or such measured amount of standardized ferrous ammonium sulphate solution as will leave a moderate excess of ferrous iron, and titrate that excess with standard permanganate. The value in terms of standard permanganate of the total ferrous solution added, less the permanganate required for the reverse titration, when multiplied by the lead value of the permanganate referred to chromate of lead gives the amount of lead.

The effective standard solution is the permanganate. Whatever convenient standard is used in the laboratory for the iron titrations will serve for the lead chromate. The ferrous ammonium sulphate solution may be made to correspond as nearly as possible with the permanganate. If 1 cc. of permanganate = 0.0005 gm. Fe, then 35.11 gm. of pure ferrous ammonium sulphate dissolved with 10 cc. concentrated H_2SO_4 in water to make one litre will give a solution of corresponding strength. A small piece of pure aluminum should be kept in the solution to maintain the iron in the ferrous state. The value of the solution in terms of the standard permanganate must be known at all times.

The reaction of lead chromate with ferrous sulphate being $2(PbCrO_4 + 8H_2SO_4 + 6FeSO_4 = 3Fe_2(SO_4)_3 + Cr_2(SO_4)_3 + 2PbSO_4 + 8H_2O$, 6 parts of ferrous iron corresponds to 2 parts of Pb, or 1 part ferrous iron = $\frac{207.2}{167.52} = 1.2368$ parts Pb, and 1 cc. of the standard permanganate will correspond to 5×1.2368 or 6.184 mg. Pb, or in round numbers 6.2 mg. If then 6.2 gm. of ore be taken for the assay, each cubic centimetre of permanganate, representing ferrous iron oxidized by chromate, will therefore represent 0.1% Pb.

The 'lead acid' above referred to is a solution of 65 cc. of strong H_2SO_4 (120 gm.) in 2000 cc. of water, to which solution, while hot, is added with stirring a solution of 0.5 gm. of lead acetate in 135 cc. of water, making about

2400 cc. This solution is allowed to stand for several days to settle, and the clear solution is then siphoned off through a thick asbestos filter for use. The use of this acid makes it unnecessary to consider the solubility of the lead sulphate. If a solution made with 'lead acid' is evaporated to any extent, it should be brought to the original volume with pure water before filtering; consequently, when the lead sulphate is filtered, no more lead remains in the filtrate than was originally added in the 'lead acid.' (Jour. Ind. Eng. Chem., June 1914, p. 548).

The solubility of $PbSO_4$ in pure water was determined by Kohltausch at 4.1 mg. per 100 cc. = 2.80 mg. Pb, and by Fresenius at 4.38 per 100 cc. = 3.00 mg. Pb. Fresenius determined the solubility of $PbSO_4$ in water containing H_2SO_4 as 2.74 mg. in 100 cc. = 1.87 mg. Pb. Recently (I. Schnaal in Compt. Rend., 1909, pp. 1394-1396) found that pure water dissolves 8.24 mg. $PbSO_4$ per 100 cc. at all temperatures, and that, as H_2SO_4 is added, the solubility diminished until, with one part of H_2SO_4 per 1000 of water, the $PbSO_4$ is absolutely insoluble.

Waring, in 1910, collected the zinc sulphate filtrates and washings from 22 assays of 3 gm. each, of zinc-blende ores which were being assayed gravimetrically for lead, without using alcohol. These filtrates were allowed to stand quiet for a week, the light additional $PbSO_4$ sediment filtered off, and the lead in the clear solution carefully determined, with the following results:

	Grammes Pb	Per cent
Original $PbSO_4$ residue	0.4030	0.6105
Sediment from the filtrates	0.0058	0.0090
Final clear filtrate	0.01676	0.0254
Total		0.6449

The amount of lead in the clear filtrate (1880 cc.) represented 8.9 mg. per litre. The samples averaged 59.04% Zn, 2.05% Fe, 0.037% Cu, and 0.176% Cd.

C. E. Heinz has recently evaporated the filtrates from 49 lead assays of 127 gm. of zinc-blende and found in these 0.0248 gm. of lead, representing an average loss of 0.0508% in each assay. The volume of filtrates evaporated was 7250 cubic centimetres.

TUBE-MILL PEBBLES AND LINERS, amounting to 12,000 and 3050 tons, respectively, were produced by domestic deposits in 1917. Imports were valued at $197,156, representing about 15,000 tons. The domestic substitutes for imported flints have given satisfaction and have been no more expensive—some have been less expensive—than the French, Danish, and Belgian materials, facts attested by reports of the consumers in letters to the producers and to the U. S. Geological Survey, and even more emphatically by repeat orders.

A SEMI-OFFICIAL STATEMENT in the 'Rangoon Times' gives the wolfram output of the Tavoy district of Burma as 3652 tons for 1917, against 3036 tons in 1916, and 2115 tons in 1915. The Tavoy district produces 80 to 90% of the wolfram produced in Burma.

Water and Electricity

By T. D. MacCORMACK

Some time ago I witnessed a fire at the Washoe reduction works caused by a short-circuit at an electric switch-board. The pressure was 2200 volts. When the short-circuit occurred, a loud humming noise was caused by the current. Some of the employees, becoming excited at the appearance of such a fire caused by this high voltage, retreated to a safe distance. However, one of them picked up courage and connected the fire-hose to the water-line. After he had done this he took his place at the nozzle to direct the stream onto the fire, and then called on the other men to turn on the water. Fortunately for him, nobody heeded his request. If the water had been turned on he would have been electrocuted instantly, as the water coming in contact with the live wires would have conducted the current through his body, and he would have undoubtedly received the full charge of 2200 volts. When told what would have happened to him if the water had been turned on, he said, "I didn't know that." If the water had been turned on he never would have known. If he had stopped to think twice before acting he could have seen that the better informed men, who understood the danger of trying to extinguish the fire with water, were using the chemical fire-extinguishers, which were available at convenient places throughout the plant. A dangerous practice, of similar kind, is that in which workmen indulge when sprinkling the smelter yards. They sometimes deliberately elevate the stream of water to a height almost sufficient to come into contact with the high-voltage B., A. & P. railway trolley-wires. These lines run through many places in the smelter-yards, and I hope that this may serve as a warning to those men who do not realize the great danger to which they expose their lives by playing a stream of water upon a conductor carrying electric current.—'The Anode,' July 1918.

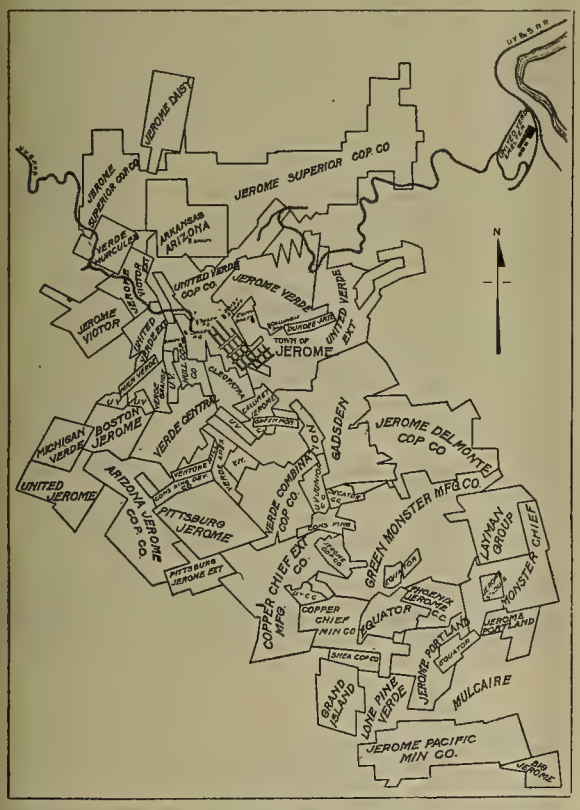
ALUMINUM in the framework of a modern German zeppelin, according to notes furnished to a London journal by a French officer, is used to the extent of 10 to 12 tons. This seems an enormous bulk, as the metal is so light. The covering of the 18 balloons enclosed inside the big outer envelope is made of a cotton substance, lined with 'goldbeater's skin,' instead of with rubber, and the quantity used is so large that the intestines of 30,000 cattle go into the material for one zeppelin. Each of the 18 balloons is fitted with a valve, and separated from those on each side of it by a funnel to carry off the explosive mixture of the hydrogen of the balloons, the oxygen of the air, and the gases given off by the engines. When all five motors are working together, one contained in the forward car, one in each of the two side cars, and two in the rear car, the speed attained is 68 miles per hour, but, as a rule, all the engines are not used at one time, and the normal rate of flight is from 50 to 56 miles per hour. The ordinary crew consists of 22 men.

REVIEW OF MINING

JEROME, ARIZONA

Apex Suits at Verde Denied.— U. V. X. Smelter.

At the end of an interesting talk on the War and conditions in France, James S. Douglas, president of the United Verde Extension Mining Co., on July 30 surprised his audience by denouncing those who were responsible for the circulation of the rumor that the Clark interests are planning to institute apex proceedings against the Extension. Among those who heard him were a number of the shareholders of the company. Mr. Douglas said that the rumor was undoubtedly started by brokers who expected to profit



PROPERTY MAP OF VERDE DISTRICT, ARIZONA

by commissions on sales of stock. He pointed out the impossibility of the apexing of orebodies in the Verde district on account of the fact that there are no veins, the ore lying in deposits. He stated that since a decision rendered in a case from the Warren district about thirty years ago there had been no apex suits in the State of Arizona and that the copper companies had always respected the vertical side-line rights of adjoining properties. He expressed himself as feeling convinced that no company in this district would attempt to follow ore outside of its own side-lines, and stated that the Extension certainly did not intend to do so. Mr. Douglas, in speaking of his company's relations with W. A. Clark and the United Verde Copper Co., said: "Our big neighbors up on the hill have treated us (the U. V. X.) with the utmost consideration. W. A. Clark and Charles W. Clark gave us permission to start our haulage-tunnel on their ground. Without that permission it would have been impossible for us to bring the tunnel into the mine on the 1300-ft. level." For the past two weeks or more rumors have been current to the effect that the Clark interests, through their holdings in the Hull Copper Co., intended to institute apex proceedings against the Extension, and some reports went so far as to state that such a suit had already been filed. That such stories have had an effect is evidenced by the drop in the price of U. V. X. shares, they selling down from $39.50 to $35 about a week ago. Although a number of smaller holders became frightened and disposed of them, the general opinion held here is that nothing would come of such a suit. However, it was feared that the filing of a suit would have the effect of lowering the price. After it had receded to $35, it began to rise, and on June 31 was $38. When the rumor reached Mr. Douglas at Douglas he immediately advised his friends and large holders not to dispose of any. His advice was evidently taken, for not only did they hold on, but it is reported on good authority that a number took advantage of the low prices obtaining to increase their holdings.

Mr. Douglas has announced his intention of returning to France in the fall. In the meantime, after spending some time attending to business affairs in Arizona, he will go to Canada, where he will work in the wheat fields in an attempt to rid himself of hay-fever.

The U. V. X. smelter has been in blast for a number of days and it is reported that the furnace is reducing about 300 tons of ore daily. This amount will be increased soon to the full capacity of 500 tons. No figures relative to the grade of ore being treated have been given out.

BUTTE, MONTANA

Silver and Manganese Ore.—Development on the East Side.

The increased price of silver, coupled with the demand for manganese, has revived leasing in the distinctively silver area of the Butte district. West of the city the Butte-Plutas company, a local syndicate, is prospecting a strong vein in the Plutas claim, never opened before. The property has an electric hoist and air-compressor. The shaft is 125 ft. deep, and a cross-cut is being driven to the vein. A few hundred yards from the shaft is the Norwich claim, under lease and bond to James E. Higgins. Here there are two parallel veins, the northern carrying 3 to 5 ft. of block ore averaging 30% manganese, of which daily shipments are being made. The silicious hanging-wall streak assays well in silver, and will be shipped also. The property is to be prospected to depth by a second shaft. The vein was opened farther west in the 'nineties and extensively mined for silver ore.

The Hibernia mine, in the same area, is being operated by the Davis-Daly company and has a large quantity of ore blocked out.——The Philadelphia shaft, better known as the Nettie mine, is producing 50 to 150 tons per day of silver and manganese ore.

The Germanic group, under development by Butte & Superior interests, with W. F. Murphy as superintendent, is cross-cutting to the Tzarina lode, the biggest and most prominent vein in the district. Despite its size and most attractive outcrop, it has never been opened below 100 or 200 ft. by its owners. The same vein farther east, in the Ancient claim, has yielded quite pure rhodonite (manganese carbonate) ore, carrying a few ounces of silver. Shipments of this ore are being made by W. A. Clark, from the Travona shaft, re-opened within the past year.

A half dozen lessees are at work on various tracts in the western section, getting out the manganese-silver ores of the oxidized zone, mostly by windless work.

To the north, the Anselmo mine, in the heart of the new residence district, near the School of Mines, is being operated for New York interests by Joseph A. Pyle. Within the last month there was shipped 2000 tons of complex zinc-lead-silver ore to the Anaconda company's zinc plant. The mine is 500 ft. deep and has a full electric equipment of hoist, compressor pumps, etc. The Anselmo is west of the Gagnon mine, and is supposed to carry the western extension of the Parrot-Original-Gagnon lode.

Near the reservoir, and west of the Centerville section of Butte, is the Evelyn mine, purchased last year by W. A. Clark and operated until a few months ago. The veins are large but low grade, and as driving on the 500-ft. level did not come up to expectations the mine is temporarily closed down.

On the Rainbow lode, the great silver lode whose massive outcrop of black-stained quartz practically delimits the copper-bearing area of Butte for the outlying undeveloped 'silver' area, the Alice mine is being operated by the Anaconda company. The Moulton mine, farther west, is operated by Mr. Clark, and the adjacent Amy Silversmith under lease by Ellingwood & Richards. The Goldsmith mine, the next mine west, is now being re-opened by the Crystal Copper Co. This was a bonanza producer of former years, yielding over 1,500,000 oz. from one vein, opened to a depth of 367 feet.

A new electric equipment has been erected at the old Troy shaft, re-opened, re-timbered, and sunk 100 ft. deeper. Cross-cutting is now under way to reach the north vein, about 60 ft. from the shaft. Mr. Hill is mine superintendent.

In the eastern section of the district, the old Butte & Bacorn company is still prospecting its vein, so far without success. It is understood that a shut-down is expected as a result of the 50c. wage increase granted by all companies early in July. The Main Range mine of the Tuolumne company continues to ship 60 to 75 tons of ore daily from stopes above the 700-ft. level on the Spread Delight vein. The cross-cut on the 800-ft. level reached the vein recently, making connection with the winze sunk from the 700-ft. level. The hanging-wall streak of crushed quartz in the vein carries a high silver content. It is interesting to note that the shipments of ore from the mine in 1917, returning over $200,000 from the smelter, averaged about 2.7% copper but contained over 8 oz. of silver per ton, which is probably the record for silver content from any of the copper mines here.

South of the Tuolumne company's holdings, the Sarsfield shaft of the North Butte company is showing an attractive outcrop, at the base of the Continental Divide range, the mountain ridge which shuts in the district on the east. The mine has good oxidized ore of shipping grade at the surface, but the deep work is expected to determine the value of the 'east side' holdings of the company, for which it has already spent over $1,500,000, and on which its future rests.

The Nipissing company of Cobalt has given up its option on the stock of the Copper Czar mine, after spending $100,000 on the property. The tract shows a deceptively-stained outcrop of altered granite, with a 5-ft. quartz vein in the centre. In recent operations the shaft was deepened to 300 ft., and 900 ft. of cross-cut work done; but the veins encountered appear to be merely 'roots,' according to local opinion. On the slopes above, Ed. Hickey, operating the Honolulu, has taken out some excellent gray copper and chalcopyrite ore from the Receiver vein. The Receiver mine is still operated under lease.

In the heart of the city, lessees working on the Syndicate lode claim, near the Belmont shaft, have taken out ore of unusual character from the stopes on the 125-ft. level. This ore carries chalcopyrite, zinc, and no glance, though it comes from an east-west vein.

The outlying districts show less activity than usual, owing to the high cost of supplies and high wages. A strike of ruby silver ore was made last week on Linlow creek, near the old Ruby mine. It promises to be another producer of high-grade ore, similar to the Ruby & Columbia. The ore is an altered rhyolitic rock.

MATAQUESCUINTLA, GUATEMALA

General Notes on Silver and Chrome Mining.

In Mataquescuintla county, the Mataquescuintla Mining Co., owners of El Rosario, Los Ocotes, and Magdalena mines, has just completed part of the work of re-opening and unwatering the old San Francisco workings. This mine was exploited by a native company in 1888. It erected a 20-stamp mill. Considerable chloride of silver was found in the mine, yielding over 300 oz. per ton. The ore actually available in the workings so far cleaned out, amounts to 600,000 tons, averaging $34 per ton. In El Rosario mine an adit is being driven to cut the vein below the San Francisco level. Average samples taken every 10 ft. across the vein in this mine assay from 0.01 oz. gold and 7.4 oz. silver per ton to 6.01 oz. gold and 54.20 oz. silver. The property is said to be for sale.

A rich vein of stibnite (antimony sulphide) was discovered in this district recently. It promises to develop well. Considerable work is being done at La Montanita mine, on a vein of lead carbonate, carrying silver.

In Casillas county, the San Bernardino and Santa Clara mines have large quantities of ore ready for shipment. It carries from 100 to 180 oz. of silver per ton and 50 to 70% lead.

In Jalapa county the chromic-iron deposits of Potrero Carrillo and Patachee, owned by the railroad company, are being worked. Ore is shipped every month to New York. The property will soon be on a large producing basis. The ore assays 59% Cr_2O_3. B. T. Wells is manager.

The Silver Lead Mining Co. recently found a wide deposit of pyrrhotite, containing nickel and cobalt. It is near Sansare, 9 miles from rail. A large quantity of ore is available for immediate extraction. Early shipments are to be made.

VICTORIA, BRITISH COLUMBIA

Chrome Deposits.—Demand for Base Metals for Shells.—A Future Gold Producer.—Geological Survey.—Ore-Testing.—Roads and Trails.—Abrasives.

Chrome deposits in this Province will probably be developed. W. J. Nicholls and associates of Spokane, Washington, have secured claims at Cascade, B. C. The property was purchased after an examination by George Crerar, of Spokane. The chrome at Cascade has been reported on by the Provincial Mineralogist. The deposit to which he refers, no doubt the same as that in question, is within 4000 ft. of the C. P. R., and in the Grand Forks Mining division. P. B. Freeland, resident engineer, said last year that little development had been done. Ore carries from 30 to 50% Cr_2O_3 and was worth investigation. There were 250 tons on the dump, and the owners were trying to get a permit to

ship it. The serpentine rock carries 3 to 10% chrome. W. M. Brewer, resident engineer at Nanaimo, reported in 1915 that chrome existed on Scotty creek, near Clinton. The claims had been staked, abandoned, and then re-opened. Little development had been done. Selected samples ran 33%. Some low-grade ore might be concentrated, but development was not such as to admit of any estimate of quantity.

As the Kootenay and Boundary districts are producers of lead, zinc, and copper, it is expected that mining will be considerably accelerated as a result of orders received in Canada from the British government for a large increase in shrapnel

Considerable development is being done on the Molly Gibson gold-silver mine in the Nelson district. A tunnel is being driven 160 ft. below the upper workings to get in below the orebody and allow the rock to be stoped down and taken out by gravity, thus considerably reducing costs. Those interested believe that it is destined to prove one of the big gold producers of British Columbia. A shipment to the Trail smelter yielded $22.76 per ton. The Provincial Mineralogists' report for 1917 shows that work was started in July at the mine, and in August at the mill. Some 367 tons of crude ore was shipped to the smelter. The mill dressed 1759 tons, yielding 134 tons of concentrate, which was not shipped. A flotation plant was installed and a Hardinge ball-mill was to be put in. Fifty men were employed.

The Geological Survey of Canada is to establish a permanent office in this Province, with Charles Camsell in charge. This will be a great aid to local mining.

An experimental ore-testing plant to cost $50,000 will probably be established by the Dominion government in British Columbia before long. The works may be at Vancouver or New Westminster, near rail and water transportation. This will be another great benefit to the Province, as in the past many unsuitable ore-treatment plants have been put up by mine-owners in the Slocan and Boundary districts, simply for the want of good advice. "If we had had such an experimental plant years ago," stated a mining man recently," most of the mills of the Slocan would be showing a recovery of between 90 and 92% instead of, in some cases, only between 60 and 65%."

It was stated by the Minister of Mines during the recent session of the Provincial Legislature that of the $200,000 voted in 1917 for mineral development, by way of assistance in trail and road construction, the sum of $142,000 had been spent. He said that an additional $75,000 was provided in the estimates for 1918 for a continuance of the policy. Out of $100,000 provided in 1917 for assistance to mines by way of engineering advice, drilling, etc., a total of $21,000 had been spent, and $25,000 more had been provided for the current year.

Inquiries are being received by British Columbian mining officials as to the resources of the Province in regard to infusorial earth, tripolite, or kieselguhr. It is explained that it is required in Great Britain, especially at Manchester, in the manufacture of asbestos. Before the War this mineral was imported from Russia and France, but the supply is now unavailable. British Columbia has considerable quantities of infusorial earth, probably the best known deposits being situated 20 miles north of Savona, B. C., a C. P. R. station, where there are beds up to 30 ft. thick. In view of the demand it is thought likely that active development will be undertaken in the course of the next few months.

Fatal accidents in metal mines during the first half of 1918 total five, against nine in 1917. In the coal mines there were six compared with forty.

There will be eight parties of the Geological Survey branch of the Dominion Mines Department in the field in British Columbia this summer. Several are already at work. As there are only 25 such parties in Canada this year, the comparatively large proportion assigned to this Province is taken as an indication that the Dominion authorities are recognizing to a greater extent than ever its importance.

GOLD HILL, OREGON

Gold and Chrome Operations.

The lessee of the Ray & Haff gold-quartz claims, J. G. Davies of Sacramento, three miles north of Gold Hill, has made another important strike after a year's work. The ore is galena, carrying from $18 to $30 per ton in gold.

The Red Oak gold-quartz claims, on Galls creek, four miles south of Gold Hill, an old producer of rich ore, has been sold to R. E. Doan of Gold Hill, and Portland, Oregon,

ALONG THE ROGUE RIVER, OREGON

associates. The property has been idle for 20 years, so it is to be re-opened at once.

Grants Pass.—R. J. Rowan, engineer in charge, reports that the Golconda chrome mine, with several other small mines worked in connection in the Waldo district, shipped 450 tons chrome ore in May, 1035 tons in June, and 1450 tons in July. There will be a slight increase over July shipments during the hauling season from Waters creek.

Medford.—The Anderson gold mine, an old-time producer closed down for 10 years, situated in the Ashland and Shorty Hope group zone south of Talent on Wagner creek, has been sold for $30,000 on a 60-day option by B. W. Worthington, L. D. Corbett, and M. A. Carter, of Medford, to Seattle men.

SUTTER CREEK, CALIFORNIA

Summary of Keystone Mines Report for Half-Year.

The Keystone Mines Co. of Amador City has issued a report for the six months ended June 30, 1918. Gold and concentrates sold realized $84,947 net. After paying for operations, taxes, interest, etc., the cash balance was $6110, compared with a balance of $5635 at beginning of the period. The indebtedness remains at $20,423. An advance in wages was made on May 1, but a shortage of men is felt. Supplies are higher, and an increase in power rates is expected. There is estimated to be more ore blocked out than at the end of the last period. The 2100-ft. level cross-cuts are to be continued. They are in greenstone. A stope 80 ft. above the 1200-ft. level shows 8 ft. for a length of 100 ft., of average grade. A large tonnage is available at 1400 ft. A station—38 by 42 by 10 ft.—has been cut at 2100 ft. The 900, 1000, 1200, 1400, and 1800-ft. levels yielded a total of 43,694 tons for the mill. The 40 stamps lost only 17 hours. Gold recovered by amalgamation was worth $4164, and from 2216 tons of concentrate $108,226, a total of $112,390. Freight and smelter deductions amounted to $26,588. Amalgamation saves very little of the gold now.

ARIZONA

Ajo.—On July 22 the New Cornelia company set off a large blast on hill No. 3 in the steam-shovel pit, using 68,000 lb. of powder. A week or so previous 40,000 lb. was exploded. In February, 50,500 lb. broke 200,000 tons of ore. Five shovels are at work now.

Aguila.—A small gasoline hoist is to be put on the manganese mine of John Rogers, who is in the market for same.

Bisbee.—Lessees at the Higgins property have until February next in which to extract ore, and locally it is said that they will make large profits. The present lessees were mining in the Southwest mine of the Copper Queen, but concluding that the vein went into Higgins ground, acquired it. Estimates show 30,000 tons of at least 35% ore available. Daily shipments to smelter amount to a carload of this rich ore.

Globe.—Arizona Commercial is reported to have opened high-grade bornite on No. 14 level east. Ore is now available between No. 7 and 14 levels.

The Iron Cap Copper Co. proposes to call in the present $125,000 outstanding 5-year 7% bonds due in 1921, and issue $500,000 8% 20-year bonds.

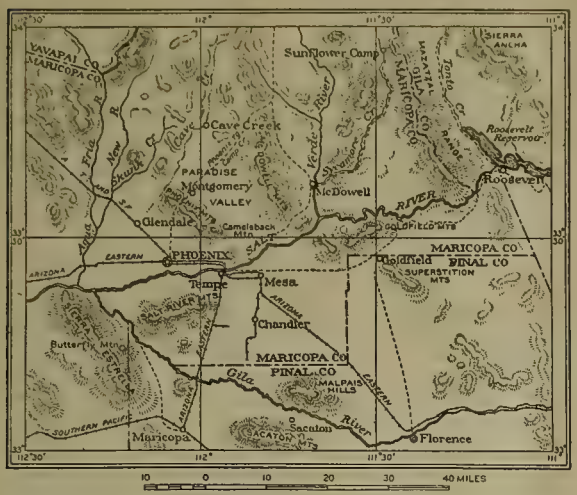
Holbrook.—A manganese property has been purchased by S. G. Mayfield, Box 38, who is in the market for concentrating machinery.

Jerome.—On July 30, the Labor Union warned mining companies that a strike would start the next day if their demand for an advance of $1.10 per shift were not granted. The Federal Mediator, Hywell Davies, had offered 50 cents. On July 31 the men accepted 75 cents, with reductions in rent, light, and water, of company houses.

Ray.—The Ray-Kelvin Mining Co. has issued its prospectus. The capital is 2,000,000 shares, $1 par. Arthur L. Kelley is vice-president and mine superintendent. The property adjoins the Ray silver-lead mine on the north, and Troy on the south. On the Continental claims there are numerous indications of copper. Lead-silver ore has also been opened. On the Last Chance group two tunnels are in iron for their full length, the iron carrying copper carbonate and chalcocite. The Marble King contains a large outcrop of iron and garnet. The sulphide zone is considered by the engineer, Mr. Kelley, to be near the surface. In this district is the Ray Consolidated, mining 300,000 tons of copper ore per month; the Ray Hercules is about to start its 2000-ton mill; the Ray Silver-Lead is shipping 700 tons per month; the Broken Hills is developing gold-lead-silver ore, also shipping; the Troy is opening copper ore; the Chilito has lessees on copper ore; the Apex is producing gold ore; the London Arizona is mining 200 tons of copper ore monthly; the Christmas is producing 7500 tons of copper ore per month; and the U. S. Vanadium Co. is developing vanadium ore.

Phoenix.—In Bulletin 690-D of the U. S. Geological Survey, F. C. Schrader describes the quicksilver deposits of the Phoenix mountains. These constitute an outlying desert range in Maricopa county. Mercury was discovered here by L. L. Brunson of Phoenix in March 1916. Copper has also been worked. The rocks of the area are metamorphosed sediments of pre-Cambrian age. They consist chiefly of quartz-schist, sericite-schist, slate, argillite, limestone, quartzite, kyanite-schist, and jasper, and crop out in belts or zones trending north-northeast diagonally across the range. They dip steeply to the south-east and are cut by cross-faults. The quicksilver deposits occur in two or more of the schist belts, in zones of shearing or fracture that parallel the lamination in the enclosing schist. These zones trend approximately N. 30° E. and stand nearly vertical. They range from 5 to 40 ft. or more in width, though generally without definite walls, and some have a known length of more than a mile. The deposits consist mainly of portions of the country rock that have been more than normally crushed and made schistose and later mineralized. They contain numerous specks, veinlets, films, small bodies, and crystals of cinnabar and meta-cinnabarite—the black secondary sulphide of mercury. A few globules of native quicksilver associated with the cinnabar ore have been reported from the Rico prospect. The gangue minerals—the chief constituents of certain stringers and veinlets—are quartz, calcite, hematite, and limonite. Kyanite and tourmaline are locally abundant in the ore, but are probably residual constituents of the replaced wall-rock. The ore-bodies occur largely along the planes of schistosity in the schist. Associated with the quicksilver minerals and occurring also independently of them are copper minerals, especially malachite, chalcocite, and a little chalcopyrite. In one place minute white metallic veinlets, thought to be stibnite or molybdenite, are present. The croppings of the lodes in general are not prominent but weather even with or below the surface of the adjoining country rock, with the result that most of the best exposures occur in the edges of washes or smaller channels of erosion. From the present development of the deposits it is impossible to estimate their ore-reserves. Three of the properties—the Mercury, Rico, and Seal Rock—have workable ore which averages 3% or better in quicksilver and which, to judge from the persistence of the lodes, probably has considerable horizontal and lateral extent. Likewise, from the constancy or improvement of the ore in depth so far as developments now extend, it seems that the ore may be expected to continue to reasonable depths, especially in the oxidized zone. From the accessibility of the deposits and their nearness to railroad and supplies, it is probable that ore averaging as low as 1% can be profitably worked with the metal at its present market price. The occurrence of the Mazatzal and Phoenix deposits on the same line of strike by no means implies continuity of the deposits throughout the intervening distance. It may be worthy of note, however, that the line of strike connecting the two areas crosses the northern part of the intervening McDowell mountains, which, so far as known to Mr. Schrader, have not been prospected for quicksilver. This alinement, taken in connection with the fact that these mountains are composed of rocks that are of the same classes and have the same general attitude as those in the Phoenix and Mazatzal areas, suggests that this part of the McDowell mountains, separated from the Phoenix mountains by Paradise valley on the west and from the Mazatzal mountains by the Verde river valley on the east, may be worthy of inexpensive prospecting. The

line of strike of what may possibly be a quicksilver belt should cross the McDowell mountains about 4 miles south-east of the road between Phoenix and Camp creek, or 12 miles from the Phoenix area. Accordingly, the more likely field in which to prospect in these mountains embraces an



SKETCH-MAP OF CENTRAL ARIZONA

area extending from the vicinity of Pinnacle mountain, 4 or 5 miles south-east to Mountain spring or McDowell peak. Owing to the cover of valley fill on the east, the west slope of the mountains will doubtless be found better exposed for prospecting, but the belt also includes Fraesfield mountain and other hills on the north-east.

CALIFORNIA

Auburn.—The Steele Chrome Co., managed by E. C. Montgomery, has commenced the erection of a 150-ton concentrating mill for its chrome ore on the property 12 miles from Auburn in El Dorado county. The mill will consist of a Hardinge ball-mill, Bunker Hill screens, classifier, and Deister sand and slime tables. The mill was designed by Mr. Montgomery and is being erected under contract by Cahill & Vensano Co., of San Francisco. A. H. Jarman is president. Elwin Benner is constructing foreman.

Berkeley.—An acid-proof pump is wanted by F. O. Packard of 2609 Milvia street.

Los Angeles.—The Holden Metallurgical Co. of 521 East 4th street is in the market for a second-hand steam drag-shovel, with 50 to 75-ft. steel boom, 40 to 50 hp., to be complete with cables and mounted on traction wheels, the bucket to hold ¾ to 1¼ cubic yards.

Porterville.—'Magnesite in 1917,' advance chapter of 'Mineral Resources of the United States,' has been issued by the U. S. Geological Survey. The output of Tulare county was 63% (133,347 tons) of the total crude (211,663 tons) magnesite mined in the State and 64% of the calcined product. Twenty-three mines reported production last year. The most productive was the Porterville Magnesite Co.'s property. Its output was greater than in 1916. Two large rotary furnaces calcined over half of the mine's output. The Tulare Mining Co. has two vertical kilns, and calcined its total output. The American Magnesite Co. did custom work, operating two 50-ton rotary kilns.

Portola.—The International Smelting Co. has finally taken over the Walker copper mine. The price was $1 per share for 630,000 shares of the 1,250,000 shares issued. The 90-ton flotation mill continues to work steadily.

San Francisco.—A small electric hoist using alternating current, a compressor, and a machine-drill are required by A. T. McElvaine, care of G. F. Stoner, 984 Market street. This outfit is for prospecting.

COLORADO

Climax.—Mining and milling molybdenite here is described by D. F. Hailey for the Colorado meeting of the American Institute of Mining Engineers. Climax is at an elevation of 11,300 ft., on the D. & R. G. railroad, 14½ miles north-east of Leadville. The main working tunnel of the Climax Molybdenum Co. is at 12,200 ft. Climatic conditions are severe. The American Metal Co.'s engineers examined the deposit first in 1916. Assays varied from 0.4 to 1.2% MoS_2. A ton sample obtained from mine-car samples indicated a recovery of 12 lb. per ton of ore, equal to 0.6%. Milling so far has recovered 0.92%. The ore occurs as an intricate system of fine stringers evenly distributed through the alaskite formation. Oxidation is prominent to 350 ft. below the surface. Iron pyrite and very little copper are the associated minerals. The thin outer edge of the orebody will be mined by open-cut method in the summer, while underground work will be by shrinkage-stopes. In the tunnels, 30-lb. rails have been laid. The ore is dressed by jaw-crushers, ball-mill, crushing through 20-mesh, Dorr duplex classifier, the overflow going to flotation machines, the sand passing through another ball-mill until fine enough for overflow—120-mesh. The flotation plant includes five Janney air-mechanical machines, three Callow standard roughing-cells, and two Callow half-size cleaner-cells. As there is three times as much pyrite as molybdenite, and a concentration ratio of 115 or 120 to 1, the flotation operation is a delicate one. Concentrate averages 65% MoS_2. A new vanner will remove the pyrite and increase the grade of concentrate by 2.2% MoS_2. The mill concentrates 300 tons of ore daily. A year ago Climax was a barren area; by February 1918 the plant was in operation. Comforts of the men are given considerable attention.

Cripple Creek.—The Vindicator Consolidated paid 3c. per share last month, equal to $45,000. This makes $3,757,500 to date. During the second quarter of 1918, there was mined 64,194 tons of ore, yielding 5105 tons of shipping product, including flotation concentrate. Lessees opened a new vein on No. 11 level, giving the company substantial royalties. Net current assets are over $300,000.

Silverton.—Mines that have been idle for years are now being re-opened. Among these one of the most interesting is that of the Veta Madre, one of the oldest claims in the district.——The Bandora will be operated by the owner, William Sullivan, after an idleness of four years.——The Joe and John property, a heavy producer in former years, will be re-opened under lease. At the close of 1917 the mine was in condition for shipping.

The Caledonian mill is being re-modeled, concentrating tables and flotation apparatus being put in.

The Mears & Wilfley company will work its tailing plant on a larger scale than formerly. The Arastra basin, at Waldheim, wherein the Silver Lake properties are situated, will be the scene of considerable activity during this season. In addition to operation of the tailing plant mentioned, many lessees have taken up various properties in the basin, indicating that a large tonnage of lead ore will be mined.

IDAHO

Kellogg.—The Nabob Consolidated on Pine creek is to start shipping 300 tons daily of selected lead-zinc ore. A 4000-ft. aerial tram connects the mine with rail, or where the O.-W. R. & N. line will be constructed. W. A. Beaudry is manager.

Mackay.—On July 1 the Empire Copper Co. paid 5c. per share, equal to $50,000. This makes $100,000 for 1918 and

$880,000 to date, since 1913. Two years production was as under:

Year	Tons	Value
1917	66,807	$1,139,110
1916	69,475	1,380,314

Leasing was eliminated during 1917. There are now 125 men employed, against 225 previously, according to the general manager, F. A. Behling. The mine is worked from tunnels. Present shipments assay 4 to 5% copper, 1 to 6 oz. silver, and 50c. to $1.50 gold per ton. There is a large quantity of 2 to 3% ore awaiting milling. Among the many recent improvements is a 16,270-ft. Trenton-Bleichert aerial tram, replacing a 7½-mile Shay locomotive railroad. This cost $130,000, but will reduce transportation charges by 80%.

Mullan.—The National Copper Mining Co. has completed improvements to its 500-ton mill, which has been operating on a 220-ton basis.

MISSOURI

Joplin.—Production of the region last week was 6463 tons of blende, 53 tons of calamine, and 1668 tons of lead. These averaged $52, $32, and $100 per ton, respectively. The total value was $508,181, making $14,190,051 for 30 weeks. Missouri contributed $159,929 last week.

St. Louis.—The American Zinc Institute adjourned on July 30, after a successful meeting. The final organization committee appointed to formulate plans, constitution, and by-laws, were Victor Rakowsky of Joplin, J. L. Bruce of Butte, E. N. Wolf of Peru, Ill., A. S. McMillan of St. Louis, A. P. Cobb of New York, W. F. Rossman of St. Louis, and C. T. Orr of Webb City, Mo. They have full power to propose all plans for the formation of a permanent organization. These suggestions will be submitted by mail to members for vote of approval within 60 days. It was proposed at the meeting that a research bureau be organized for new uses of zinc. United political action on all laws affecting the industry was proposed, also co-operation in marketing and selling contracts.

MONTANA

Butte.—Zinc concentrate from the Butte & Superior is being sent regularly to the electrolytic plant of the Anaconda company. The reason for this is the restricted quantity accepted by the American Metal Co., namely, 5000 tons per month.

On July 29 a big first-aid field day was held here. There were 19,000 people present. The mines were closed for the day. The committee received entries from the following: Butte & Superior, two teams; North Butte, one team; Elm Orlu, one team; Timber Butte mill, one team; East Butte, one team; Davis-Daly, one team; Anaconda, 29 teams—total, 36 teams. One, two, and five-man problems were worked out. A drilling contest, with $100 and $50 for first and second prizes, was held. C. and J. Bedell won this, drilling 27⅞ inches in 10 minutes. J. Thomas and A. W. Husband were second with 22 inches.

Renova.—Manganese deposits in Madison county, near Cherry and Wigwam creeks and in the foothills east of Jefferson valley, 70 and 30 miles south-east of Butte, are described by J. T. Pardee in Bulletin 690-F of the U. S. Geological Survey. The orebodies are small, but contain ore that is almost free of silica. The manganese is primarily of sedimentary origin. In the Cherry and Wigwam Creek areas the deposits are underlain by dark-brown to light-gray limestone. Not much work has been done, and several hundred tons are available. At the deposits near Renova, the Iron King claim is overlain by limestone. At this and the Iron Blossom claims there is exposed several hundred tons of manganiferous-iron ore and several thousand tons of iron ore.

NEVADA

Nolan.—The Jumbo Copper Mountain company, in the Rand district of Mineral county, has cut the vein on the 380-ft. level of No. 3 shaft. At this depth the rock is a limestone-porphyry contact. Lessees extracted over $80,000 from the east orebody above 150 feet.

Reno.—In co-operation with the American Mining Congress and with the support of numerous Western metal producers' associations, the Governor of Nevada, Emmet D. Boyle, has called a conference of gold-producers and economists interested in the critical situation in which the gold-producers today find themselves, to meet at Reno on August 12, 13, and 14 for the purpose of discussing ways and means to stimulate the production of gold in the face of ever-increasing operating costs which at this time actually threaten the industry in the West.

Virginia City.—Operations on the Comstock lode comprise the following, according to Whitman Symmes: In the Mexican, work is to be started immediately, both north and south, on the 2300-ft. level. This is justified by the work already done from the winze below 2300 ft., which indicates the dimensions and strength of the vein. The work will open ground that is untouched from 2500 ft. to the surface. ——In the Union raising is under way to catch the downward extension of the orebody from 2500 ft., which was strongly outlined in the floor of the 2500-ft. level for a long distance. This ore should be encountered soon, and the south half of the Union mine will be laid open for exploration by the north drift from the 2300-ft. level, now nearing the Mexican-Union line. The face is in ore of good grade and the ground ahead is full of interesting possibilities.——Ore of usual grade is being extracted from several points in Con. Virginia from 2200 ft. up to within a short distance of the 1900-ft. level. There are several other points where ore conditions are promising, from 2200 up to 1900 ft. and above.——In the Ophir work is being advanced as rapidly as possible, and energy is being directed to some promising ground above the 2000-ft. level.

NEW MEXICO

For the first six months of 1918 the output of mines in New Mexico shows small decreases in gold, silver, lead, and zinc, but a small increase in copper, according to Charles W. Henderson, U. S. Geological Survey. The Mogollon silver-gold district continued its activity, as did the Chino and Burro Mountain copper mines. The Santa Fe Gold & Copper Co. was idle. Lead ore from Magdalena fell off, but that from Organ was heavy. At Steeplerock the Carlisle mill is closed. The zinc output of Magdalena was slightly less. Hanover continued production of carbonates and sulphides.

Jarilla.—A concentrating plant is to be erected by J. J. Murray at the Eddy mine.

OKLAHOMA

Picher.—Production of the districts last week was 4193 tons of blende and 1079 tons of lead, valued at $329,916.

TEXAS

The U. S. Geological Survey reports that the Presidio silver mine was in continuous operation during the first six months of 1918, that desultory mining was also carried on during that period in the Van Horn and Sierra Blanca districts, and that several shipments of copper ore were made from deposits in the Red Beds of Foard and Knox counties. The result was a small output of copper and lead, and an output of silver for the six months of fully 300,000 ounces.

Barstow.—Edward Hart of Barstow, and associates, will construct a short railroad to the sulphur deposit in Culberson county that they are developing. They also propose to erect a sulphuric-acid plant.

UTAH

Alta.—The Alta T. & T. Co.'s tunnel was in 3450 ft. at the end of June. The face is in a shale. A promising fissure has been opened.

Bingham.—The Utah Consolidated Mining Co. has started suit against the Utah-Apex Mining Co., alleging trespass and wrongful extraction of ore worth not less than $500,000. The property involved is the Yampa Extension Northeast Lode claim, purchased by the Utah Con. in 1903. It lies above the ground of the Utah-Apex, and is supposed to contain the outcrop of the limestone formation in which Utah-Apex found a large orebody last year. The ore in dispute between the Utah Metal and Utah Con. companies, in the Malloy lime-bed, is now being examined by engineers.

Utah-Apex company pays 25c. per share on August 10. The last distribution was in October 1917.

WASHINGTON

Spokane.—The American Smelting & Refining Co., represented by Preston Locke, has taken an option for $60,000 on three tungsten claims on the Spokane Indian reservation from W. B. Ridle of Spokane and John Van Horn and H. Stiles of the Deer Trail district. The option follows an investigation covering several weeks and has caused much interest in mining circles. The claims optioned are three of several that have been located. The owners have done surface work at many places and have driven two or three short tunnels. The ore is wolframite. There is considerable ore exposed. All these claims are leased from the Indian department.

CANADA

British Columbia

Anyox.—The strike at the Granby Consolidated works here, started by the electric employees, has been called off.

Ladysmith.—The smelter of the Ladysmith Smelter Corporation was to be blown-in on July 29. This was originally scheduled for June 20, but a steady supply of ore could not be arranged until now. The company has a bond on the Willow Grouse mine on Cowichan lake, and the Girtwood mine on Latouche island, near the Beatson mine, southeastern Alaska.

New Hazelton.—A high-grade ore-shoot, 17 ft. wide, is said to have been opened by the Rocher de Boule Mining Co. To find this ore a low-level tunnel was driven without result, but a streak of ore was noticed and it was decided to raise on this. The shoot was found at an elevation of 160 ft. above the main level and, according to report, it has a large prospective value. A mill is to be erected to treat the lower-grade ore.

MEXICO

Nuevo Leon

Monterrey.—A. U. S. Consular Report, dated June 30, contains the following notes on crops in certain States:

Reports from the State of Coahuila would indicate a particularly good wheat crop for the current season. The present price of flour at Saltillo, the capital of Coahuila, is ₱18.75, equivalent to $11.86 U. S. currency, for 112 lb. An exceptionally good cotton crop is also anticipated in that district. The forecast of corn crops in Nuevo Leon and Coahuila is very good, about three times that of the previous year. The present price of corn at Monterrey is $23 U. S. per carga of 138 kg. (304 lb.). It is expected that during the early part of July the price will drop to $21, and continue to drop to $12 or $18. From January 1 to June 30, 1918, there has been brought into Monterrey from the States of Sinaloa, Sonora, Vera Cruz, Mexico, and the United States approximately 15,000 tons of corn. The prospects for the bean crop in Nuevo Leon and Coahuila is also good, 50% higher than in 1917.

PERSONAL

Note. The Editor invites members of the profession to send particulars of their work and appointments. This information is interesting to our readers.

Walter M. Briggs is at Santa Barbara.

A. Garcia is here from Yucatan, Mexico.

J. B. Timms, of Phoenix, Arizona, is here.

R. H. Knapp, of Colorado Springs, is here.

F. A. Beauchamp has gone to Octave, Arizona.

A. E. Hepburn, of Vancouver, B. C., was here last week.

A. G. Charleton is working for the Ministry of Munitions in England.

H. H. Nicholson is examining cobalt and nickel deposits near Leesburg, Idaho.

L. H. Goodwin has entered the employ of Rogers, Mayer & Ball as field-engineer.

C. F. Kelley, vice-president of the Anaconda company, was at the Palace hotel on August 2.

Ernest V. Pearce has returned from the United States to England and joined the firm of W. E. Moulsdale & Co., at Liverpool.

William Wraith, general manager for the International Smelting & Refining Co., will move his office from Salt Lake City to New York.

Thomas B. Stearns, of Denver, Food Commissioner in Colorado, was in San Francisco this week and is now on his way to Salt Lake City.

James S. Douglas is at Jerome, Arizona, on a short visit from France, where he is in charge of the distribution of supplies for the Red Cross.

H. G. D. Reynolds has returned from Siberia, where he was connected with the Irtysh Corporation, Ltd., and will reside in Los Angeles, California.

S. R. Coghlan, formerly assistant superintendent at the Cerro de Pasco smelter, Peru, and more recently a magnesite operator at Porterville, California, has been appointed chief gas-officer at Camp Funston, Kansas, with rank as First Lieutenant.

Obituary

Forbes Rickard Jr., Lieutenant U. S. Army, eldest son of Forbes Rickard, Denver, was killed in action near Bailleul, in France, on July 19.

Henry E. Vail, a pioneer miner of Butte county, California, who also was prominent in organizing dredging companies at Oroville, died at Chester, Plumas county, on July 30. He was born in 1842.

Randolph Adams died at New York on July 9. After graduating from Columbia in '83, he worked at the Silver King mine, Arizona; Broken Hill, Australia; Tennessee copper mine, Tennessee; retiring in 1908. He leaves a widow and two daughters.

John Duer Irving, Captain, 11th Engineers, died of disease in France, according to a casualty-list published on August 1. At the time of voluntary enlistment in the Engineer Officers Reserve Corps he was professor of economic geology at Yale. Born in 1874, he was 44 years of age. A graduate of Columbia in 1896, he devoted his whole career to geology, first with the U. S. Geological Survey, then as professor at Lehigh and Yale universities successively. For many years he was first assistant to S. F. Emmons and co-operated with him in preparing several notable monographs. He was a gentleman, a scientist, and a soldier.

THE METAL MARKET

METAL PRICES

San Francisco, August 6

Aluminum-dust, large and small lots, cents per lb	65—70
Antimony (wholesale), cents per pound	15
Copper, electrolytic, cents per pound, in carload lots	26.00
Copper, electrolytic, cents per pound, in small quantities	27.35
Lead, pig, cents per pound	8.30— 9.30
Platinum, Government price, per ounce	$105
Quicksilver, per flask of 75 lb	$120
Spelter, cents per pound	11
Zinc-dust, cents per pound	17½

The Mint at San Francisco has been authorized to receive crude or manufactured platinum for Government purposes.

ORE PRICES

August 6

Antimony, 45% metal, f.o.b. California, per unit	$1.10
Chrome, 38 to 48%, California, per unit	$1.25—$1.50
Fluorspar, 85% CaF_2, f.o.b. shipping point, or San Francisco per ton	$22—$30
Magnesite, crude, California, per ton (nominal price)	$7.00—$8.00
Manganese, domestic, 35 to 54%, f.o.b. South Chicago, per unit (Government price, effective May 29)	$0.86—$1.30
Manganese, domestic, 35 to 54%, f.o.b. east of South Chicago, per unit (Government price, effective May 29)	$1.01—$1.45
(Manganese, domestic, penalty of 50c. to $1 per ton for 8% and up to 25% silica, and bonus of 50c. to $1 for less than 8 and 5%.)	
Molybdenite, per lb., 90% MoS_2	$1.00
Pyrite, per unit of sulphur, cents	28—32
Tungsten, 60% WO_3, California, per unit	$20—$24

In spite of the urging of the Government that chrome production be increased, producers are having some difficulty in marketing their product.

In describing the molybdenite mine at Climax, Colorado, in a paper prepared for the A. I. M. E., D. F. Hailey says that at present the market for molybdenum is very limited; and the quoted prices ($1.25 per lb. of 90% MoS_2) are nominal, and do not at all represent the prices at which the material is marketed.

'Magnesite in 1917,' advance chapter of the U. S. Geological Survey, has been issued. The output last year was 316,833 tons, averaging $9.15 per short ton. California contributed 211,663 tons, a gain of 37%; and Washington 105,175 tons, against 715 tons in 1916. Consumers of this ore are given in the report.

'Strontium in 1917' has also been published. Buyers' names are given. Celestite prices ranged from $20 to $22 per ton, and for strontianite $35 to $90.

'Cadmium in 1917,' covering output, prices, and names of producers, has been issued by the U. S. Geological Survey.

'Talc and Soapstone in 1917,' giving output, prices, and uses, has been issued by the U. S. Geological Survey.

EASTERN METAL MARKET

(By wire from New York)

August 6.—Copper is quiet, though strong. Lead is scarce and steady. Spelter is inactive and easy.

SILVER

Below are given official (not Government) quotations, in cents per ounce of silver 999 fine. In order to make prompt settlements with smelters and brokers, producers allow a discount from the Government price of $1, hence the lower price. The Government has not fixed the general market price at $1, but will pay this price (as from April 23, 1918) for all silver purchased by it. The equivalent of dollar silver (1000 fine) in British currency is 46.65 pence per ounce (925 fine), calculated at the current rate of exchange.

COPPER

On September 21, 1917, the Government fixed copper prices at 23.50c. per lb. for large lots, and 24.67½c. for small lots, effective until June 1, 1918. On this date the prices were re-fixed until August 15; but on July 2 the price was increased to 26c. and 27.35c., respectively, until August 15. Quotations in cents per pound are as under:

Copper production of 21 of the leading mines in North and South America, accounting for 90% of the total output, yielded 960,640,659 lb. in the first half of 1918, a decline of 27,000,000 lb. when compared with this period of 1917.

LEAD

Lead is quoted in cents per pound, New York delivery. Government metal receives 7c. per lb. until August 6. Early in July producers agreed to fix prices at 8.05c. per lb., New York.

ZINC

Zinc is quoted as spelter, standard Western brands, New York delivery, in cents per pound. On May 25, 1918, the Government fixed prices until September for grade A spelter at 12c. per lb. for itself and the open market. Lower grades can make their own prices as usual. Sheet-zinc is fixed at 15c., and plate at 14c. per pound.

Spelter production and stocks, by grades, as far as available, are to be published each week by C. E. Siebenthal of the U. S. Geological Survey. Such statistics will enable smelters to so gauge their operations as to stabilize the market, and restrain consumers from erratic buying that disturbs the zinc market.

The report by C. E. Siebenthal on the spelter business last year is also to hand. Including small stocks and foreign ore, the available metal totaled 687,428 tons, just 5000 tons more than in 1916, but 177,000 tons greater than in 1915. The apparent consumption was 413,984 tons, a decrease of 44,000 tons. Stocks increased from 17,508 to 53,689 tons. On May 25, 1918, there was 49,798 tons on hand.

Production of secondary zinc in 1917, according to J. P. Dunlop of the U. S. Geological Survey, totaled 116,200 short tons. This was recovered from alloys, brass, dross, etc.

QUICKSILVER

The primary market for quicksilver is San Francisco, California being the largest producer. The price is fixed in the open market, according to quantity. The Government is taking 40% of the United States quicksilver output, paying therefor $105 per flask. Outside of this business the competitive market can make any price as usual. Prices, in dollars per flask of 75 pounds:

Eastern Metal Market

New York, July 31.

The markets are generally quiet. All the metals are strong except one, and two are very scarce.

Copper is now selling only at the price ruling at the time of delivery.

Tin is very quiet and very scarce. The market is unsettled.

Lead continues extremely hard to get with prices virtually fixed.

Zinc is quiet and lower.

Antimony is dull but fairly firm.

The quarterly statement of the U. S. Steel Corporation, issued yesterday, covering the second quarter, is striking testimony to the earning power of a great integrated producer on the present scale of Government-made prices. The net earnings of $62,500,000 in the second quarter, plus nearly $91,000,000 set aside for possible Federal war taxes, makes a total 70% greater than a similar total for the first quarter with its many shut-downs and poor output in January and February. A 10% wage-increase was also announced, which was a surprise to the independent producers. There have been five other 10% advances by the Corporation in the last 30 months and one of 15%, making the new wage 103% higher than that paid on January 1, 1916. A conference in New York on Monday, having to do with increasing the allotment of steel to shipyards, will be developed later this week into a Washington meeting where plans will be made to ensure shipyard work against interruption in the coming year. It was evident from the meeting held on Monday that, however detailed figures might be changed, the main fact was the increasing war-demand for steel, and with it an indefinite but inevitable reduction in the amount for other uses.

COPPER

The meeting next week, August 7, in Washington is almost the sole topic of conversation. One still hears confident talk of a 27.50c. price to be effective after August 15, to continue to January 1, after which 30c. per lb. is mentioned. No one, of course, knows what will result, since the War Industries Board is not divulging its attitude. Until this event is past the market is merely marking time, but it is strong. Where sales are made it is done only with the understanding that the price be the same as that ruling at the time of delivery. It is reported that the volume of business done is not large, especially for delivery before August 15, since the producers seem to prefer to wait, and perhaps to increase stocks. Consumers are, however, reported as well covered at least to August 15. The output of refined copper is now regarded as being at the rate of 210,000,000 lb. per month, which contrasts with 203,000,000 lb. per month in 1917. During the first five months of 1918 it was not over 190,000,000 lb. per month.

TIN

The tin market is the same old story—no business and no offerings. This is due, almost wholly now, to the new rulings referred to last week, which state that sellers in the Far East cannot do any business except under license from the Federated Malay States government. There has been no further explanation of this. Most importers and dealers do not know where they stand. A few lots have been offered and sold in the past week, but there was not more than a half dozen of them. Opinion is to the effect that this was done to test the new scheme. There is a pronounced scarcity of all grades of tin. For spot delivery in New York the quotation is still nominal at 94c. per lb. Buyers are not anxious and are apparently willing to let events take their course. Arrivals at Pacific ports continue large. For the month to July 27 they have been 5260 tons, with those at Atlantic ports 775 tons to July 24. The London market is again higher. Spot Straits is now higher than at any other time, or £385 per ton. A week ago it was £365 10s. per ton.

LEAD

There is no change in fundamental conditions. Very little business is reported and very little is possible, due to the continued scarcity of the metal. Another hindrance to transactions is the fact that the question of freight rates to other points than New York is still unsettled. The market is really nominal, but firm, at 7.75c., St. Louis, or 8.05c., New York. Spot metal is unobtainable, and practically none is available for August delivery. This refers to carload lots and larger. For less than carload lots, up to 8.75c. per lb., New York, has been obtained, but the understanding is that no metal is to be sold in carloads for any higher price than 8.05c., New York. Japan is said to be still in the market.

ZINC

Demand continued very light but a small amount of business is reported. The tendency downward, noted the past two weeks, has continued, and today the market is quoted at 8 to 8.12½c., St. Louis, or 8.25 to 8.37½c., New York, for prime Western for early and third-quarter delivery. At these levels the small transactions noted have been done. Fundamental conditions are regarded as strong. One beneficial result of the reactionary tendency is pointed out as the probable prevention of the resumption of production by some smelters who shut down when the market was much lower. A continued advance probably would have increased the output. As it is now, demand and supply seem to about balance. A feature is the issuing of weekly reports by the Government showing the output of various grades of zinc. Grade A, with a maximum price of 12c. per lb., is reported as having sold recently considerably below this. Sheet-zinc is fixed at a minimum of 15c. per lb. with plate-zinc at 14c. per pound.

ANTIMONY

For prompt and early delivery of 25-ton lots 13 to 13.25c., New York, duty paid, is the quotation, with the market quiet and dull. An interesting statement is to the effect that a duty of 7c. per lb. is being considered seriously as an incentive to production in this country. Imports have been large. For the 11 months ended May 31, 1918, the imports of metal and regulus were 38,148,949 lb., as against 22,604,460 lb. for the same 11 months in 1917.

ALUMINUM

Government maximum prices control the market for No. 1 virgin metal, 98 to 99% pure and for scrap. These are 33c. per lb. for 50-ton lots, 33.10c. per lb. for 15 to 50-ton lots, and 33.20c. per lb. for 1 to 15 tons.

ORES

Antimony: No business is reported, quotations remaining unchanged and nominal.

Molybdenum: The nominal quotation continues about $1 per lb. of MoS_2 in 90% material, with very little demand.

Tungsten: The market is firm at $20 to $24 per unit for 60% concentrates, with the higher grades commanding $24 to $24.50. A fairly active market for the past week is reported. Ferro-tungsten is quiet, and largely nominal, at $2.40 per lb. of contained tungsten.

INFORMATION FURNISHED BY MANUFACTURERS

The B. F. Goodrich Rubber Co., in a recent circular, affirms that when humanitarian principles govern the relations between employer and employee, the utmost efficiency of man-power is obtained. It is the tonic for creative force. In a prize essay by L. M. Barton he says: "One of the most humane, and therefore one of the best employers in America, is my own, the B. F. Goodrich Company. Of its army of 22,000 workers almost 20,000 are employed in the company's big Akron, Ohio, factories. The remainder are in 125 big cities. The company occupies a high place in the rubber industry. Our big factories work 24 hours every day for six days of the week. Three shifts keep the crude rubber going in at one end and the finished products coming out at the other. Each shift works eight hours per day. Saturday night at 11 o'clock the factories close and do not re-open until midnight Sunday. The Goodrich company believes that the best employee is the man who is as free from worry as it is humanly possible to make him. Three months from the date when he begins to work each employee receives gratis, a life insurance policy for $500, in favor of any beneficiary he may designate. This policy is increased $100 each year until it reaches $1000. Literally speaking, almost as soon as a man begins to work for Goodrich, he is worth $500 more to his dependents than he was before. Employees' policies are covered by a group-plan life insurance, placed with the Equitable Life Assurance Society. When the legislature of the State of Ohio enacted its workingmen's compensation law a few years ago, it used as a basis the idea contained in this Goodrich plan, adopted more than 20 years previously. If injured during work, the company supplies all necessary facilities and pays for medical or surgical attention. If injured anywhere during unemployed time an employee receives the same compensation. In no instance is the employee required to contribute to this insurance. Compensation for an unmarried man amounts to one-half of his average weekly wage or salary, but if married, or contributing regularly to dependents, he receives two-thirds. This applies to women as well as to men. The Goodrich company realizes that it is often necessary to employ married women for some classes of work and in such cases pays disability compensation for 8 weeks preceding and for 13 weeks following the birth of a child. The only provision is that a woman must have been in the employ of the company for the preceding 12 months. In addition to these features those men and women who have served the company faithfully are retired and pensioned when they reach the ages of 70 and 65 years, respectively, regardless of the number of years they have served the company. These pensions vary according to the number of years of service, but none are less than $20 per month, and none exceed $100 per month. The personal safety is ensured by modern safety devices throughout the plants. This system is so perfect and accidents are otherwise so well guarded against that a fatal accident is rare. Not one occurred during the entire year 1917. In social and educational matters the Goodrich company is doing more than any employer I know of. The company maintains a free school under capable instructors. In it are enrolled 1240 pupils, ranging from 18 to 50 years. Here men and women of 30 nationalities are taught English, arithmetic, writing, history, civics, mechanical drawing, spelling, physiology, commercial geography, French, Spanish, and Russian. Within the past 10 months alone 150 foreign-born students have become American citizens, and a total of 450 have become naturalized. For its girl employees the Goodrich company several years ago acquired a tract of 44 acres of land bordering a small lake within a few miles of the city, and established a clubhouse and recreation park. The cost of these things is justified by the results that are obtained. If people are to be efficient and loyal workers they must be happy, and the cost of this happiness comes back to the company in the form of better goods for its customers."

The Case Manufacturing Corporation, a concern with closely held stock, has just organized for business at Denver. It will manufacture oil-burners, oil-furnaces, and kindred apparatus. The Case oil-burner is well known, having been in general use among assayers for many years, and has an established reputation for reliability and economy. The late W. W. Case, the inventor of the oil-burner that bears his name, had specialized on oil-furnaces, and the Case Manufacturing Co. will make a full line of this equipment, such as oil-fired tilting crucible furnaces, muffle and roasting furnaces, as well as oil-fired furnaces adapted for the heat-treatment of various metals and for heating steel for forging. The active men in the organization are Fred McL. Strout, vice-president and traveling representative; Theodore W. Muckle, treasurer and factory manager; and Seth Parlin, secretary. In addition to the appliances mentioned above, the concern will deal in metallurgical clay goods, and apparatus for assayers, metallurgists, and chemists. The staff includes experienced engineers and metallurgists who will be glad to advise customers of the house in regard to furnace equipment for specific purposes.

The Wellman-Seaver-Morgan Co., of Cleveland, Ohio, has issued a bulletin on coke-oven machinery. It gives representations of the latest practice, such as the combined coke pusher and coal-leveler as used in the Semet-Solvay by-product ovens in its great plants at Detroit, Buffalo, Cleveland, Syracuse, and other points. These appliances are also used by the Bethlehem Steel Co., National Tube Co., Youngstown Sheet & Tube Co., and all the leading makers of by-product coke. Each machine is capable of serving 100 ovens. They are very simple in construction, considering the various functions they have to perform. The bulletin also shows accessory equipment for coke-oven operation, such as door-lifters, coal-charging larries, and door-extractors.

The Chicago Pneumatic Tool Co. announces the appointment of L. C. Sprague as special representative in connection with the sale of pneumatic tools to railroads. Mr. Sprague was formerly connected with this company, but more recently has been with the railroad department of the H. W. Johns-Manville Co., New York.

NOTES 205

THE ACCOUNT 207

From the casualty lists, America is now beginning to realize that many sacrifices are being made in the great struggle in Europe. The reasons why the United States is fighting are clear. The instigators of the War must be brought to account. M. & S. P., August 17, 1918.

FOOD ADMINISTRATION 208

A review of what the Administration has done since America entered the War, and a eulogy of Mr. Hoover's efforts. Being a mining engineer, all in the profession are proud of his organizing ability. At present over 30% of our exports are foodstuffs; in 1914 they totaled only 9%. M. & S. P., August 17, 1918.

DISCUSSION

THE STATUS OF GOLD MINING

By Albert Burch 209

The California Metal Producers Association does not consider that a bonus on gold would be of permanent benefit, also that there can be no excess profit in gold mining as a result of the War. M. & S. P., August 17, 1918.

THE MARKET-VALUE OF GOLD

By W. de L. Benedict 210

Calculations showing the value of gold in the United States and England, and why it was fixed at $20.67 and £4 4s.11.45d. per ounce. M. & S. P., August 17, 1918.

THE STATUS OF GOLD

By Blamey Stevens 210

If the value of gold were altered, foreign countries might lose faith in the value of the dollar. M. & S. P., August 17, 1918.

ARTICLES

LIEUTENANT FORBES RICKARD, JR 211

Biography of an excellent young American, who gave great promise for the future, a victim of the War. His poem giving expression to great ideals is re-printed. M. & S. P., August 17, 1918.

PHYSIOLOGICAL EFFECTS OF GASES ON MAN 212

Certain gases in the atmosphere, above or below normal quantities, result in distress and even death to miners; other gases are practically inert. Carbon monoxide is one of the worst gases to contend with. M. & S. P., August 17, 1918.

TUNNEL-BLASTING AT CHUQUICAMATA

By E. E. Barker 213

Ore-reserves of this great property total 700,000,000 tons, and the daily production is around 10,000 tons, eventually to be increased to 30,000 tons. A large quantity of overburden is also removed. Blasting churn-drilled holes became too expensive, especially in a bench 180 ft. high. Tunnels driven into the deposit, charged with dynamite, and then exploded, is a much cheaper method, being less than half the cost of churn-drilling. Useful data are given on charging and electric wiring. M. & S. P., August 17, 1918.

THE DUTY OF THE EMPLOYER TO THE CRIPPLED SOLDIER

By Douglas C. McMurtrie 224

The maimed fighter must be trained for some vocation suitable for his condition, then employers must find him something whereby be gives valuable aid, not simply a make-shift job. M. & S. P., August 17, 1918.

SALINE DOMES AND OTHER SALT DEPOSITS

By Kirby Thomas 226

General conclusions regarding the salt deposits of western Virginia. M. & S. P., August 17, 1918.

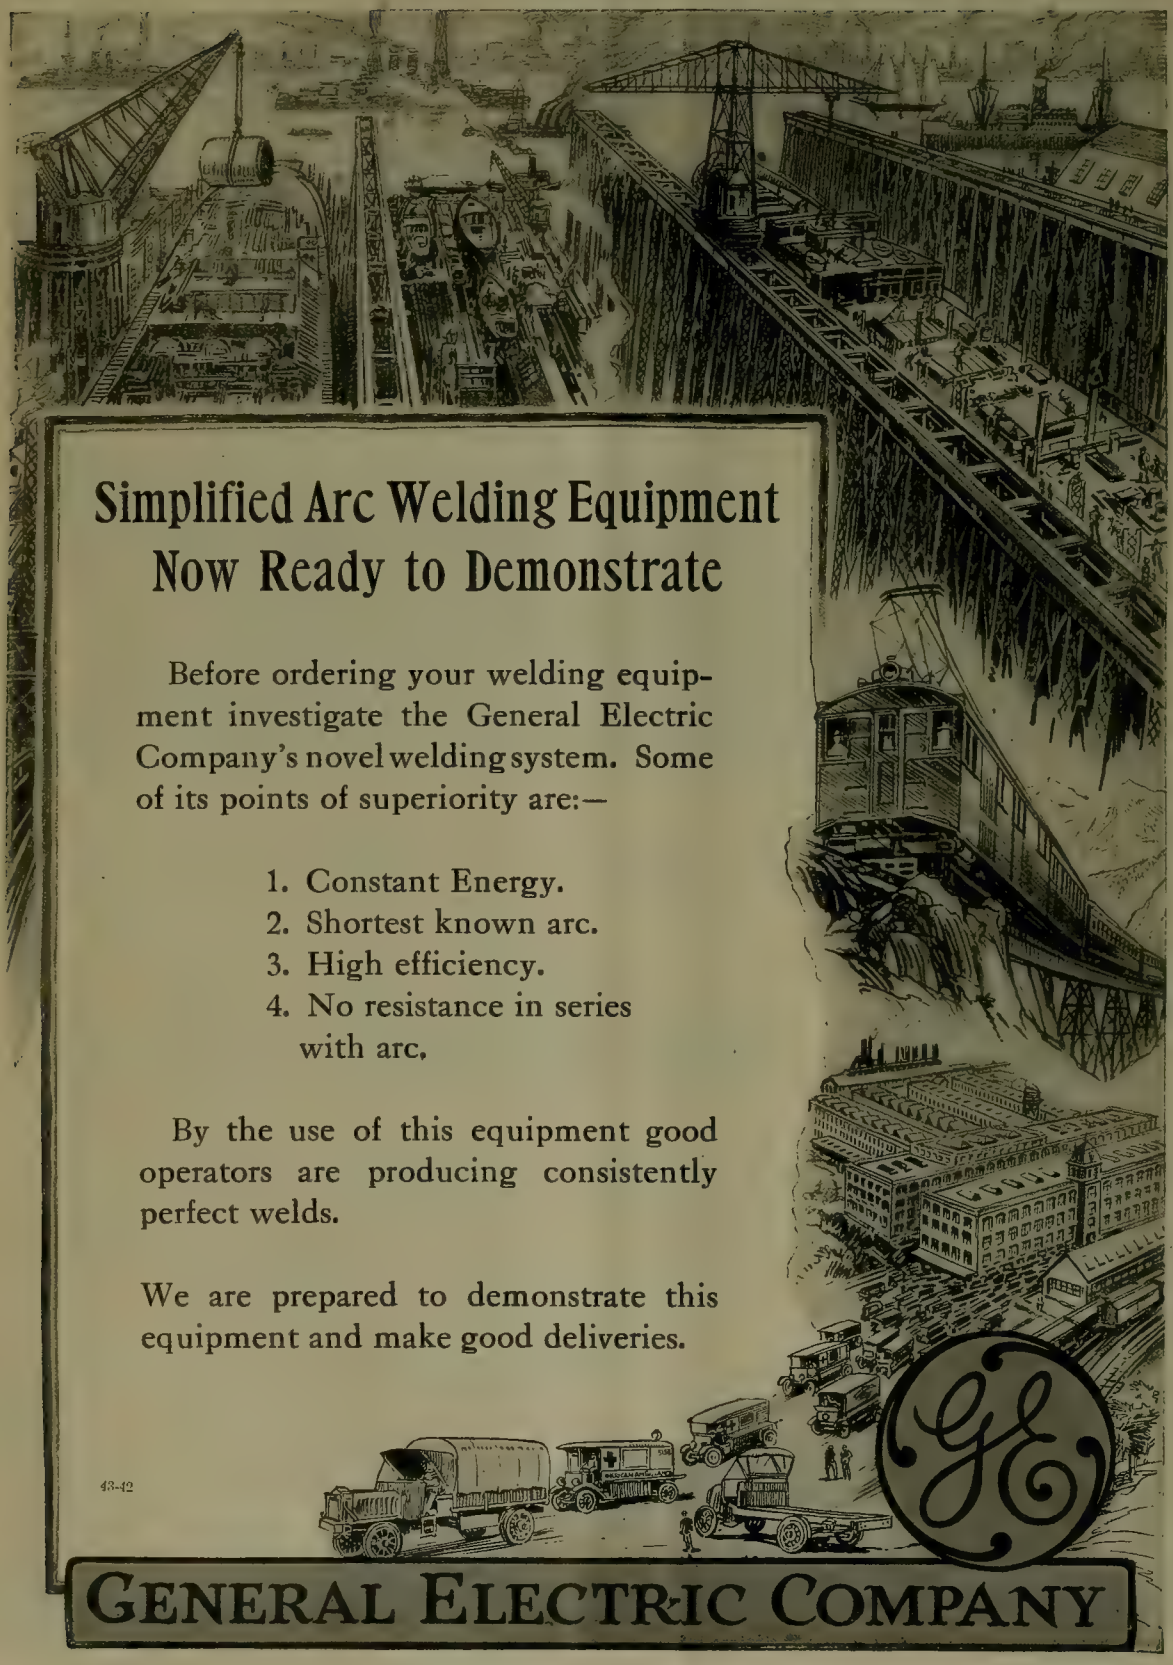
Entered at the San Francisco post-office as second-class matter. Cable address: Pertusola.

Branch Offices—Chicago, 600 Fisher Bdg.; New York, 3514 Woolworth Bdg.; London, 724 Salisbury House, E.C.

Price, 15 cents per copy. Annual subscription, payable in advance; United States and Mexico, $4; Canada, $5; other countries in postal union, 25s. or $6.



Simplified Arc Welding Equipment Now Ready to Demonstrate

Before ordering your welding equipment investigate the General Electric Company's novel welding system. Some of its points of superiority are:—

1. Constant Energy.
2. Shortest known arc.
3. High efficiency.
4. No resistance in series with arc.

By the use of this equipment good operators are producing consistently perfect welds.

We are prepared to demonstrate this equipment and make good deliveries.

43-42

GENERAL ELECTRIC COMPANY

THE Federal Trade Commission now issues a summary of complaints made to it and of orders made by it. This is a useful kind of publicity, for it places wrong-doers in the pillory of public opinion.

SMALL producers of quicksilver are complaining of the delay in payment on shipments. The Navy department, as agent for the Government, is buying 40% of the output at $105 per flask. Deliveries made in April and May are said to be awaiting settlement.

A CONFERENCE to discuss "the gold stringency" is to be held at Spokane on September 2 and the five days following under the auspices of the Northwest Mining Association. A committee consisting of Messrs. F. A. Ross, A. W. Boyd, F. C. Bailey, and S. Norman will arrange details.

NOBODY should have been surprised that the War Industries Board decided to enforce economy in the use of paper; on the contrary, it is surprising that this measure of disciplinary reform was so belated. No waste is more obvious than the waste of paper by our newspapers, particularly in the Sunday supplements, with their mass of piffle and misinformation. We are thinking, of course, of our local papers, not of the New York 'Times,' Boston 'Transcript,' or other newspapers of the first class.

AMONG the articles listed by the Department of State for export to Mexico, in addition to certain foods, are all kinds of mining machinery, tools, manufactures of iron, steel, copper, and zinc, cyanide, dynamite, caps, and fuse. This order was issued at the request of President Wilson as an evidence of goodwill toward our neighbor on the South. We understand, nevertheless, that difficulty is experienced in some parts of Mexico in securing the necessary co-operation of local officials in obtaining permits to import explosives into the country.

CHARLES SCHWAB may lack the refinement that we consider as much the prerogative of a democrat as of an aristocrat, but his driving power and executive ability are qualities fitting him peculiarly for his great work as director-general of shipping. He knows how to appeal to the workers, as is shown by a photograph in which he stands smiling with his arms around the shoulder of Mr. Bert Myre, the champion rivet-driver of the Pacific Coast. The picture expresses the solidarity of a democratic people in a manner to gladden the heart of all good citizens.

COMPLAINTS reach us regarding payments made on copper ore shipped to smelters by small producers. For instance, on July 20, the American Smelting & Refining Co., when returning a number of settlement-sheets, wrote as follows to the El Tiro Copper Company at Silverbell, Arizona: "You will note that we are settling this lot based on 23½ c. copper, as we have no official advice from the Government of an increase; however, adjustment will be made later according to Government advice." The agreement to raise the price to 26 cents was made on July 2, eighteen days before the date of this note. The smelting company's headquarters at New York must have been informed within an hour. The refusal to settle on the new price is justifiable legally, but it looks like a technicality, likely to irritate, as it did. On July 2 the same company had nearly 100,000 pounds of copper, some of it unsampled, at the smelter. On this the smelting company paid at the old (and lower) rate, claiming that its date of settlement is the day on which the ore is received and not the day on which payment becomes due. This is the sort of thing, of course, that causes a sentiment of dislike against the powerful smelting combination. It is to be brought before the Federal Trade Commission, and we hope that the result will be the establishment of a basis for settlement fair to all concerned.

QUOTATIONS for chrome ore have been weak and erratic, causing anxiety in California, where the exploitation of deposits of this mineral has attracted much interest recently. We are informed by the Committee on Geology and Mineral Resources of the State Council of Defense that there has been an attempt to discount the established price, accompanied by rumors that the market would be affected by importation from Cuba, and that steel-makers had decided to replace chrome with manganese. There is good reason to believe that the depression in the chrome market is artificial and temporary. The Committee anticipates no reason for a decrease of consumption or for a curtailment of production, and all producers are advised to continue active develop-

ment. It is unfortunate that members of the U. S. Tariff Commission recently in San Francisco, to afford hearings on the status of tungsten, quicksilver, and antimony, did not make a similar inquiry into the chrome industry. The vagaries of the market and the apparent attempts to manipulate prices indicate the urgent need for the establishment of a Minerals Administration able to exercise salutary supervision.

WE note with pleasure that Secretary Lane has written a letter to the chairman of the Ways and Means Committee of the House of Representatives deprecating "the effect of the excess-profits taxes on the production of certain minerals essential for carrying on the War" and suggesting care in assessing taxes so as not to kill these industries. He mentions "the fact that new mining enterprises of uncertain life are not allowed to amortize the actual investment before becoming subject to the excess-profit tax." This is due to the custom of regarding dividends from mines as income, whereas, as a matter of fact, most of them represent the return of capital. It is only when the mine has redeemed its capital that its dividends are real profit on the 'investment,' or speculation, as we prefer to call it. A mine is a wasting asset and until the yield from it has more than amortized the money sunk in the enterprise it is not a profitable venture, except for those that meanwhile use the stock as a counter for a gamble, selling it for more than they paid for it and for more usually than it is worth.

UPON another page we publish an article on the duty of the employer to the crippled soldier. It is well that the public should face this obligation now that the casualty lists are making us realize the sacrifice offered for our country by the brave fighters at the front. Congress has taken the matter in hand, delegating to the Federal Board for Vocational Education the great task of rehabilitating our wounded soldiers and sailors. Experience in Europe has shown that over 80% of the permanently disabled men can be trained for useful, self-sustaining, and wage-earning employment, rendering them serviceable not only to release able-bodied men for the front, but also for the great work of civil readjustment that must follow the cessation of hostilities. Such training will preserve the self-respect of men whom we respect greatly. In the article by Mr. Douglas C. McMurtrie, this purpose is explained on behalf of the Red Cross Institute for Crippled and Disabled Men, in New York. The managers of mines and mills should be prepared to assist, since at any large mine or mill there are jobs particularly suitable for honest and reliable men that are incapable of active movement, such as watchmen, switch-tenders, samplers, book-keepers, warehouse clerks, and weighers. This work should be of immediate interest to every citizen; to vote pensions is not nearly so helpful as to assist a man to be independent; we must see to it that our champions returning battered from the conflict are not reduced to semi-mendicancy or to unhappy idleness; in short, those who have not been privileged to bear arms for their country must do an act of justice to the men that have borne the brunt of the fray.

IT will be interesting to see what effect may be produced in Mexico by the announcement that Carranza proposes to offer himself for a second presidential term. When gentlemen in the Latin countries ride into office on the wings of a revolution there is no equation known for finding the *n*th term. That is a fertile excuse for fresh revolts. Carranza triumphed on a revolutionary program the chief planks of which were the vindication of the constitution of 1857 and the principle of no re-election. We have seen the constitution swept aside by a radical document, socialistic in its provisions, with loop-holes that admit of maintaining an actual autocracy; now the doctrine of succession is about to be violated. News of the persistent activity of revolutionary bands leaks across the border at intervals, but it is not generally realized that these pertain to a fairly well organized movement of which Felix Diaz is the acknowledged head. The uprising in Nuevo Leon under Eduardo Martinez and that of Juan Cabral in Sonora both are connected with the Felicista party. Martinez is a lawyer of ability and good reputation; Cabral distinguished himself as a general in the previous Constitutional struggle, and is favorably known in this country as a graduate from an American university. It is a pity that Carranza should not make it easy for such men, possessed of personal bravery and intellectual strength, to take an honorable part in the reconstruction of the country. Our Government is endeavoring to help the administration in Mexico to work out its problems, and one of these is to re-establish the guarantees of civic liberty, so as to make revolution more difficult and wholly reprehensible. It is an error to regard Mexicans as predisposed to military uprisings. Those who know them best are aware of the fact that they are a singularly litigious people, and the tendency to carry their grievances into court argues an inherent respect for law. On such a national characteristic it should be possible to build a solid civic structure, and to put an end to internal strife. First, however, confidence in the administration must be created, and this cannot be done by breaking promises.

ELECTROLYTIC zinc is of higher grade than the redistilled, and at an equal price it is preferable. The War has resulted in establishing some new standards, and the manufacturers of brass have had the desirability of high-grade spelter forced upon their attention. Consequently it is anticipated that they will continue to demand it in preference to 'brass special,' and that the price of 'prime Western' will be regulated by the higher grades as the production of these increases. The requirements of the Government are for zinc containing not more than one-tenth of 1% of impurities, with narrow limits fixed for the lead, iron, and cadmium, and it appears that many distillers are able to meet these specifi-

cations. Outside the particular market for military uses a premium can be obtained for electrolytic zinc. A considerable demand exists for an exceptionally pure metal in the chemical industry and in the manufacture of ornamental and of some special bronzes. Also the makers of manganese-bronze are willing to pay a higher price. A considerable future for electrolytic zinc is seen in the development of zinc wire, zinc tubing, and other new applications of the metal that the extreme purity of this product renders possible. The present opportunity for the zinc-producers is to take advantage of the extraordinary consumption of the other metals for munitions to enter industrial fields thus vacated temporarily and to demonstrate the fitness of spelter to persist as a competitor in these uses after the War. Nothing is more valuable for any industry than to face circumstances that stimulate ingenuity, and this chance to substitute the cheaper metal for those that are always more costly may prove in the end a greater boon than the absorption of larger quantities for a brief period at better prices. The effect of the huge demand in 1915 was reflected in the increase of smelting capacity from 115,114 retorts at the close of 1914 to 218,000 at the present time. Under the spur of exorbitant prices the furnace capacity of the country grew 14% in the first six months of 1915. Today 40% of the retorts are idle. The fact that Australian zinc concentrate was smelted largely in countries dominated by the Germans after the invasion of Belgium, played into the hands of American producers, but Australia has again entered the lists and the smelting of the product will continue under British control in future. Accordingly, the response made in providing additional plant under the stimulus of war at the beginning has left the Americans in a position to take advantage of every opening for selling high-grade zinc, and to encourage its use in place of the lower grades at prices commensurate with the advantage it offers the consumer. Thus a large part of the excess smelting capacity eventually may be utilized advantageously. There has never been a more favorable set of circumstances for expanding the application of zinc, and such efforts as are being made by offering prizes to promote invention with that object in view will tend to convert the momentary difficulties into a permanent improvement of the status of zinc mining.

The Account

The casualty lists are lengthening; daily we are becoming more proudly conscious of the part that our country is taking in the great contest overseas; it is brought home to us not only by the splendid record being made by our Army but by the loss of those dear to us. Even among those least sensitive to the calamity that has darkened the world for four long years, even among those curiously detached persons to whom the war in Europe has been chiefly a tremendous spectacle, even to the selfish and the callous, the grim reality of events is being visualized by the list of names on the roll of honor. Every one of us now has been awakened to a realization of the cost, not in money, ships, or guns, but in warm human blood, and that realization has stirred our feelings as never before. To the intelligent, such as the members of the mining profession, the keen interest in events has been deepened by sorrow, as friends and relatives have made the supreme sacrifice. Such sorrow has given way to another feeling, one of anger that the flower of our youth, the pick of our race, should be sacrificed to the criminal aggression of the Prussian, the beast with the brains of an engineer, who provoked the suicide of civilization under guise of a campaign for his vaunted 'kultur,' the creed of a thinly veneered barbarism that disregards every law of God and man. We did not start this thing; we kept out of it until patience ceased to be a virtue; we went into the war to prevent the wrecking of civilization, to throw our strength on the side of the oppressed, on the side of right, against the great military machine that threatened to put all nations of the earth under its savage heel. Our loss will not weaken our purpose, but, as we learn of the death of those we love, we lift a clenched fist and call to account the men responsible for this carnage. The story is told that a blacksmith on the Scottish border had a young assistant named Jock, who volunteered for active service promptly. A few months later a friend came to the blacksmith and said: "D'ye ken that Jock's been kilt?" To which the other replied: "Aye, mon, he's been kilt!" The burly blacksmith tore his apron off and with clenched fist exclaimed: "Then somebody will have to accoont to me for thaat!" Does not this story express our feelings today? We are fighting to keep the world safe for democracy and for the right to live in our own way, free from the hectoring of a military caste without the sense of honor, but are we not fighting also to bring somebody to account? Is not our sense of justice outraged? Shall the murderer go free and the pirate pass unpunished? No! The memory of the brave and the innocent makes an appeal more thunderous than the howitzers. There must be an accounting for this ineffable crime. We know who is responsible. The doubts of the judicious have been swept aside by evidence so damning that rebuttal is impossible. The memorandum by Lichnowsky, Germany's ambassador at London, has given away a case that was black enough on the circumstantial evidence four years ago. The confessions of Mühlon, the Krupp director, of Thyssen, the steel manufacturer, and the statements made by Wangenheim, the German ambassador at Constantinople, to Mr. Morgenthau, our representative at the Porte, are in the testimony recently made public. All of it proves beyond the shadow of doubt that this war was the immediate result of a conspiracy between the autocratic governments of Austria and Germany, and that Germany pushed Austria into the opening fight in order to carry out a scheme of conquest carefully devised, the sequel to forty years of preparation, by means of a propaganda to which the German people proved receptive in the hope of national aggrandizement and economic gain. The Hohenzollerns and the Hapsburgs, with their military castes,

impressed their will on peoples debauched by the hope of political and commercial gain, using them as pitiable tools for their astounding crime. The assize of history will not hesitate to convict the instigators and perpetrators of this bloody offence. The paranoiac Kaiser and the successor to his wretched old partner at Vienna, their crafty chancellors and their unscrupulous chiefs of staff, each is known by name, and each must be brought to account. When that time comes, for which the armies of the Allies are now fighting unceasingly, their dupes, the peoples of Germany and Austria, will be arraigned also as *participes criminis*. They cannot be punished individually; it is not necessary that they should be, for their own deeds are their doomsmen, they are destined to drink the dregs of sorrow and the bitterness of defeat; they will bear a burden for generations to come. They will be punished sufficiently; but if justice is to be held in honor on the earth, let us see to it that the principals are brought to personal account and punished to the uttermost, so that they will be unable to commit a similar crime again and so that no other men like-minded will ever dare to imitate their vile example.

Food Administration

Members of the mining profession have taken a keen interest in the effort to conserve and regulate the supply of food for the use of our own people and for that of our Allies; they have been keenly interested not only as good citizens but on account of their goodwill to the Food Administration. Mr. Hoover has awakened the most friendly feelings from all of us, because he is a mining engineer of extraordinary executive ability and because he did such a splendid thing in organizing the Commission for the Relief of Belgium. He abandoned a highly lucrative profession and business, as engineer and financier, in order to throw himself with all his heart and strength into a systematic effort to aid the first victims of German brutality, the gallant defenders that held the bridge against the oncoming swarm of gray despoilers. We admired him for that and for the immediate success that he achieved in feeding the starving Belgians, particularly the children. A typical American democrat, he met the big men of Europe and held his own with them in a contest of wits and resourcefulness. We liked that. Therefore it seemed good to us, of the mining profession, that he should be selected by the President as the head of a Food Administration for the United States. Again he has made good, and we rejoice that he should have done so unmistakably. No branch of the Government during the period of this war has been as cordially supported by the public as the Food Administration. From the first, Mr. Hoover appealed to the sense of honor, to the loyalty, to the unselfishness of the ordinary citizen. His confidence in the mass of the people has been justified to the hilt. The requests, regulations, and edicts of the Food Administration have been received not only with docile compliance but with enthusiastic co-operation. The results are eloquent. Early in 1917 the Food Controllers of our Allies asked for an additional 75,000,000 bushels of wheat; we shipped to Europe nearly 85,000,000 bushels before the close of the fiscal year. At the time they asked for this aid our own surplus was more than exhausted; the year before we had exported the surplus of 200,000,000 bushels to our Allies; in 1917 there was only enough for our normal consumption; therefore the shipments to Europe represented the savings from our own wheat-bread. Despite a much increased average of corn-land in 1917, the crop of corn was below the average. "The total nutritional production of the country for the fiscal year was between 7 and 9% below the average of the three previous years, our nutritional surplus for export in these years being about the same amount as the shrinkage last year." So says Mr. Hoover himself. This shows how greatly the consumption and wastage of food must have been reduced. In meats and fats the United States, in the fiscal year ending June 30, 1918, sent to the Allies 844,600,000 pounds more than in the year previous. The following figures speak for themselves; they represent exports to Allied destinations in the year ending June 30, 1918, and in the year ending June 30, 1914:

	1918	1914
Beef, pounds	522,291,807	33,225,111
Bacon, pounds	815,319,424	193,964,252
Condensed milk, pounds	529,750,032	16,209,082
Flour, barrels	21,880,151	11,821,461
Grain, bushels	219,472,813	112,500,360
Ham, pounds	419,571,869	165,881,791
Value	$1,055,955,820	$210,509,180

In May and June the foodstuffs cited above represented exactly one-third the value of all our exports, whereas in 1914 they represented only 9% of the total. About 85% of our recent exports of flour have gone to England, France, and Italy, as against 24% in peace times; of our meats, 80% has gone thither, as against 16% formerly. These increases represent the feeding of our Allies and of our own army and navy in Europe. In his recent speech at the Mansion House, in London, Mr. Hoover said, "We are sitting at a common table." The Big Brother has shared his heaping plate-full with the other members of the family, including the Mother Country with whom he had a quarrel once upon a time. Nothing has so testified to the disinterested spirit of the United States in entering the War as this willingness to share food, without any question of profit arising. The greater sacrifice of life for the Cause is now being made with equal wholeheartedness. We sit not only at a common table but we stand reverently at a common grave, and from the sharing of this common experience shall come an understanding and a sympathy with England, and with France and Italy, such as shall cement the nations into a league for peace more effectively than any agreement on paper. When the historian looks back upon these calamitous years he will recognize the far-reaching effect of the international benefaction with which Mr. Hoover has been identified and he will appreciate the enormous advance in social feeling engendered by the national and international sharing of food, as carried out under his effective administration. Not all the victories of war are on the battlefield.

The Status of Gold Mining

The Editor:

Sir—In your issue of July 27, under the heading 'The Menace to Gold Mining' there was published a statement to the effect that the California Metal Producers Association had endorsed the plan for paying a bonus of $10 per ounce as a minimum in addition to the regular rate of $20.67 upon gold produced in the United States.

This statement I believe to be erroneous, as no action was taken by the Association on this question except at a meeting of the executive committee which was held on July 24. At that time the whole subject was discussed and the committee was unanimous in its opinion that it would not be of permanent benefit to the gold-mining industry of California to advocate the payment of such a bonus. Suggestions for principles which should govern the taxation of gold mines were approved by the executive committee and our representatives in Congress have been asked to favor them, as follows:

"In any mine taxation, account must be taken of the following points:

1st. As regards gold mines, there is and can be no excess profit in gold mining as a result of the War, since the price of the output is fixed, while the price of supplies and labor has risen. As a matter of fact, profits in gold mining have decreased as a result of the War.

2nd. With regard to all mining, including that of gold: Account must be taken of the fact that a mine is a wasting asset. Each year as ore is taken out the total amount available is decreased by that much. Each mine has a fixed life. The nominal return for a year is therefore, in fact, largely a return of the principal involved in the operation until the total of such returns serve to extinguish said principal. Any just system of taxation must therefore take into account and allow for an adequate depletion charge to cover exhaustion of gold reserves.

3rd. Not every prospect makes a mine, and in order to keep development of mines going, it is necessary to spend money on prospects, many of which yield no return. In order, therefore, to keep development going, it is necessary that the mine which does prove profitable shall pay a sufficient return to allow for writing off the unprofitable work. The 8% return allowed by the present law as an average for all industries is not sufficiently large to do this. It is probable that other industries have similar problems and to secure justice the fixing of the return for each industry, or club of industries, should be a matter of expert determination. No single rate for all industries in America can be a just or fair rate.

4th. Mining men have no disposition to avoid fair taxation, and for the period of the War will willingly submit to any taxation of true excess profits that Congress may consider necessary. It is important though that only the real excess profits should be determined. The British system of measuring such excess by the returns of the current year against the average for the period of 3 years preceding the War is defective, in that this does not take into account new producers which were not being called into being by the War. As an example, a gold-dredging company may be cited. Such a company may have worked several years drilling its ground and building its machinery with no return. It has happened that a number of such companies have only come into production since the War started. Under the British system any return which they now make is an excess return. As has already been shown, this is not true and in fact may really represent a returned principal which may never amount to the total involved in the enterprise."

The above suggestions were not original with any member of the executive committee, but were those which had been advocated by officials of the Bureau of Mines and under the circumstances seemed so fair that their adoption is urged by the California Metal Producers Association as a partial relief to the ills from which gold mining now suffers. On the other hand, it was felt that the payment of a bonus at this time, even if such payment could be obtained, would result in great damage to the business, when the time should come for the inevitable readjustment to normal conditions. Furthermore, it was felt that such a step would simply produce a new crop of irresponsible promoters who would extract rich toll from the pockets of the public without adding materially to the production of gold.

ALBERT BURCH,
President,
California Metal Producers Association.

San Francisco, August 3.

The Market-Value of Gold

The Editor:

Sir—In the letter headed 'The Relation of Gold to War Finance,' which appeared in your issue of August 3, Mr. B. L. Thane states: "The price of pure gold in our standard of money is fixed at $20.67 per ounce. This value was arbitrarily fixed by the Bank of England when England decided that it was advisable to fix the value of gold in order to stabilize exchange."

Although it is quite probable that the British government was influenced by the advice or suggestion of the Bank of England when it (the British government) enacted the law which requires that twenty pounds Troy weight of standard gold (eleven-twelfths fine) shall be coined into 934½ parts, or pieces, each of which is called a 'sovereign' or 'pound sterling,' that Act simply de-

termined that gold should be the standard of value and that the weight of the unit of value should be 123.2744+ grains of said standard (115,200 gr. ÷ 934½), but it in no wise determined the worth or purchasing power of that quantity of gold. The British government decided "arbitrarily" only that a certain weight of a particular commodity should constitute its unit of value. The worth or purchasing power of such unit cannot be decided "arbitrarily" because such worth is determined solely by the exigencies of trade and commerce.

An ounce Troy (480 gr.) of British standard gold divided by 123.2744+ gr. (the number of grains of standard gold in a sovereign) gives a quotient of 3.893+. Reducing the fraction to shillings and pence, we obtain £3 17s.10½d.; hence the 'price' of British standard gold is said to be three pounds seventeen shillings ten pence half-penny per ounce. There are 113.0016+ gr. of pure gold in a sovereign, and an ounce divided by this number of grains gives a quotient of £4 4s.11.45d., therefore the 'price,' in British money, of an ounce of fine gold is four pounds four shillings eleven and 45-hundredths pence or, as stated by Sir Lionel Phillips, "roughly 85s. per oz." ('The Importance of Gold Production,' M. & S. P., August 3, 1918.)

Similarly, our Government decided "arbitrarily" that 25.8 gr. of standard gold (nine-tenths fine) or 23.22 gr. of fine gold should be its unit of value; but that enactment neither "arbitrarily" nor otherwise determined the worth or purchasing power of that quantity of gold, because, as is the case with the sovereign, the exigencies of trade and commerce determine the worth or purchasing power of the amount of gold in a U. S. dollar.

By dividing an ounce (480 gr.) by 23.22 gr. the quotient is 20.67183+; therefore, in terms of the U. S. unit of value, the 'price' of gold is said to be 20.67183+ dollars per ounce, but, whether one says the 'price' of fine gold is "roughly 85 shillings per oz." or $20.67 per oz., its worth, exchange value or purchasing power is only what one can get for it when it is traded or bartered or swapped for something else.

As is stated in my letter entitled 'What is a Dollar?' (M. & S. P., Aug. 3, 1918), the word 'price' is used particularly to express the worth of anything in terms of a unit of value, but, because all values are relative, it is impracticable to express the value of anything in terms of itself. For example, it conveys no idea of value to say a ton of coal is worth twenty hundred-weight of coal. Similarly it should convey no idea of value to say an ounce of gold is worth 20.67+ times 23.22 gr. of gold; but that is literally what is meant when one says the 'price' of gold is $20.67+ per ounce or "roughly 85 shillings per ounce." To appreciate this fact fully one must disposses one's mind for the moment of one's idea of the exchange value of 'dollars' and 'shillings.'

Again, Mr. Thane states that "in the $20 gold-piece as now issued there is not quite an ounce of pure gold, the difference between $20 and the $20.67 consisting of copper added for the purpose of making the coin harder and more serviceable." It seems difficult to understand precisely what is meant by this. But, as a matter of general information, it may be stated that the $20 gold-piece weighs 516 gr. (20 times 25.8 gr.) of which nine-tenths or 464.4 gr. (20 times 23.22 gr.) is pure gold and 51.6 gr. is copper. At its present price, 26c. or 6.0372 gr. of gold per lb., the copper in a $20 gold-piece is worth 51.6/7000 of 6.0372 gr. of gold or 0.0445+ gr. and, as one cent is 0.2322 gr. of gold, the copper in a $20 piece is worth now $0.00191+ (i. e., 0.0445+ ÷ 0.2322); "the 'difference' between $20 and the $20.67 consisting of copper" is $0.67. This sum would purchase almost 2.6 pounds of copper, that is, nearly 18,200 gr., and there are only 51.6 gr. of copper in the $20 gold-piece! What does Mr. Thane really mean?

Quoting once more, Mr. Thane refers to "the fact that the value of the gold produced, being fixed in price by the Government, therefore enjoys no increase in its market value."

In controversion of this statement that the market-value of gold does not increase (as well as diminish) it seems only necessary to cite the fluctuations in values as quoted, for example, in the various stock-exchanges, where the market-value of gold practically may be said to be constantly rising and falling. The ups and downs in quotations mean, respectively, decreases and increases in the market-value of gold as compared with the properties in question.

W. DE L. BENEDICT.

Monterey, August 6.

The Status of Gold

The Editor:

Sir—The letter of Mr. Bart Thane in your issue of August 3 is answered by another from Mr. W. de L. Benedict in the same issue. If another value of gold were seriously considered by statesmen, there certainly would be an immediate disappearance of the confidence now held by foreign countries in the good faith of the United States to uphold the value of the dollar. Even the mere suggestion of such a scheme in your periodical, circulating as it does in many foreign countries, might be harmful to the credit of the United States.

Is not the only aid to the situation Mr. Thane describes to be found in the cultivation of confidence in the value of silver by every national law international agreement possible?

BLAMEY STEVENS.

Los Angeles, August 5.

PLATINUM exported from Colombia in 1917 was valued at $2,160,000, compared with $1,350,000 in 1916, and $607,500 in 1915. At the average New York price—$103—of platinum in 1917, last year's output was 21,000 oz., against 16,000 oz. in 1916, and 12,000 oz. in 1915. 'El Nuevo Tiempo', a Bogota paper, states that the value of gold and platinum recovered in the El Choco region from 1654 to 1917 totals $211,732,110; and if the precious metals from the department of Antioquia were added, the total would be doubled.

Lieutenant Forbes Rickard, Jr.

The casualty list of August 4 stated that Lieutenant Forbes Rickard, Jr., had been killed in action. Recent letters from him mentioned the fact that he was billeted with Scottish and Australian troops, and it is believed that he was with the force that captured the village of Meteren, in the Bailleul sector, upon the second day of the Allied offensive. The official dispatch said that he was killed on July 19. The eldest son of Forbes Rickard, of Denver, Colorado, he was a young man of unusual promise. He graduated with honors from

LIEUTENANT FORBES RICKARD, JR.

Bowdoin college in the class of 1917 and won a post-graduate scholarship at Harvard, but this he relinquished in order to go immediately to the officers training-school at Plattsburg, where he did so well that he was offered the choice between a first lieutenancy in the National Army and a second lieutenancy in the Regular Army. He chose the latter and was assigned to Camp Greene, where, after a short interval of further training, he was promoted to first lieutenant. He sailed for France in April and had been in active service for less than a month when the end came. He was 22 years of age, 6 ft. 2 in. tall, broad-shouldered, a splendid specimen of young American manhood, as fine in body as in mind, and to these natural gifts he added a courtesy and considerateness that endeared him to all that knew him. As valedictorian at Bowdoin in June 1917 he delivered a poem that speaks for itself. No finer expression of the young American ideal in these great days has been uttered. Note the last line. As he wrote it, so he lived it. We bow our heads in sorrow; we lift them with pride.—T. A. R.

We who are met in these last precious days
That crown the largess of our fateful years
Lift now our parting song. The darkened ways
Spread wide before us, and our youthful tune,
Sad in the loss that lies too deep for tears,
Faints on our lips, and finds its end too soon.
Commencements past have opened peaceful doors
To those young lives so eager to begin,
And showed the promise of far-ranging shores
Where life was sweet, and all the world to win;
We lift our eyes to sacrificial wars
Where death is peace and weary ranks are thin.
Our road leads on to fields in flaming France,
Across the seas our strength shall make secure;
And as bright youth leads on the grim advance
Our bannered hosts shall make old freedom sure,
Not by our strength alone, but by the might
Of honor warring with a crumbling wrong,
By Belgium's brave defiance in the night
Of her most certain doom, and in the long
Brave suffering that made her name a light
For us to follow, by her soul made strong.
And by the noble martyrdom of France
Who cried "They shall not pass," and did not yield,
But checked the fury of the foe's advance,
Giving her bleeding body for a shield;
By England's glory and the distant call
That raised a host where'er allegiance led,
Though half the world away, and brought them all
To fix the crown of Empire on her head.
And by the strength of those all-honored dead
Who cannot see fulfilment of the end
They died to win—but in their bodies' stead
Give us their spirit's strength, and hail us friend.
Their work is done, and though they could not stay
They built the glory of a later day.

Deep-brooding pines, beneath whose aging peace
The sunlit faces flash, and turning go—
Remember us, who take a swift release
And in far lands defend the best we know.
Deserted halls, that echoed to the sound
Of these our voices seeking after truth—
Forget the carelessness you often found;
Remember still the strivings of our youth
That mixes dreams with laughter, songs with tears,
Pure gold with dross, and never will confess
The deepest of its loyalties and fears
Till suddenly it renders all—no less.

FORBES RICKARD, JR.

June 21, 1917.

Physiological Effects of Gases on Man

A compilation of the properties of gases found in mines has been made by G. A. Burrell, and issued as a chart by the U. S. Bureau of Mines. It is useful to those operating in metal mines as well as in coal mines. An abstract of the statement is given below.

Oxygen. In some persons breathing is affected when the proportion of oxygen in the air drops to 13%. With 10% the breathing is distinctly deeper and the lips become slightly bluish; with 7% life is endangered and unconsciousness soon follows. These statements refer to persons at or near sea level when they suddenly enter low-oxygen atmospheres. By acclimatization man becomes accustomed to low-oxygen atmospheres; for instance, men live at altitudes of 12,000 ft. or higher, where the percentage of oxygen by volume is equivalent to air at sea level that contains 13% or less of oxygen. In coal mines a low-oxygen atmosphere means that the ventilation is poor. Coal reacts with the oxygen of the air in mines, and sometimes absorbs and holds it to such an extent that the residual atmosphere does not contain enough oxygen to support life.

Carbon Monoxide. This is a colorless, odorless, and tasteless gas, which is very poisonous; 0.05% carbon monoxide is sufficient to produce in time slight symptoms of poisoning; 0.12% may produce slight palpitation of the heart in 30 minutes, a tendency to stagger in 1½ hours, and impairment of sight and hearing and confusion of mind, headache, and sickness, in 2 hours; 0.2% is very dangerous to man. Exposure for 20 minutes to air containing 0.25% may bring on nausea and headache lasting 12 hours. Canaries collapse in atmospheres containing 0.15% of monoxide in 18 minutes, and show distress in 3 minutes; hence they can be used to warn men of the presence of carbon monoxide. The gas may be present in deadly proportions in an atmosphere in which a miner's lamp will burn, so that the lamp gives no warning of its presence.

Hydrogen Sulphide, Nitrogen Oxide, and Sulphur Di-oxide. These three gases are all harmful to man even in quite small proportions. As little as 0.05% produces almost immediate distress in canaries and mice.

Methane. Methane has no physiological effect when breathed, but may render air unfit to breathe by diluting it until the proportion of oxygen is too low. This gas is very explosive when mixed with air, and because of the quantities in which it is formed is the most dangerous gas generated in mines.

Carbon Di-oxide. Carbon di-oxide does not usually cause distress in man until 3 to 4% is present in the air. Men may work for a considerable time in such an atmosphere, but are more quickly fatigued; 7 to 8% causes more urgent symptoms; 10% causes marked distress, severe headache, heavy panting, throbbing of the heart, flushing of the face, and stupefaction. Carbon di-oxide stimulates the so-called 'respiratory centre' in the brain, and makes a person breathe more air in a given time. As little as 1.4% may cause an increase of 50% in the volume of air that is breathed. This deeper breathing consumes energy, just as work does, and limits the amount of work a man can do, in proportion to the quantity of carbon di-oxide breathed. Breathing a large amount of carbon di-oxide produces a poisonous action because the carbon di-oxide in the air breathed prevents the blood from giving off the carbon di-oxide in the lungs.

Nitrogen. Nitrogen is physiologically inert, and is harmless to man. It has no effect other than to act as a diluent of the oxygen in the air.

Effect of Warm, Moist, and Still Air. A hot moist atmosphere prevents the evaporation of the perspiration. If the hot moist air is stationary, it becomes entangled between the clothing and the skin and becomes warmed to the body temperature. Hence the body cannot lose heat to the air and the skin becomes warm, flushed, and bathed in perspiration. Setting the air in motion by a fan whirls the hot air away from the body and allows cooler air to take its place; hence the beneficial effects of a fan in a room, even if fresh outside air cannot enter. If the wet-bulb temperature of the air is the same as that of the body, 99° F., the body cannot lose heat, but if the air-temperature is about 70° F., perspiration can evaporate. Above 75° F. wet-bulb temperature, the amount of work a man can do begins to decrease. Between 80 and 85° F., wet-bulb temperature, hard continuous work is almost impossible. Wet-bulb temperatures are determined with a sling psychrometer.

The Germans, hard pushed for supplies of copper and lead, are reported to have found an efficient substitute for pipe made of these metals. Successful experiments are said to have been made with pipe manufactured chiefly of paper, and possessing three to four times as much resistance against interior pressure as leaded pipes, while they weigh only about one-ninth as much. Their strength, as compared with copper pipe, is as 1 to 6, and their weight as 1 to 7, but it is added that if paper pipes were made equal in weight to copper pipes they would be equal to them in strength also. If the paper pipes are well glued they should have sufficient power of resistance to be used as gas-pipes.

War-bread causes no serious digestive difficulties when combined with a mixed diet such as can be had in cities, but in remote districts, where the fare is more limited, it is important to know that researches made in France show the need of avoiding salt altogether in preparing bread made of substitutes for wheat. Instead of salt weak lime-water should be used in mixing the dough. Daily ingestion of too much salt causes failure to assimilate protein and other nitrogenous substances, resulting in loss of energy, and an abnormal increase in the appetite. Excessive use of salt leads to acidity of the stomach, also, and this effect is more pronounced when war-breads made with salt are eaten.

ANCIENT WORKINGS UNCOVERED IN PREPARING STEAM-SHOVEL BENCH AT CHUQUICAMATA

Tunnel-Blasting at Chuquicamata

By E. E. BARKER

In blasting for steam-shovel work at Chuquicamata, where the height of the bench now being operated is about 180 ft., there were many problems to be solved before satisfactory work was accomplished. In consequence of the high cost of drilling with churn-drills, namely, $3.60 per foot, some other means of blasting had to be found. The excessive cost was due to the hardness of the rock, and to the many seams and fractures throughout the deposit, causing excessive breakage of tools. Also the high cost of coal ($23 per ton) was an important consideration. The comparison of drilling records on this material with those from drilling in such porphyries as the Nevada Consolidated orebody shows an average footage per 9-hr. shift at Chuquicamata of eight to twelve feet as against an average in Nevada of 60 ft. This large difference, together with the increased cost of supplies in South America, readily shows that churn-drill costs in the soft-porphyry mines cannot be equalled in the harder granite at Chuquicamata. This work at the Nevada Consolidated in normal times cost a maximum of 50c. per foot.

The higher the banks became, starting from the contour and finally reaching 180 ft., the more footage was necessary, so that, say in a 150-ft. bank, one had to balance a drill-hole of 150 ft., together with the expense of springing a pocket for the blasting charge, against the cost of running a mine-drift 25 ft., which was the spacing between the drill-holes. Blasting by churn-drills, even to a height of 60 ft., in this material, cost as high as 25c. per ton, so that it became evident early in the blasting operations that some other method must be devised. The result was that the blasting methods were changed from churn-drill holes to underground tunnels. It is surprising to find how little is written on the subject; accordingly the work in blasting by tunnels was experimental from the start.

Questions such as the following had to be solved:

1. How deep below the steam-shovel grade should blasting drifts be driven?

2. How deep into the bank, or at what horizontal distance, should the blasting-drifts be spaced?

3. Would it be possible to blast with the black powder in the containers piled as it were in a magazine, or would it be necessary to open the containers and deposit the powder loose in the blasting-chamber?

4. Would the danger of the operation of loading exclude the use of the method, and what plans for safety might be necessary to diminish this danger?

5. In blasting by electric current, what system of wiring should be used, whether series, multiple-arc, multiple-series, or series-multiple, and what voltage of current should be used?

6. Would it be necessary to concrete the cross-cut between blasting-drifts, or would run-of-mine tamping be sufficient?

7. Could mining operations (driving) be carried on at the same time that loading was in operation in the drift to be blasted?

8. What saving in cost could be effected by the tunnel-method of blasting over that of the churn-drill?

9. What kind of explosive should be used as a detonator, and what ratio should the detonation-charge bear

to the blasting-charge, and how should it be placed?

10. In calculating the powder requirements for a given tonnage, should the powder charges be calculated on the cubic metres to be broken, or in direct proportion to the line of shear (least resistance)?

11. At what intervals should the blasting-charges be spaced along the drift to be loaded?

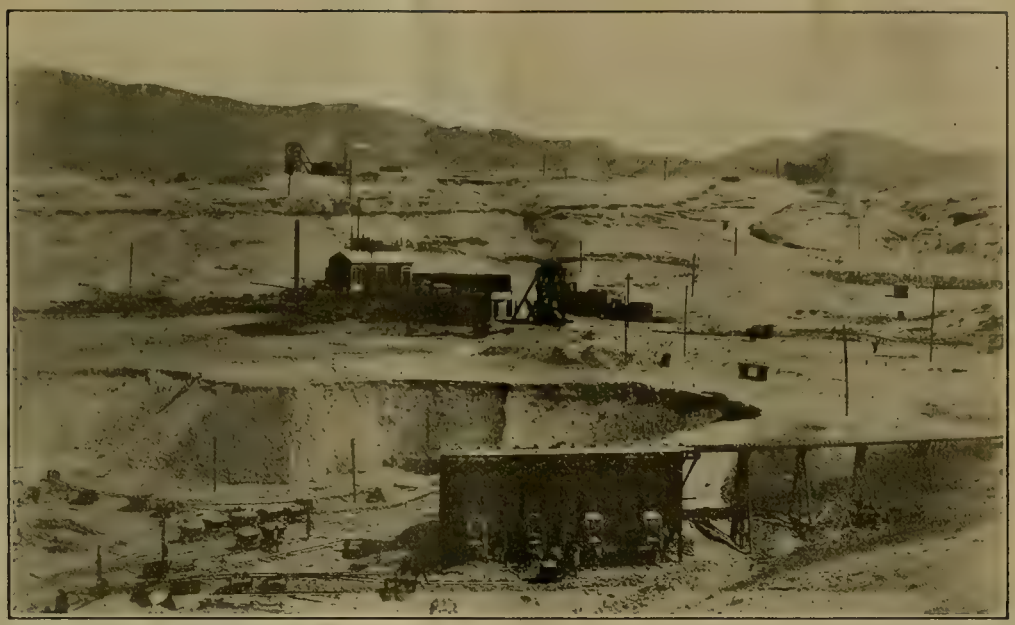
The above questions give an idea of the many problems that confronted us in laying out this work. To start with, the floor of the blasting-tunnels was placed three metres below the floor of the steam-shovel grade, and the horizontal depth into the bank was made 15 m. In deciding on the depth below grade, one had to be certain that the blasting-charges were low enough so as to leave no hard bottom for the steam-shovels. In the many blasts that followed, 3 m. was found to be satisfactory, and where the height of the bank was 45 m., the horizontal distance was increased to 30 m. It was found that the horizontal distance could be two-thirds of the height of the bank to be blasted, so that the spacing of the drifts became 15 m., 22½ m., or 30 m., depending upon the height of the bank. By exhaustive experiments it was ascertained that the best form of wiring was in multiple-series, that is to say, five strings of caps each, and these connected in multiple to the main blasting leads. In each case all charges were double-primed, each cap of the blasting-charge being connected to an independent series of wiring back to an independent transformer, both controlled by the one switch on the higher voltage-line, which in this case carried a current of 500 volts, so that in case of failure of any part of one series of connections, the blaster was protected by having the second series to depend upon. From the figures that follow, when it is realized that a blast of this kind may cost upward of $50,000 for its preparation before the blasting-switch is thrown, it is seen that great care must be exercised to insure success.

The detonation of these charges, the best spacing of which was found to be 10 m. centre to centre, was accomplished by the use of 60% nitro-glycerine dynamite; the proportions of dynamite used being 2% of the weight of the blasting-charge. The detonators consisted of two or three boxes of dynamite per charge, the top of one of which had been previously removed, a hole bored in each side of the case, and two sticks primed with a No. 6 electric exploder. The fuse-wires were placed through the hole of the box on each side, each cap being connected to its separate system of wiring. This case of dynamite, with others alongside, if necessary, was placed in the heart of the black-powder charge, which was loaded in the containers, cans, or sacks, as the case might be, without any attempt being made to open them. Each set of leading-wires was placed in grooved 2 by 3-in. lumber, and battened down with half-inch battens over the top of the groove. These conduits were placed one on either side at the bottom of the drift, the fuse-wires of each detonator being connected in series to its system of wiring.

The first blast fired was bulk-headed in the connecting cross-cut to the next in the rear by a 10-ft. block of concrete. After the shot, the concrete was so undisturbed that this procedure was found unnecessary, and the cross-cuts were subsequently filled with run-of-mine rock only. Since the gases formed by an explosion of black powder are said to be about 300 times the original volume at 60°F., and since the increase in volume for each 5° rise in temperature is 1%, it is estimated, from the fact that fused feldspars were found in the vicinity of the blast, that the temperature of the explosion is at least close to 2000°F. This would give a volume of gas 1164 times the volume occupied by the original charge, so that the refinements in loading with a charge of this size, in taking pains to fill all interstices and voids, is altogether unnecessary. The loss in explosive force would be at the most but a small fraction of one per cent. Since the gas is formed almost instantly, there is no time for this volume to get through the cross-cut tamped with mine-rock, and the breaking of the bank follows.

Although there is danger attached to all forms of blasting, when powder is handled without opening the containers, when electric safety-lamps are used, and strict regulations are enforced as to smoking and carrying matches, the danger of the operation is greatly minimized. Doors were placed in the cross-cuts at the entrance to the drifts to be loaded, with only the blaster and his crews having access to this compartment. The loading of the drifts was done at night, as there were fewer men on that shift working in the mine, and also fewer on the steam-shovel bench. As far as possible, it was aimed not to have steam-shovels working in front of the sections which were being loaded. It was found that mining operations could be carried on in the drifts next to those being loaded, so that this work need not be retarded during the time of loading. Blasting by tunnels is, of course, not new, but the usual way was by an adit with drifts. This was impracticable with steam-shovel work, because each time a shovel would pass the entrance to the tunnels would be lost, so that it became necessary to sink shafts some distance back from the working-face, and to drive the blasting-drifts from a cross-cut extended from the bottom of these shafts.

The largest blast at Chuquicamata was fired in three sections, the plans of which are given in Fig. 1, 2, and 3 respectively. That shown in Fig. 1, representing section 1, was blasted November 19, 1916; section 2, Fig. 2, November 21; section 3, Fig. 3, on November 26, 1916. These sections could have been fired simultaneously, except for the steam-shovel equipment, which had to be changed from one section to the other, so that ore-loading operations could be carried on without interruption, as the firing of the three sections would have tied up the greater part of the face. Section No. 1 consisted of 29 drill-holes in shallow ground, and 267.3 ft. of drift, as seen in the illustrations. Section No. 2 consisted of 29 churn-drill holes and 724 ft. of drift; in this case two parallel drifts being fired simultaneously. Section No. 3 consisted of 1318.6 ft. of drifts, showing a section in which 30 m. in horizontal distance was blasted for the



RECLAIMING OLD DUMPS REPRESENTING ORE REJECTED BY EARLIER OPERATORS

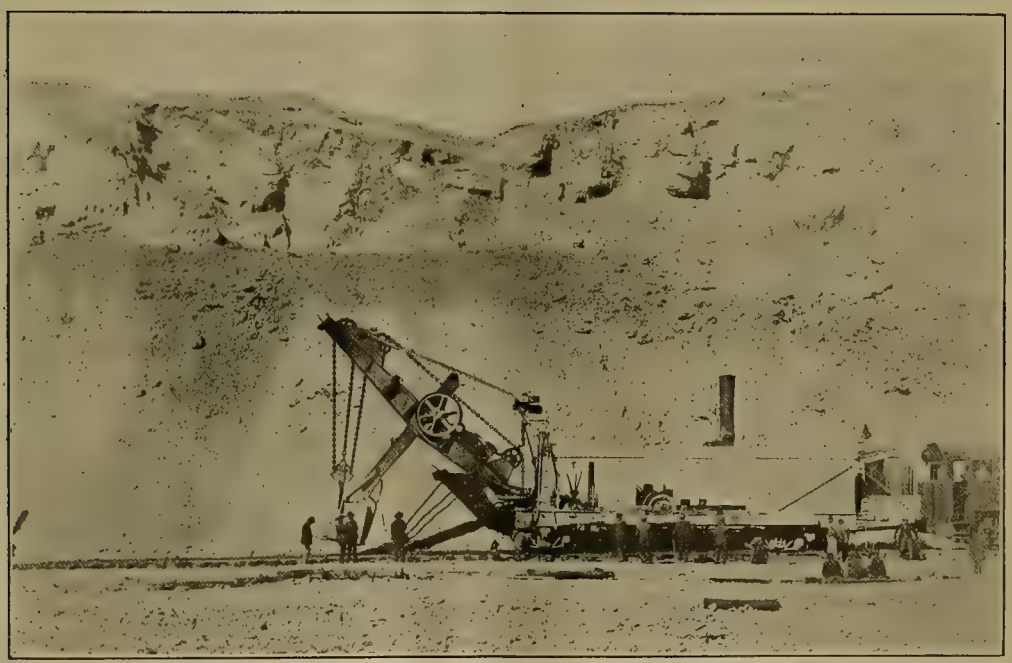


FIG. 10. SHOWING FINENESS OF ORE BROKEN IN BLASTING A BANK 160 FT. HIGH

first time. Details of the quantities used appear on each plan, but the grand total of explosives consisted of 813,000 lb. of black powder, and 85,850 lb. of dynamite, or 450 tons, which broke 1,229,716 tons of ore at a cost of 10.59c. per ton. The cost of the blast by sections follows:

Section I—Tunnels and Blast-Holes Separated

Tunnel 'K', 3659—Blasted 11/19/16—7 charges

Ground broken, 49,840 m. = 65,188 cu. yd. = 140,644 short tons.

Drifts and cross-cuts, 81.5 m. = 267.3 ft. at $13	$3,474.90
Filling, 50.9 m. at ₱13 Chilean pesos = ₱661.70 at $4.50	147.00
Explosives:	
Black powder, 125,000 lb. at $0.0608	7,600.00
60% dynamite, 2500 lb. at $0.302	7.55
Lead-wire, 1100 ft. at $4.25 per 500 ft	9.35
Exploders, 14 at $4.54 per 100	0.64
Casing for wiring 600 linear ft., 500 board ft. at $72 and labor, etc.	40.00
Transportation (burros), 8 days at $10.53	84.24
Labor:	
Loading gang, 5 days at ₱104 Chilean pesos = ₱520, at $4.50	115.50
Hoist-man gang, 2 days at ₱9 Chilean pesos = ₱18, at $4.50	4.00
	$12,230.63

8.7c. per ton.

Churn-Drill Holes, South End—11/19/16

Ground broken, 41,680 m. = 54,514 cu. yd. = 117,620 short tons.

Holes shot, 29	1,944 ft.	
Holes lost, 11	735 ft.	
	2,679 ft. at $3.60	$9,644.40
Springing (4 springs):		
60% dynamite, 9750 lb. at $0.302		2,944.50
Spool conducting-wire, 21,500 ft. at $0.0021		45.15
Exploders, 160 at $4.54 per 100		7.26
Labor (1st and 2nd springs, 20 in ½ day, 3rd and 4th springs, 20 in 1 day), 6 days at ₱104 Chilean pesos		139.00
Blasting charges:		
60% dynamite, 46,975 lb. at $0.302		14,186.45
Leading-wire, No. 14, 7800 ft. at $4.25 per 500 ft		66.30
Exploders, 58 at $4.54 per 100		2.63
Labor, 5 holes per day, 6 days, at ₱104 Chilean pesos		139.00
Transportation (burros), 4 days, at $10.53		42.12
		$27,216.81

23.1c. per short ton.

Section II—Tunnels and Blast-Holes Separated

Tunnels A 3569-3584—Blasted 11/21/16—21 charges

Ground broken, 72,190 m. = 94,420 cu. yd. = 203,714 short tons.

Drifts and cross-cuts, 220.7 m. = 724 ft. at $13	$9,412.00
Filling, 178.2 m., at ₱13 Chilean pesos = ₱2316.60, at $4.50	515.00
Explosives:	
Black powder, 165,900 lb. at $0.0608	10,086.70
60% dynamite, 3200 lb. at $0.302	966.40
Leading-wire, 3000 ft. at $4.25 per 500 ft	25.50
Exploders, 42 at $4.54 per 100	1.91
Casing for wiring, 1460 linear ft., 1220 bd. ft. at $72 and labor, etc.	90.00
Transportation, 10 days at $10.53	105.30
Labor:	
Loading gang, 15 days at ₱104 Chilean pesos = ₱1560 at $4.50	347.00
Hoist-man, 3 days at ₱9 Chilean pesos = ₱27 at $4.50	6.00
	$21,555.81

10.6c. per ton.

Churn-Drill Holes, North End—11/21/16

Ground broken, 26,800 m. = 35,184 cu. yd. = 75,912 short tons.

Holes shot, 29	1,263 ft.	
Holes lost, 7	363 ft.	
	1,626 ft. at $3.60	$5,853.60
Springing (4 springs):

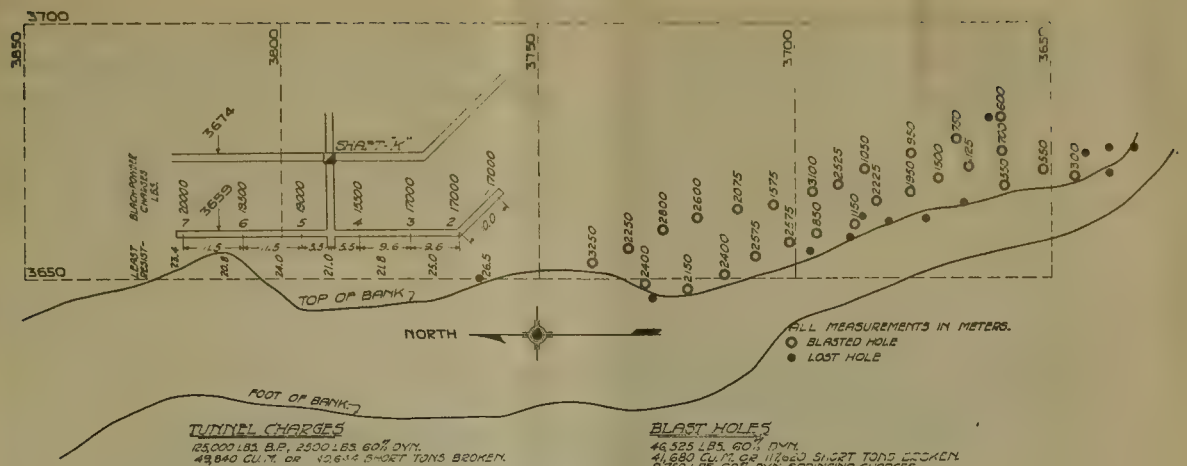
Unit Costs

Costs	Chilean pesos	U. S. currency
Driving, per ft		$13.00
Tamping, per metre	₱13	
Black powder, per lb		0.0608
Dynamite, 60%, per lb		0.302
Dynamite, 62%, per lb. (purchased locally)		0.6007
Dynamite, 75%, per lb		0.30
Leading-wire, per 500 ft		4.25
Conducting-wire, 450 ft., 2-lb. spool		0.946
Exploders, per 100		4.54
Casing for wiring, per 1000 bd. ft		72.00
Labor:		
Loading-gang (9 men), per day	104	
Hoist-man, per day	9	
Transportation:		
10 cargo burros, per day		4.00
3 burros for men, per day		1.20
1 capataz	10	
2 burreros	14	
9 trips of 2000 lb. per day. Total for transportation, per day		10.53
Blast-hole drilling, per ft		3.60

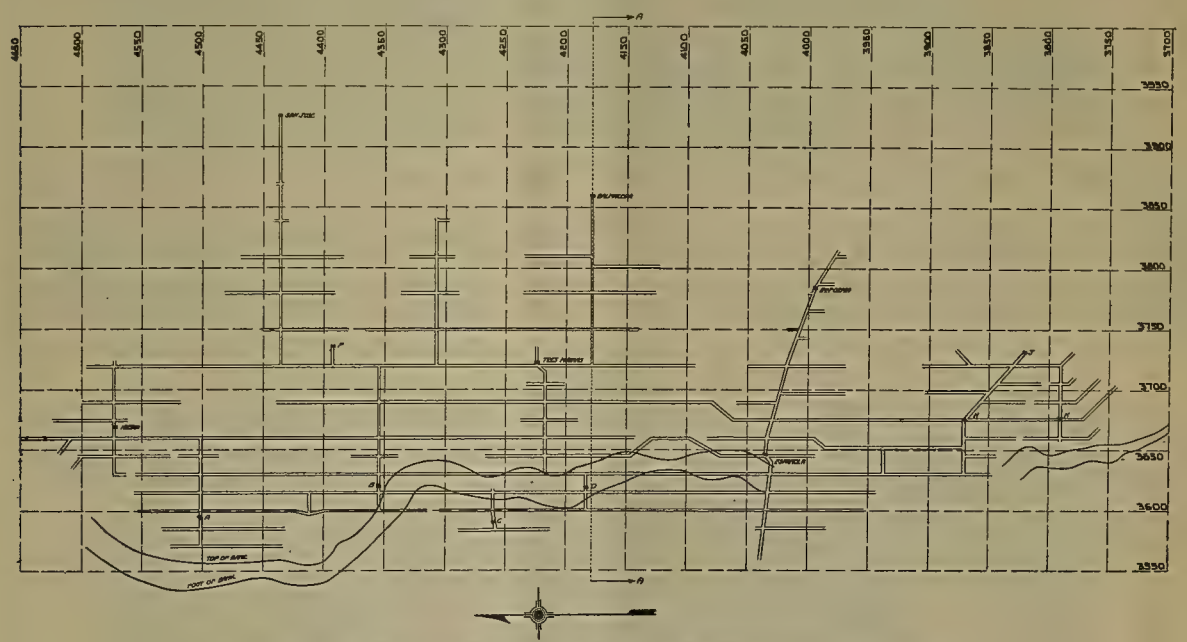
Casing for wiring, 2 lines for total length of drifts and cross-cuts.
Leading-wire, 4 lines for total length of drifts and cross-cuts.
Exploders, 2 for each tunnel-charge.
Exploders, 2 for each blast-hole.
Springing (4 times)—1st and 2nd, 20 springs in ½ day; 3rd and 4th, 20 springs in 1 day.
Loading blast-holes, 5 holes per day with dynamite.

The marked difference in the cost by tunnels, 8.53c., and the cost by churn-drill holes, 21.6c., was forcibly shown by the results of these blasts and proved conclusively that the tunnel-method was doing the work for less than half the cost of the same work by drill-holes. The above costs do not include the expense of block-holing the boulders, following the large blasts; this is taken up later. Neither is allowance made for the proportion of overhead expense.

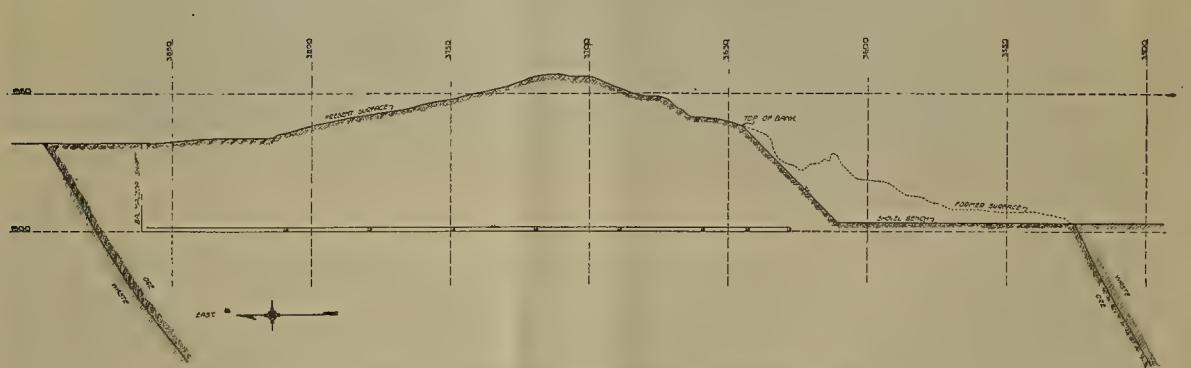
Much controversy has arisen over the so-called method of high banks versus the method of low banks as applied to the work at Chuquicamata, the arguments being that the smaller the height of the bank, the smaller will the rock be broken, the safer the operation, and the more efficient the shovel-performance. On the other hand, with



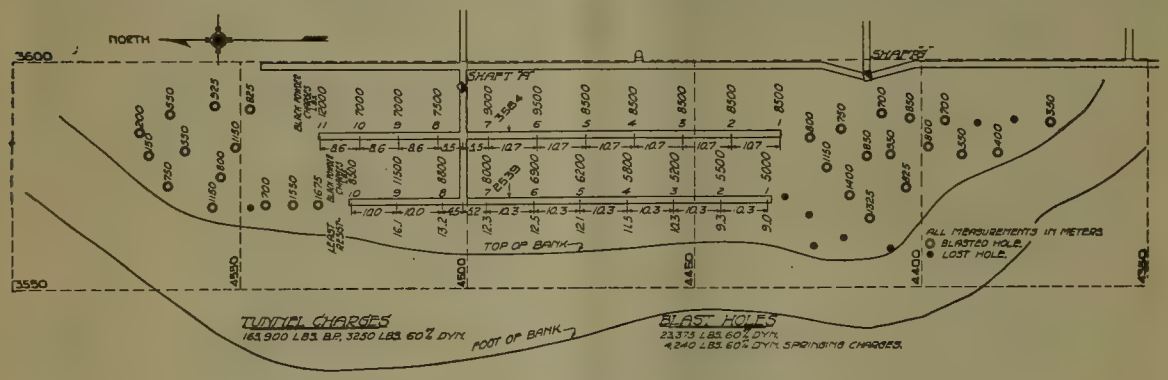
SECTION 1, NO. 10 SHOT FIRED NOVEMBER 19, 1916; ORE BROKEN 258,264 TONS



PLAN OF BLASTING-DRIFTS, CROSS-CUTS, AND SHAFTS; SCALE 1 TO 1600



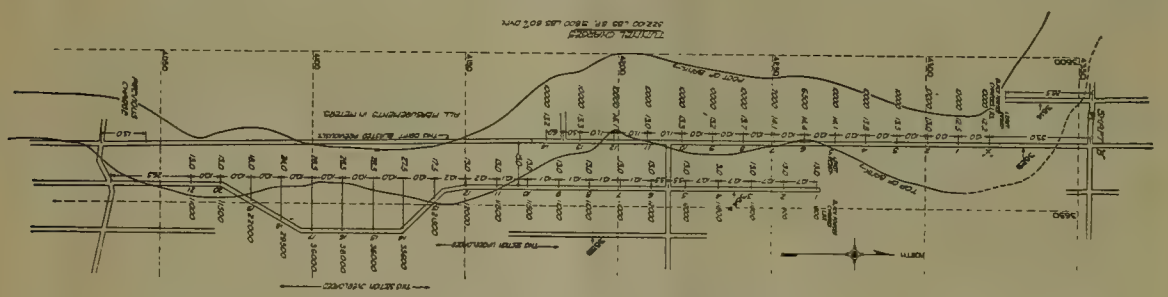
drill-holes, one is apt to have trouble with pockets, leaving hard rock in the bottom for the shovel to handle; missed holes are more likely to occur; and any delay to the churn-drill operation, resulting from lost holes, broken tools, and so on, would mean stoppage in steam-shovel loading, all of which would be reflected in the costs against the low-bank method. The question resolves itself into that of the cost per ton placed in the bins, and



SECTION 2, NO. 11 SHOT FIRED NOVEMBER 21, 1916; ORE BROKEN 279,626 TONS

I do not believe that any increase in shovel-efficiency in the low banks, owing to a lower amount of large rock, will offset the large difference in cost by breaking the ground by the tunnel-method over that of the blast-hole method. While it is admitted that there will not be the same proportion of large rock in the low banks as in a higher bank, it must not be forgotten that in certain

$1944 for the $9644, and the total cost of the drill-hole factor in this shot would be $19,516.81, or 16.6c. per ton, so that even with the high cost of drilling eliminated, the cost per ton broken would still be approximately twice that for breaking the ground in the same vicinity by tunnels. The articles in recent issues of the MINING AND SCIENTIFIC PRESS by Courtenay De Kalb, describing the operations at Ajo, Arizona, are most interesting, and from all I know of the operations there the situation is about the same as we found it in Chuquicamata. Curiously enough, in blasting operations at both places, large rock developed, even in so low a bank as 30 ft., so that primary jaw-crushers of large dimensions were found necessary. In any event large rock will have to be handled at either mine, and I would not be surprised,



SECTION 3, NO. 12 SHOT FIRED NOVEMBER 26, 1916; ORE BROKEN 691,826 TONS

sections, both at Chuquicamata and at Ajo, rock too large to be handled resulted from blast-hole drilling where the banks did not exceed 50 ft., so that low banks do not entirely eliminate this objection.

Churn-drills were used exclusively at Chuquicamata until the heights of the banks reached about 60 ft., and coarse rock was produced continuously, which, together with the resulting hard bottoms, missed holes, and excessively high cost, resulted in this method being superceded by tunnel-blasting, the difference in cost being demonstrated above. In the case of the blast-holes fired in section 1, should there have been no lost holes, and should the net footage, namely, 1944 ft., have cost but $1 per foot instead of $3.60, we would have substituted considering the bank-height of 125 ft., although I do not know the footage per shift that can be made in the Ajo deposit, if a blasting scheme in that property by tunnels would not be found cheaper in the end, although the cost of supplies and fuel is much less than at Chuquicamata.

A premature explosion, where the tunnel-method of blasting was used, might, of course, cause great loss of property and life, depending on the time when the accident occurred, but on summing up the premature explosions from drill-holes, or from other causes in any large blasting operation, the danger would appear to be no greater than in any other form of blasting on a large scale. During the three years of blasting in this way at

Chuquicamata, there never has been a miss-fire, although in the churn-drill blasting there have been several. Missed holes from churn-drill practice are largely accountable to the tamping scouring the leading or connecting wires, so that short circuits develop and the cap in one hole does not explode, while all the rest are detonated successfully. In blasting a string of holes one missed hole is usually hard to locate, and it is not until the shovel is digging in this section that the unexploded charge is found, and in nine cases out of ten, the teeth of the dipper will be into the charge before the powder is discovered, so that the chance for accidents from this source is great. In blasting by the tunnel-method, the blaster's wiring connections, caps, and the like, are all within his reach, and can be inspected carefully, whereas in the drill-hole no one knows what has taken place; it must be taken for granted that the connections in the bottom of the hole are all right. A galvanometer test will show the hole to be safe, when really the wires are perhaps 'shorted' across the cap.

FIG. 12. OLD MINES OF THE DISTRICT, AND HEAD-FRAMES NOW USED TO ENTER BLASTING TUNNELS

With regard to the height of bank best suited to the purpose of selecting ore, I would be inclined to say that the lowest bank consistent with good steam-shovel practice would be the most desirable. It has been found, however, in high banks, that where zones of waste appear, they tend to slide into the shovel-pit, so that fair

FIG. 13. BANK BLASTED, READY FOR STEAM-SHOVEL

sorting can be accomplished, that is, if the bottom of the bank is ore and the top is waste, the shovel will load ore at the bottom until the top caves, after which waste will be loaded, so that there is little to be said in favor of any given bank-height for this purpose. The irregularity of ore and waste is such that no matter how shallow the bank may be, there would be times when ore and waste would be mixed.

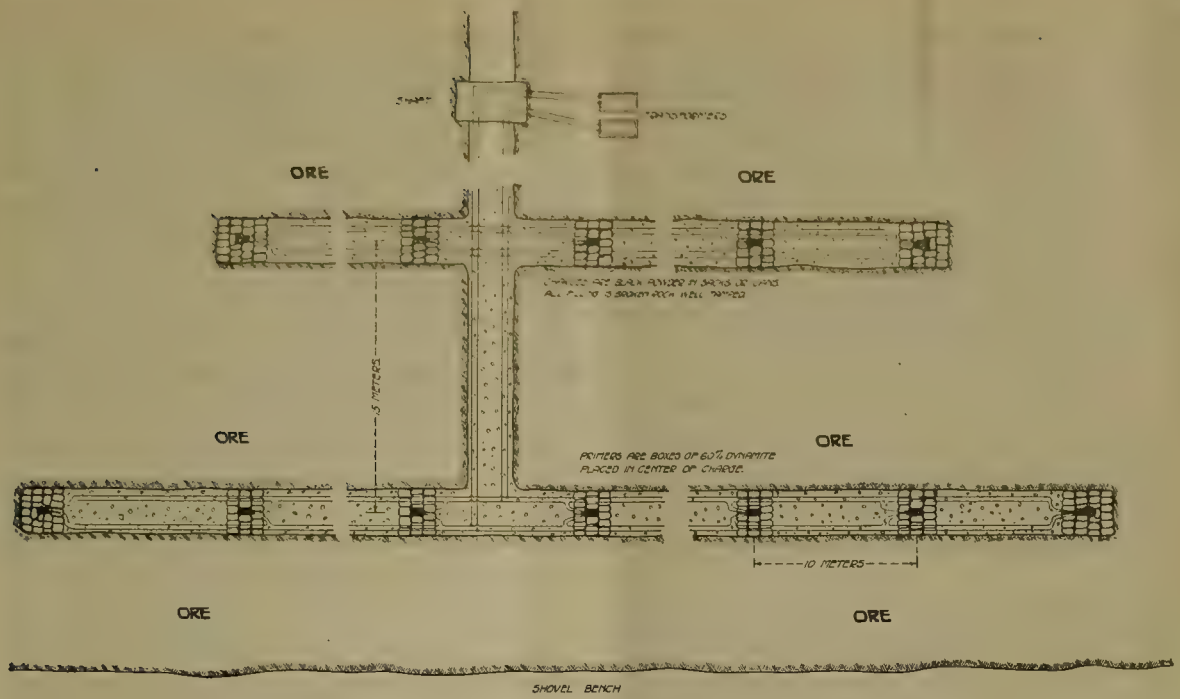
With regard to the large rock found in blasting hard-rock sections, the experience at Chuquicamata was that no matter how these hard sections were shot, the big rock could not be broken in the blasting. Tunnels have been overloaded as much as 100%, and underloaded so as merely to shake the bank, and the results, so far as big rock were concerned, were practically the same. This is true also in the good blasting ground, as the steam-shovel operator understands it, that is, ground that will break fine with low banks in churn-drill blasting also will break fine on a 150-ft. bank with tunnel-blasting. The illustration, Fig. 10, shows how fine the ore was broken in blasting a bank 160 ft. high. In the same photograph, it will be noticed that the blasted ground occupies about one-half the height of the original rock in place, and with the broken bank as shown, there is obtained the most ideal loading conditions as regards fineness of material and height above the loading-track, namely, between 40 and 50 ft. This height in no way endangers either the machine or the crew, and it ensures the greatest number of cars for each move forward consistent with good loading. In the last shovel-cut, where the machine is close to the bank, care must be used to have rocks endangering the machine barred down. For this reason it was decided not to clean up the blasts entirely, which meant the re-shooting of a small amount of ground already blasted. In the end this was more desirable than to clean up the face, thereby endangering the operating equipment.

There were times when hard blocky sections were undershot. This is a costly mistake, as a hard section of bank, which is only shaken, has to be fought with block-holing and jack-hammer work; this is tedious and costly. For that reason it invariably pays to be sure that enough powder is used to break the ground, and, for a safety factor, to overload from 20 to 30% in addition. On the other hand, too much of an overload scatters the bank, so that track shifting becomes excessive, and the resulting low banks of broken material call for much moving, and give a low steam-shovel efficiency. Successful blasting under any given set of conditions, requires experience, for example, a given quantity of powder that will break a certain tonnage in one case may over or undershoot the same quantity in other conditions. The softer the rock usually the greater the blasting-charge necessary, as soft material tends to spring, while the harder rock will break with the same charge.

Much has also been written of the merits of different blasting-powders, many claiming that dynamite will fracture the rock finer. In blasting on a large scale this is not so. Were enough dynamite used to shatter the rock, the bank would be blown all over the steam-shovel bench. Dynamite, of course, does shatter more than black powder, on account of its rapidity, but only close to the blasting-charge. In calculating the charge to properly break a bank, practically the same conditions result, whether dynamite or black powder is used. Black powder for Chuquicamata was made at Calama, a town 15 miles distant. The ingredients used were, roughly, 75% sodium nitrate, 15% charcoal, and 10% sulphur. Extreme care was not used in this mixture, nor were the ingredients analyzed, but the powder was grained and glazed, and was most satisfactory. It cost, delivered at the mine, about 6c. per pound, and a given amount of 40% dynamite was equal in blasting-strength to about one and a half times the weight of the powder of local manufacture. Black powder was, all things considered, by far the most satisfactory, although many varieties and grades of explosives were tried. The commercial $NaNO_3$ used in this powder was as a rule rich in $KClO_3$. Higher-grade dynamites were used as a rule in drill-hole blasting, in order to get the most out of the pockets formed by springing, as previously stated. Recent photographs of the Cornelia Copper Co.'s work on shallow banks, showing the many big boulders, are typical of many sections at Chuquicamata on similar heights of bank. The cost of breaking these boulders at the latter place, previous to the time of the installation of the coarse jaw-crushers, was as much as 5c. per ton, and even higher in exceptional cases. After the erection of the coarse crushers, which could take practically anything that could pass through the steam-shovel dipper, the costs for block-holing dropped below 2c. per ton.

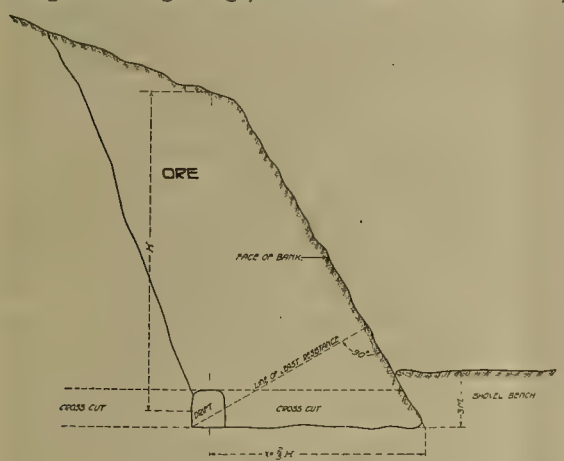
It will be seen, from a study of the blasting plans, that as wide a range as from 400 to 1200 lb. of black powder was used per linear metre of line of least resistance. It was early demonstrated that the height of the bank was of little importance in calculating a blasting-charge, that is, if the line of shear was 50 ft., the blasting-charge would be approximately the same, whether the bank was 100 ft. high, or of indefinite height. A drift through a section of 'hog-back', with the same line of shear throughout, and with heights of 40 ft. at each side of the ridge, and 130 ft. in the centre, was loaded on a basis of cubic yards to be broken, in order to prove this principle. The result was that the centre of the blast, or the point under the high part of the ridge, was greatly overloaded, while the section of low-bank heights was properly broken. The resulting pile of broken rock formed a semi-circle, with a point under the highest part of the ridge taken as a centre. It was clear from this point that it was necessary to calculate on the line of least resistance only, and this practice was thereafter followed.

Owing to the variable conditions in the rock to be broken, no empirical formula could be devised, and it was only from blasting in certain sections that knowledge was gained as to what factors per metre of least resistance should be used. The cost of driving the drifts, $4\frac{1}{2}$ by $6\frac{1}{2}$ ft. in section, at Chuquicamata, varied from $10



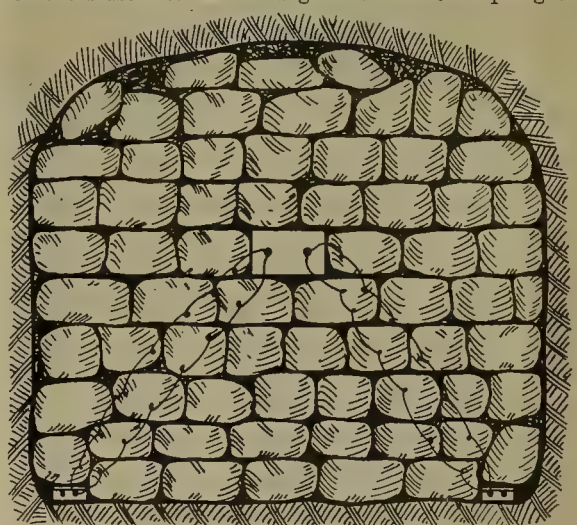
GENERAL ARRANGEMENT OF BLASTING CHARGES AND ELECTRIC CONNECTIONS

to $20 gold per foot, with an average of $13. The ground being hard and dry, no timbering was required. Muck was trammed from the faces in buckets on trucks, and during the operation of loading the space between the blasting-charges was filled with run-of-mine by this equipment. The greater spacing of the drifts required a larger blasting-charge, which filled from 70 to 90%



IDEALIZED SECTION

of the tunnel. No chambers were required to accommodate the blasting-charge, as the charges were loaded in the drifts themselves. The greater the space between the drifts, of course, the less cost per ton broken. In the beginning, it was useful to have the drifts spaced 15 m. only, so that, in case the blast were undershot, the drift immediately behind could be re-loaded, this time with an overload, and the material of both blasts knocked down successfully. This did not happen often, but it is well for the blaster to know his ground before adopting the maximum spacing. The factors per line of least resistance, on a 30-metre spacing, show an increase per metre over the factors for a 15-metre line of least resistance in the same ground. The loading of drill-holes on the basis of a given factor per foot in depth of hole, with the slope as a constant ratio, always gave good results, as the line of least resistance is proportionate to



LEADING WIRES IN COVERED GUIDES; 60% DYNAMITE PRIMERS IN CENTRE

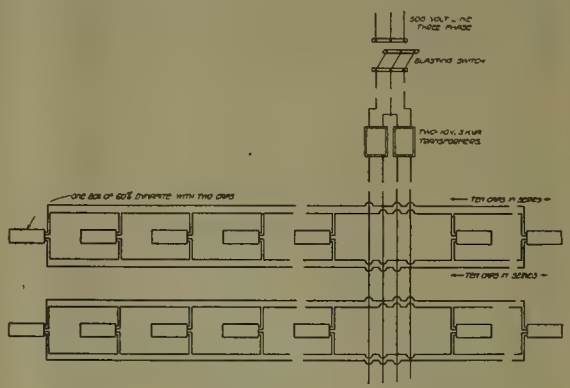
this height. Where the horizontal distance is uniformly two-thirds the vertical height, the factor per cubic metre works out well, and varies in this material from 1½ to 2½ lb. per cubic metre to be broken.

After a blast by the tunnel-method, and before the miners are allowed to return to work in the blasting-tunnels that are in preparation, the helmet-crew, consisting of three men, one or more supplied with a bird in a cage, descend into the mines, and test all the drifts for bad air. The helmet-crew usually does not enter until 24 hours after the blast, and it is seldom found that gases entering the mine interfere with the work for a longer period than 48 hours. It is always well to maintain a regular helmet-crew to do nothing but act as a life-saving squad. They should have regular exercises and duties to perform daily, in connection with their work, and be always available at a moment's notice, because, in the case of a premature explosion, the great danger to the men underground would be from asphyxiation.

A blast is described in a recent bulletin of a powder company, in which the adit of the 'gopher', amounting to 30 ft., and a part of the branch of the 'T', were completely filled with concrete. This we know now to be a useless expense, as the gases formed have no time to force their way through such a small opening. The principle is similar to the lesson that the small boy usually learns in trying to shoot the stuck wadding out of his gun with a fresh cartridge, or like the novice who tried to 'dynamite' the fish by sticking the muzzle of his shotgun under the water and pulling the trigger.

The springing of churn-drill holes is at best a most unsatisfactory procedure, as one is never certain that the pocket sprung is going to be large enough to accommodate the blasting-charge. If not large enough the powder will rise in the barrel of the hole. In the case of blasting at Chuquicamata, it was most essential to have a pocket of ample size, because, when the bottom could be successfully blasted, the top would take care of itself. In springing with 75% nitro-gelatin, which is the best explosive found for this work, from 12 to 15% of the weight of the full blasting-charge as a rule was used to spring the pocket. So much has been written about springing holes that I need make no comment here other than to say that the quantities used in springing holes usually increase in multiples of three, when the chamber is springing as it should. Where the collars of the drill-holes are likely to blow out, and where the ground is soft, and manifests a tendency to cave, it is often best, where the blaster has plenty of time, to use sand instead of water, and to fill the hole each time. This is costly, as the drill has to be placed over the hole each time to clean out the sand from both the hole and the pocket. Where the springing of drill-holes is in good ground, and where water can be used successfully for tamping, the usual rule is to use a gallon of water per pound of springing-charge, the quantities to be varied afterward according to the results obtained. By the use of a mirror to reflect the sunlight to the bottom of the hole, and by means of the tamping-dolly, which consists of a piece of round wood 36 to 40 in. long, tied preferably to a piece of window-cord, the blaster soon learns, within reasonable limits, whether or not he will be able to 'chamber' the charge in the pocket. When a hole gives trouble—and there are few that do not—the blaster tries to make up the difference in the blasting-powder necessary in the two adjacent holes. This invariably leaves a hard bottom for the shovel to work against, thereby seriously interfering with efficiency in loading.

A pocket that proves to be too small is disconcerting, as, for example, when the blaster had calculated that 5000 lb. of charge was required and then finds that the pocket is full after 1000 lb. has been placed in the hole. The illustrations show the starting of work in opening the steam-shovel bench at Chuquicamata. The entire



SCHEME FOR WIRING

outcrop of the deposit, which is about three kilometres long by half a kilometre wide, is honeycombed with old workings and small dumps, some dating no doubt from pre-Incarial times. These in some respects were an advantage, as the excavation for railroad construction through these dumps was cheap, but they interfered with the churn-drill operations, since the holes required casing in sinking through the dumps and the old workings. The dumps were excavated for about 25c. per cubic metre by native hand-work, and the hardest rock was excavated for 80c. per cubic metre. During the earlier excavation stone hammers, wooden shovels, wooden gads, and the leather *capacho,* as well as mummies of the Indians themselves, were found. As soon as the natives discovered that these articles possessed a value in the eyes of the gringo curio-hunter, there was always a scurry by all hands after each large blast to gather the souvenirs of the prehistoric miners. A good collection of these curios is on exhibition at the Museum of Natural History in New York, together with a mummy of a miner upon whose body is precipitated a green coating of copper. The mummy was entombed for many hundreds of years, and the copper deposited upon him caused him to be called the 'copper man'.

It was a gala day for the natives on September 18, 1914, when they beheld the first steam-shovel starting to

work with its snorting and hissing of steam, and the bucket, which seemed so monstrous to them, loaded a train of 12-cu. yd. Oliver cars in little more time than it takes to tell it. Some were frightened, others, lost in admiration, stood and gazed at the machine, while the bolder ones among the native mechanics wanted to qualify as steam-shovel engineers. There are now being operated at Chuquicamata 8 or 10 steam-shovels, and about 15 locomotives, 1 electric shovel, 2 electric churn-drills, and about 12 steam churn-drills, all of which have been successfully manned by Chilean mechanics. The problem was difficult at the beginning, and required patience and encouraging words, and the training was accomplished in the face of much derogatory criticism. My experience with the native workmen in Chile more than confirmed the views of Henry Perkins, so forcibly stated in his interview with T. A. Rickard, published some months ago in the MINING AND SCIENTIFIC PRESS. The achievements of the better class of Chilean mechanic, even to the drilling of 1500 churn-drill holes with steel lines, goes to show that the men of the Southern Continent are well able to keep abreast of the times in the use of modern equipment. These Chilenos took particular pride in their work, and were very reliable; they were proud of their ability and realized the necessity of not missing a day, because the work of the machine depended on their punctuality. The Chilean laborer has an independent spirit, but at all times is subject to reason. He knows well enough when he is guilty of a breach, and he knows that the reprimand that he receives is justified. Much better results are accomplished by means of piece-work or on contract. In the operation of drilling-machines and steam-shovels, they were paid a bonus for work exceptionally well done. It is better to encourage and to lead the Chilean laborer than to attempt to drive him. It must be said also that I have never met with better workmen anywhere than the gangs of Chilean shovelers working on contract.

METHODS OF GAS WARFARE are interestingly described by S. J. M. Auld, in the Journal of the Washington Academy of Science. The following compounds are used by the Germans: For clouds, Cl and $COCl_2$; for hand-grenades, bromo and chloro-acetone, bromine, chloro-sulphonic acid, dimethyl sulphate, methylchloro-sulphonate, and SO_3; for shells, allyl isothiocyanate (allyl mustard oil), benzyl bromide, brominated methyl, ethylketone (bromo ketone), dibromoketone, mono and tri-chloromethyl chloroformate (palite and superpalite, respectively), nitro-chloromethane (chloropicrin or nitrochloroform), dichlorodiethyl sulphide (mustard gas), diphenylchloroarsine (sneezing gas), dichloromethyl ether, phenylcarbylamine chloride, $COCl_2$, SO_3, and xylyl bromide (tolyl bromide). For protection against chlorine cotton pads soaked in solutions of Na_2CO_3 and $Na_2S_2O_3$ were used. When the Germans started to use $COCl_2$ a helmet saturated with PhONa was developed, but the substance now used extensively by all is $(CH_2)_6N_4$, which, used in conjunction with PhONa, will protect against $COCl_2$ at a concentration of 1 to 1000 for a considerable period. The box type of respirator was developed as the use of gas-shells became extensive. It employs active absorbent charcoal and alkaline permanganate, which will protect against nearly everything used, even up to concentrations of 10% for short periods. The German apparatus has the chemical in three layers, an inside layer of pumice with $(CH_2)_6N_4$, a middle layer of charcoal (sometimes blood charcoal), and an outside layer of baked earth soaked in K_2SO_3 solution, and coated with finely powdered charcoal. It is not equal in efficiency to the American or British respirator, breaking down at a concentration of 0.3% of certain substances.

MUSTARD-GAS, which has been used so extensively in shells, is an organic compound containing chlorine and sulphur, known as di-chlorethylsulphide. It is employed in shells of all calibres up to eight-inch. It produces severe burns if it comes in contact with the body and is painful to the eyes. Food eaten after having been subjected to the influence of mustard gas has been known to burn the lining of the stomach. It is a heavy gas and has a fairly high boiling-point, 400°F., a fact that makes it unsuitable for cloud-attacks, for it must be vaporized by an explosion. The gas has killed men as far back as 12 miles from the front. Mustard-gas will linger a long time in the vicinity of shrubbery and woods and forming pockets in shell-craters, where it contaminates the earth, which often must be treated with chloride of lime if there is any chance of men coming in contact with it. With a favoring wind a mustard-gas shell can be shot over troops and dropped only 500 yd. ahead of them without placing them in danger. Gas-shell bombardment is to be expected everywhere within the range of artillery, in front-line trenches, communication trenches, camps, billets, and other places. The enemy's object, of course, is to catch bodies of men unprotected against gas and to develop a high concentration by heavy bombardment. The practice now is either to mix up the gas and the high-explosive shells, or to use gas-shells containing a fairly large charge of explosive. This makes it difficult to detect the beginning of a gas-bombardment.—'Metallurgical & Chemical Engineering.'

SAND-LIME BRICK production of the United States in 1917, according to the U. S. Geological Survey, numbered 187,546,000, valued at $1,420,330, a decrease of 39,798,000 brick, or 18%, and of $53,743, or 4%, compared with 1916. The drop was due principally to the general decrease in building operations, but in part to scarcity of labor and difficulties of transportation. The value of the output for 1917 was greater than the value of that for any other year except 1916. Sand-lime brick were made in 19 States by 47 operators. Michigan was the leading State, and reported more than one-fourth of the output and value; Minnesota was second. Common sand-lime brick represented 98% of the total output and value. The average price per 1000 for common sand-lime brick was $7.54, an increase of $1.11 over 1916.

The Duty of the Employer to the Crippled Soldier

By DOUGLAS C. McMURTRIE,
Director of the Red Cross Institute for Crippled and Disabled Men, New York City

We must count on the return from the front of thousands of crippled soldiers. We must plan to give them on their return the best possible chance for the future.

Dependence cannot be placed on monetary compensation in the form of a pension, for in the past the pension system has proved a distinct failure in so far as constructive ends are involved. The pension has never been enough to support in decency the average disabled soldier, but it has been just large enough to act as an incentive to idleness and semi-dependence on relatives or friends. The only compensation of real value for physical disability is rehabilitation for self-support. Make a man again capable of earning his own living and the chief burden of his handicap drops away. Occupation is, further, the only means for making him happy and contented.

Soon after the outbreak of hostilities the European countries began the establishment of vocational training schools for the rehabilitation of disabled soldiers. They had both the humanitarian aim of restoring crippled men to the greatest possible degree and the economic aim of sparing the community the burden of unproductivity on the part of thousands of its best citizens. The movement had its inception with Mayor Edouard Harriot of the city of Lyons, France, who found it difficult to reconcile the desperate need for labor in the factories and munition works while men who had lost an arm or a leg but were otherwise strong and well were idling their time in the public squares. He therefore induced the municipal council to open an industrial school for war cripples which has proved the example and inspiration for hundreds of similar schools since founded throughout France, Italy, Germany, Great Britain, and Canada.

The disability of some crippled soldiers is no bar to returning to their former trade, but the injuries of many disqualify them from pursuing again their past occupation. The schools of training prepare these men for some work in which their physical handicap will not materially interfere with their production. The education of the adult is made up largely of his working experience. The groundwork of training in his past occupation must under no circumctances be abandoned. The new trade must be related to the former one or be, perhaps, an extension or specialization of it. For example, a man who had done manual work in the building trades may by instruction in archictectural drafting and the interpretation of plans be fitted for a foreman's job, in which the lack of an arm would not prove of serious handicap. A trainman who had lost a leg might wisely be prepared as a telegrapher, so that he could go back to railroad work, with the practice of which he is already familiar.

Whatever training is given must be thorough, for an adult cannot be sent out to employment on the same basis as a boy apprentice. He must be adequately prepared for the work he is to undertake. The one-armed soldier is equipped with working appliances which have supplanted the old familiar artificial limb. The new appliances are designed with a practical aim only in view; they vary according to the trade in which the individual is to engage. For example, the appliance for a machinist would be quite different from that with which a wood turner would be provided. Some appliances have attached to the stump a chuck in which various tools or hooks can interchangeably be held. The wearer uses these devices only while at work; for evenings and holidays he is provided with a 'dress arm,' which is made in imitation of the lost natural member.

An important factor in the success of re-educational work is an early start, so that the disabled man shall have no chance to go out unemployed into the community. In even a short period of exposure to the sentimental sympathy of family and friends, his 'will to work' is so broken down that it becomes difficult again to restore him to a stand of independence and ambition. For this reason, therefore, the plan for his future is made at as early a date as his physical condition admits, and training is actually under way before the patient is out of the hospital.

In the readjustment of the crippled soldier to civilian life, his placement in employment is a matter of the greatest moment. In this field the employer has a definite responsibility. But the employer's duty is not entirely obvious. It is, on the contrary, almost diametrically opposite to what one might superficially infer it to be. The duty is not to 'take care of' from patriotic motives, a given number of disabled men, finding for them any odd jobs which are available, and putting the ex-soldiers in them without much regard to whether they can earn the wages paid or not, although this method is all too common. A local committee of employers will deliberate about as follows: "Here are a dozen crippled soldiers for whom we must find jobs. Jones, you have a large factory; you should be able to take care of six of them. Brown, can you not find places for four of them in your warehouse? And Smith, you ought to place at least a couple in your store."

Such a procedure cannot have other than pernicious results. In the first years of war the spirit of patriotism runs high, but experience has shown that men placed on this basis alone find themselves out of a job after the war has been over several years, or in fact, after it has been in progress for a considerable period of time. A second

weakness in this method is that a man who is patronized by giving him a charity job, comes to expect as a right such semi-gratuitous support. Such a situation breaks down rather than builds up character, and makes the man progressively a weaker rather than a stronger member of the community. We must not do our returned men such injury.

The third difficulty is that such a system does not take into account the man's future. Casual placement means employment either in a make-shift job as watchman or elevator operator such as we should certainly not offer our disabled men except as a last resort—or in a job beyond the man, one in which, on the cold-blooded considerations of product and wages, he cannot hold his own. Jobs of the first type have for the worker a future of monotony and discouragement. Jobs of the second type are frequently disastrous, for in them a man, instead of becoming steadily more competent and building up confidence in himself, stands still as regards improvement and loses confidence every day. When he is dropped or goes to some other employment, the job will have had for him no permanent benefit. Twelve men sent to twelve jobs may all be seriously misplaced, while the same twelve placed with thought and wisdom and differently assigned to the same twelve jobs may be ideally located. If normal workers require expert and careful placement, crippled candidates for employment require it even more.

The positive aspect of the employer's duty is to find for the disabled man a constructive job which he can hold on the basis of competency alone. In such a job he can be self-respecting, be happy, and look forward to a future. This is the definite patriotic duty. It is not so easy of execution as telling a superintendent to take care of four men, but there is infinitely more satisfaction to the employer in the results, and infinitely greater advantage to the employee. And it is entirely practical, even in dealing with seriously disabled men.

A cripple is only debarred by his disability from performing certain operations. In the operations which he can perform, the disabled man will be just as efficient as his non-handicapped colleague, or more so. In the multiplicity of modern industrial processes it is entirely possible to find jobs not requiring the operations from which any given type of cripples are debarred. For such jobs as they can fill the cripples should be given preference. Thousands of cripples are now holding important jobs in the industrial world. But they are men of exceptional character and initiative and have, in general, made their way in spite of employers rather than because of them. Too many employers are ready to give the cripple aims, but not willing to expend the thought necessary to place him in a suitable job. This attitude has helped to make many cripples dependent. With our new responsibilities to the men disabled in fighting for us, the point of view must certainly be changed. What some cripples have done, other cripples can do—if only given an even chance.

The industrial cripple should be considered as well as the military cripple, for in these days of national demand for the greatest possible output there should not be left idle any men who can be made into productive workers. With thoughtful placement effort, many men can be employed directly on the basis of their past experience. With the disabled soldiers who profit by the training facilities the Government will provide, the task should be even easier.

This, then, constitutes the charge of patriotic duty upon the employer: To study the jobs under his jurisdiction to determine what ones might be satisfactorily held by cripples. To give the cripples preference for these jobs. To consider thoughtfully the applications of disabled men for employment, bearing in mind the importance of utilizing to as great an extent as possible labor which would otherwise be unproductive. To do the returned soldier the honor of offering him real employment, rather than proffering him the ignominy of a charity job. If the employer will do this, it will be a great factor in making the complete elimination of the dependent cripple a real and inspiring possibility.

Wood and peat, after being partly dried, will yield a gas of 336 to 416 b.t.u., or after removing the CO_2, 450 to 560 b.t.u. The high CO_2 content is owing to oxygen contained in the fuel, but high-temperature carbonization tends to minimize its formation. To improve the product for the consumer a rich gas might be added; coal gas and oil being scarce, acetylene seems the most practical. About 15 volumes to 100 of poor gas would be sufficient, and the spent carbide from the acetylene production would easily form a source of milk of lime to remove CO_2 from the poor gas. Without enrichment wood or peat-gas may be burned with little or no primary air. Wood-gas liquors contain practically no NH_3, but approximately 1% of acetic acid; peat usually gives an alkaline liquor. Tars from both contain from 30 to 50% of H_2O, are poor in benzene and toluene, but rich in phenols. Wood-tars tend to produce stoppages; the heavier woods work best.—'Gas World.'

Japanese metallurgists, at the Hidachi copper works, according to Tetsurow Komakine, recently utilized a sack filled with hydrogen to examine the air currents at great heights above the smelting plant, and it is expected to furnish data to aid in solving the smoke question. At present the smoke is ejected from a stack over 500 ft. high, built on a mountain about 700 ft. above sea-level. It has been found that the gases are not equally dispersed, and that a great proportion may follow certain channels, which vary from time to time. Mr. Komakine further states that the 1000-ft. stack projected for some time at this works is now being built with the idea that the gases will pass out to sea before they fall. He adds that at the Ashio works, the Cottrell electro-static process precipitates the solid particles in the smoke but that additional processes are being developed to deal with the sulphur di-oxide. Neutralization by lime has been practised for years in Japan.

Saline Domes and Other Salt Deposits

By KIRBY THOMAS

The continued academic controversy as to the origin and nature of the so-called saline domes of the Gulf coastal plain gives point to observations on related and similar geologic phenomena in other regions. In southwestern Virginia are found extensive deposits of salt, associated with gypsum, that do not conform, in their geologic relations, to the salt deposits found in other parts of the world. These Virginian deposits are described and discussed in recent articles by George W. Stose, of the U. S. Geological Survey, published in Bulletin 530. The purpose of this discussion is to present sundry general conclusions concerning the Virginian deposits based upon investigations made by me when I was collecting physical data relating to the Union and other sulphur deposits associated with the domes of the Texas-Louisiana region.

My conclusion as to origin differs somewhat from those advanced by Mr. Stose and other investigators; therefore I submit my own idea tentatively. It appears to me that the deposits of gypsum and salt at Saltville, Virginia, are mostly secondary in character and that they were formed through the agency of circulating surface-water, which from the adjacent formations accumulated sulphuric acid from the oxidation of the iron pyrite therein, and dissolved from these or other formations the salt in them. The circulating water was held to these courses by the structural conditions, by the elevation of its sources, and by the overthrust fault. The result was a series of flowing saline and sulphur springs along the fault in favorable localities, the waters of which springs were charged with sulphuric acid and carried salt in solution. The approach of the chemical and salt-laden water toward the surface, and particularly the contact of the acid water with the soft, crushed, and soluble masses of limestone along the fault, resulted in the deposition of gypsum, replacing the limestone, and the precipitation of the salt, either from super-saturation or, as is more probable, because of the disturbance of equilibrium of the acid-salt solution by the chemical reactions noted. This assumption accounts for the limitation of the gypsum and salt deposits to a zone of narrow and varying width extending along the fault-plane and apparently in most instances dipping under the fault. The position of the salt below the gypsum is a characteristic feature of the Saltville district. The reason for this segregation and relation of these salt and gypsum deposits of common and probably contemporaneous origin is not easy to explain, but the likeness to the conditions that exist in the salt domes of the Louisiana-Texas region is significant.

The structural and stratigraphic relations in Virginia and on the coastal plain present noteworthy features of similarity. These can be studied more in detail by reference to the geological sections published in Mr. Stose's articles and in the paper on the domes by G. D. Harris, appearing in U. S. G. S. bulletin No. 429. In Virginia the ascending channel follows a fault; hence the deposits are elongated along the plane of faulting, with a much greater vertical dimension than width. The Virginian deposits are known to extend to a depth of 1200 ft. The shape and extent of the saline domes being roughly controlled by the junction of two fault-planes, they are generally circular or oval.

The presence of sulphur in the domes is due probably to the accidental presence of abundant organic matter in some of the limestone beds that have been affected in the course of the development and growth of the domes. Perhaps sulphur may be found by further exploration in the Virginian locality. Conditions are not unfavorable. The presence of oil in the domes I consider accidental rather than essential, the dome structures acting as a porous and cavernous receptacle with a sealed roof, which has arrested and accumulated the oil in its upward migration in a manner similar to the accumulation of oil in anticlines generally and in the quaquaversals of Wyoming and elsewhere. Similarly some oil has accumulated in the salt deposit, notably at Rogersville, Tennessee.

Interest in the interpretation of the Texas-Louisiana dome-phenomena in its bearing on the discovery of oil is justification for this presentation of the apparent analogy between the Virginian salt deposit and the domes, and I hope that it may incite a discussion that in turn may elicit further facts throwing light upon this subject.

CHARCOAL is recommended by the United States Fuel Administration as a substitute for coal in domestic use. The coal mines are in narrowly constricted areas, and transportation of coal burdens the railroads, but charcoal can be produced in every State. It is particularly adapted to household needs by a little modification of grates and stoves that any intelligent man can make. The Government has fixed the price of charcoal at 20 cents per bushel in carload lots, and at 22 cents in bags. That is equivalent to about $20 per ton. Although its heating power is slightly less than an equal weight of good bituminous coal, it burns steadily and freely without excessive draft, and produces its heat close to the coal, so that no wastage takes place in flame, and it proves far more economical where small fires are desired.

THE OUTPUT of the Australian metal industries for the next 10 years has been contracted. The second largest electro-zinc plant in the world has been erected, and it is reported that Great Britain has arranged to take the surplus of zinc concentrate for the next 10 years. Queensland has an abundance of copper and tin. More coal than gold has been mined there of late, and large deposits of wolfram have been discovered. New South Wales has coal, silver, lead, and gold. Much copper was produced there in 1917, and a plant for the manufacture of copper wire and other goods has been established at Port Kimble, sixty miles from Sydney. In Victoria 40 gold-mining companies have combined to insure more economical production.

REVIEW OF MINING

RENO, NEVADA

Proceedings at the Conference on Gold Mining.

Sixty-eight representatives of gold-producing States and Alaska organized under the name of the American Gold Conference assembled at Reno, Nevada, on August 12. Emmet D. Boyle, Governor of Nevada, presided. A committee, which included J. F. Callbreath, secretary of the American Mining Congress; Bulkeley Wells, manager of the Smuggler Union Mining Co., Telluride, Colorado; E. C. Hutchinson, of the Kennedy Mining & Milling Co., Jackson California; George W. Starr, manager of the Empire Mines Co., Grass Valley, California; H. N. Lawrie, of Portland, Oregon; Fletcher Hamilton, State Mineralogist of California; and J. A. Burgess, superintendent of the United Eastern Mining Co., Oatman, Arizona, drafted a resolution calling for Government aid to gold mining. The Conference was in agreement that the only practical method of relief, because it will not disturb financial conditions, consists in a bounty on the metal as produced at the mines. Other ideas were discussed but dismissed. The bonus will not undermine the basis of currency. The opinion of the conferees was that the increased cost of producing gold is about 40%. Statistics of cost at gold mines are solicited and are being collected for presentation to the War Industries Board. In our next issue we shall publish a full account of the Conference.

Gold production of Nevada continues to decrease this year, according to the mid-year report of the U. S. Geological Survey. Goldfield shows a further decline. The new producers at Midas and Jarbidge in Elko county, Omco in Mineral county, and Manhattan in Nye county promise well. Although silver districts, the increase of this metal at Tonopah and Virginia City results in a larger output of gold. The old National district yielded some rich ore.

PLATTEVILLE, WISCONSIN

Zinc Mining, Prices, and Production During July.

Operating conditions in the zinc-lead districts of Wisconsin were ideal during July, and conducive to at least normal production of ore; but a rather poor comparison with this month in former years. There were many factors responsible for the reversal of form. Markets for zinc ore were fairly firm and steady, though not as satisfactory as mine-owners desired; but demand at times was wholly indifferent. The labor situation was further aggravated by the exodus of hundreds of drafted men, many of whom were experienced miners. The region is one of the finest agricultural districts in the Middle West, and many farmers engaged in zinc-ore mining between planting and harvest have returned to their farms. Considerable labor was imported into the field from large commercial centres, but employers complained about the efficiency of the new help. A genuine scarcity of coal was partly responsible for the closing down of several low-grade producers, a situation that may be intensified as the season passes. A big reserve of zinc concentrate from June, conservatively estimated at not less than 10,000 tons, also acted depressingly. At the end of July this reserve was 12,000 tons. Notwithstanding these numerous drawbacks, operators were optimistic regarding the future zinc mining, and anticipated prosperity later in the year.

The month opened with premium grades of blende from refining-plants selling on a base of $75 per ton, 60% assays, for the product sold to sheet-metal manufacturers. Refiners sought this market keenly, and with fair results, most of the refinery product going in this direction. Concentrate assaying 60% metal for spelter manufacturers sold on a base of $52 most of July, at one time reaching as

MAP OF THE UNITED STATES SHOWING SITUATION OF IMPORTANT GOLD-PRODUCING CENTRES. THE MAIN DISTRICTS ARE ADJACENT TO THESE. BISBEE AND BUTTE ARE INCLUDED AS THEY YIELD LARGE QUANTITIES OF GOLD FROM COPPER ORE. THE MINTS ARE AT SAN FRANCISCO, DENVER, AND PHILADELPHIA.

high as $55. The latter price held for about a week, then receded to the more normal quotation. The range at one time dropped to $47.50, on second and inferior grades, but the better prices were maintained from a sort of mutual understanding between buyers and sellers. Low-grade producers found the Mineral Point Zinc Co. their most certain outlet. Prospecting was at a low ebb most of the period. Several mines shut-down indefinitely, while others closed for a time and operating with electrically-driven plants resumed. Only one new concentrator was started, At one or two points old plants were dismantled, the material being sold and shipped out of the field.

Lead-ore producers fared well. Prices opened in advance of $90 per ton, 80% metal content. Gains in the offerings were made until near the end of the month the price had advanced to above $100. Sellers felt that prices must go higher, and held to their product. Shipments were irregular. The reserve is estimated at not less than 2000 tons, some of which has been held over a year.

Shippers of pyrite maintained a normal tonnage, which came almost entirely from refinery plants. Shipments kept pace with production, and there was no reserve at the end of the month. Prices showed fair gains in favor of sellers in a position to accept open-market offerings. Two new sulphuric-acid plants, to be operated in connection with the Skinner roasters at New Diggings and the National Separators at Cuba are to be erected. The Leonard Construction Co. of Chicago received the award for both contracts, the terms calling for completion in 90 days, at a cost of $250,000 to $300,000 each.

For the first time this year there was a demand for zinc carbonate ore. Large deposits of this class of ore are available in the upper ground, and can be cheaply mined. A fair market would stimulate production greatly.

Shipments from mines to refiners in the field and from the smelters were made from July 1 to 27, inclusive, totaling 14,137 tons of zinc, 646 tons of lead, and 3200 tons of pyrite.

VICTORIA, BRITISH COLUMBIA

Labor Troubles.—Ore-Testing Plant.

Silverton.—Labor troubles, which threatened to disorganize work in the Slocan-Silverton districts, have been averted largely through the efforts of J. D. McNiven, Deputy Minister of Labour, in bringing employers and employees together. Near Silverton, among the better-known properties affected were the Standard, Van Roi, Hewitt, and Galena Farm, while both in this area and near Sandon there were a number of smaller mines which would have been tied-up if the men had left work. The unions at Sandon and Silverton, having a membership of between 600 and 700, first demanded a straight increase of 50c. per day, an 8-hour day for all surface workers—the same as those employed underground, recognition of the 'closed shop,' and provision for the collection of union dues by the companies. The result was the concession by employers of an all-round increase of 50c. per day. This amount is to be applied in full to those employees who board themselves, while those boarding at company houses will get an additional 25c. in cash and a similar amount will be added to their board account. The condition, therefore, now is that miners, mechanics, mill-men, concentrators, etc., are drawing $5, while shovelers, etc., receive $4.50.

Victoria.—Reference has been made in 'The Mining Summary' to the intention of the Dominion government to establish an ore-testing mill in British Columbia. It was thought that an appropriation of $40,000 would be made at the last session of the Dominion Parliament at Ottawa. This action, however, was not taken, so that the plant will not be started this year; but assurances have been received that financial support will be forthcoming in 1919.

AUSTIN, TEXAS

The Importation of Laborers From Mexico.

Laborers are being brought across the Rio Grande in increasing numbers each day and distributed throughout Texas, even to more remote parts of the country. As a source of labor supply for the farms, mines, railroads, and war industries of the United States, Mexico can be drawn upon to the fullest extent. Of the 15,000,000 population of the republic, approximately 12,000,000 are of the peon or working class, most of whom are without steady employment and lead a hand-to-mouth existence. Under the new immigration regulations many thousands of the laboring element of Mexico have entered the United States during the last few weeks. Employers of large forces are interested in keeping up with the changes that have been made in the restrictions and regulations governing the importation of Mexicans. A statement just issued by E. P. Reynolds, U. S. Immigration Inspector on the Rio Grande border, says: "The latest changes provide for Mexican laborers to be imported under contract for the purpose of engaging in mining of any and all kinds, or to be employed in the performance of common labor in connection with construction work being done by or for the United States government. Another important change is that employers are no longer required to deposit in the postal savings bank 25c. per day out of each contract laborer's wage, there to remain until such laborer returns to Mexico. These are all the changes in the regulations governing the admission of Mexican laborers which have been recently made, and otherwise the regulations are in full force and effect. It is now permissible to bring in Mexican laborers under contract, and without regard to the head tax and illiteracy provisions to engage in the following occupations only: strictly agricultural work, railway-maintenance work, mining work, or in construction work being done by or for the United States government. If the laborers so brought in, are afterward found engaged in any other kind of work, they are subject to immediate arrest and deportation. In order to obtain a waiver of the head tax, illiteracy test, and contract labor provisions of the immigration laws, the prospective importer or employer of labor must first go to the U. S. Employment Officer located nearest the place where the prospective laborers are to be employed, and there secure from said United States Employment Officer a letter authorizing the importation of a specific number of laborers, and for a specified purpose. This letter must then be presented to the immigration officers at the 'port' of entry, and the employer or his duly authorized agent must then bring in his laborers from Mexico, or at least meet them at the port of entry and there take charge of them. Before the employer can be permitted to import foreign labor under these exceptions he must first execute a contract with the United States, binding himself to keep these laborers engaged either in agricultural work or in railway maintenance work, or mining work, or in construction work being done by or for the United States government. He must also bind himself to report monthly to the inspector in charge, immigration service at the port of entry, the names of all such aliens together with their identification card number and their occupation, and if they leave his employ he must report such fact immediately. The employer or importer must also furnish photographs and printed identification cards covering all such laborers admitted. No importations are to be permitted under our instructions unless the importer first executes the above mentioned contract, and first receives authority from the appropriate United States employment officer. Also, the employers are responsible for the return of their laborers to Mexico at the expiration of their term of employment without expense to the Government."

During the first half of 1918 some copper ore was mined from the 'Red Beds' of Foard and Knox counties, of Texas.

ALASKA

Cordova.—In Bulletin 675 of the U. S. Geological Survey, Fred H. Moffit and R. M. Overbeck describe the upper Chitina valley and the igneous rocks. The area of this region is 1200 square miles. As the reconnaissance surveys of the developed districts in the Copper River basin were completed, the work has been extended into adjacent areas. The upper Chitna was surveyed in 1915. According to Alfred H. Brooks in the preface, copper-bearing rocks occur in this region. The formations from which the Nizina placers derived their gold occur in this area. On the other hand, no mineral deposits of proved value have yet been exploited in the upper Chitina basin. However, little prospecting has yet been done.

Juneau.—Alaska Gastineau during July treated 74,830 tons of $1.319 ore. The recovery was 82.03%. Returns for the year are as under:

Month	Tons	Value per ton
July	74,830	$1.319
June	82,600	1.250
May	101,200	1.114
April	125,435	1.148
March	150,093	1.114
February	140,305	0.934
January	179,300	0.903

Port Chatham.—An old stamp-mill is being erected by the Whitney and Lass interests at their chrome mine near this place.

Treadwell.—The Sheep Creek and Nugget Creek hydro-electric plants of the Treadwell group have a large surplus of power, so part of it is now used in generating steam in an 'electric boiler.' This is 30 in. diameter and 108 in. high, standing on end. The voltage is 2300, single-phase, alternating current. A steel shaft 6 in. diameter is suspended vertically in the centre of the boiler, insulated from the shell, except from the circuit completed by the water. The path of the current is first from one line through the centre shaft, then through the water to the boiler-shell, then on to the other line. There are no coils at all. Little attention is necessary. A silimar but smaller boiler is being fitted at the Alaska Juneau plant.

ARIZONA

The mines and smelters of Arizona were gradually regaining their normal rate of production during the first months of 1918, and toward the middle of the year they had considerably surpassed it, according to V. C. Heikes of the U. S. Geological Survey. A larger output of gold, silver, and copper may be expected this year, but less lead and zinc.

Jerome.—Following is the building program that the United Verde Copper Co. is pledged to the U. S. Department of Labor to carry out: Emergency and pneumatic hospital at Clarkdale, ready about Thanksgiving; apartment building to be built here, of thirty-three 3 and 4-room apartments, ready in February next; eight patio groups (six 3-room houses providing rooms for 48 families), ready in January, at Clarkdale; twenty 5-room houses with two sleeping porches to be built at Clarkdale, ready in January; completion within 60 days of old hospital building at Jerome, furnishing room for 60 single men; twenty 4-room houses to be erected at Jerome, depends on railroad construction for time of completion; steam-shovel camp, four 16-room bunk-houses (concrete), for 64 single men, within 6 months; and the Clarkdale club-house, for which plans are being prepared.

Walker.—The Black Diamond company has purchased a new steam-driven drilling plant and compressor. Plans for sinking 500 ft. are completed. It is estimated that $100,000 of ore is blocked out above the 200-ft. level.

The Bannie mine's new compressor plant is working well, a carload of ore assaying 21% copper, 20 oz. gold, and 12 oz. silver, is being shipped this week.

The Mud Hole Gold Mining Co. has been incorporated by W. C. Lacey and William Casey, to take over holdings and mill of the old Mud Hole company. The capital is $1,000,000, shares $1 par. The mill is being overhauled to treat a large quantity of low-grade gold ore in old workings. The Mud Hole produced $325,000 in high-grade ores above the 300-ft. level, previous to labor troubles 12 years ago.

The Amulet silver mine recently made a shipment of ore carrying 200 oz. per ton, and some gold. The General Mines Co. is working this property, C. N. Brown being in charge.

The Virginia silver mine is opening well. The owner, W. A. Crank, states that a trial shipment returned 82 oz. silver and 27% lead. Sinking is under way.

The Star molybdenum mine, owned by John T. Burris, was the scene of much excitement recently when native silver was found.

The 97 group of three claims was sold this week by W. A. Crank and C. J. Kerr to a St. Louis capitalist, who will increase the output of molybdenite, which assays from 1.8 to 3% across a 12-ft. vein on the 97 claim proper.

CALIFORNIA

Dedrick.—Statements published in the daily press to the effect that the Globe mine near here was shut-down and that the plant was to be sold are incorrect. Only a few men are working, but development continues. H. M. Hall of San Francisco is owner.

Folsom.—Chrome mining in the Negro Hill district, 7 miles from here, is said to be employing 100 men. The weekly output of all operators is three carloads of ore. Eight auto-trucks are used to haul it to rail.

Grass Valley.—Mine-owners in this district selected G. J. Rector, president of the Nevada County Bank; J. B. Stapler, superintendent of the Champion mines at Nevada City; and W. E. Wright, secretary of Nevada City Chamber of Commerce to attend the gold conference at Reno on August 12. A. B. Foote and G. W. Starr also attended.

Junction City.—From this place in Trinity county 3000 ft. of 36-in. steel pipe, long in use by the Cse Fse Hydraulic Mining Co., is being trucked to the Singletown region of Shasta county, a distance of 110 miles, where it will be used by the Northern California Power Co. This pipe was laid in 1882, when it formed a siphon for this French company. When the Cse Fse shut-down for good in 1898, the pipe ceased to serve any useful purpose. For twenty years it has lain exposed to the weather, yet it is in good condition. The Northern California Power Co. will use the pipe to replace wooden stave-pipe at its Volta power-house near

Shingletown, and to make a pump-line at Baldwin creek, where it is pumping water from the creek to its ditch feeding the power-plant at Coleman. The company expends 200 hp. in pumping water that will generate 1000 hp. at its Coleman plant.

Castella.—Neeley brothers' chrome mine, 22 miles west over the divide in Trinity county, is keeping three auto-trucks going hauling chrome to Castella. Seven more trucks are to be employed at once. Edward H. Martin is superintendent with 25 men.

Markleeville.—Copper properties in this district of Alpine county have been examined this summer by engineers representing Eastern capital. Lack of rail transportation is a drawback to development. Some high-grade copper and silver deposits are being mined on a small scale.

San Luis Obispo.—Chrome mining in this county is now an important industry, according to the 'Daily Telegram,' published here. The Goldtree station is shipping 1500 tons monthly, also some from Santa Margarita and San Luis Obispo. About 300 men are employed in mining and shipping the ore. The best deposits are in the range west of Cuesta Pass, extending up the coast to San Simeon. The large producers are the Pick & Shovel, Trinidad, London, and Castro, originally worked years ago. Others are the Union and Pierce on San Bernardino creek. The Pick & Shovel is worked by tunnels. Thirty-five men are employed, in charge of G. W. Nicholson, who is also at the Trinidad. A 20-ton concentrating plant is being erected. Ore is hauled to rail at Goldtree. Ore in the Trinidad is found at a depth of 200 ft. on the incline. Fifteen men are at work. The London mine of W. C. H. Dibblee and P. A. H. Arata is operated by tunnels. A small mill is to be erected. The California Chrome Co. operates the Castro mine, all by open-cut method. A mill concentrates the low-grade ore.

Weaverville.—The Lagrange mine, once the greatest hydraulic mine in the world, has been shut-down for good.

GIANT AT WORK AT LAGRANGE MINE, NOW SHUT-DOWN.

All movable plant is to be sold. The War has hastened the end, which would have come in a few years. One trouble was the proximity of the main reservoir to the workings. To alter this would cost a large sum. Rails for riffles may be difficult to secure. The company has just made its final clean-up, said to have been a good one. Twenty-three miles of flume, ditches, and pipe convey water from far up Stuart's fork to the mine. The pipe will be sold, but the valuable water-right will be preserved and may be utilized in generating electric power. The Lagrange, situated on Oregon Gulch mountain, four miles west of Weaverville, has been in operation for forty years. A whole mountain has been washed down. The anti-debris law that closed nearly every hydraulic mine in the State a few years ago made no difference to Lagrange, as there is no farming land down Trinity river for the debris to damage. The closing of the mine is a severe blow to Weaverville, which derived a good deal of trade from the 40 men usually employed in or around the mine.

COLORADO

Cripple Creek.—Gold output of the district during July totaled $912,110, from 96,710 tons of ore. Dividends amounted to $272,000.

Lake City.—The old Hidden Treasure mine, of great reputation in early days of Gunnison county and later known as the Oriental, has been taken over by the McCarthy-Hidden Treasure Mining Corporation of Omaha and Council Bluffs. There has been several thousand feet of development done on seven levels. Ore is conveyed 3800 ft. to the mill by a Bleichert aerial-tram. The length of the cross-cut tunnel is 3700 ft. from portal to vein. The average width of vein is 30 in. Concentrate assays $90 to $100 in silver, lead, and gold. The mill includes a crusher, rolls, jigs, ball-mill, Wilfley tables, and a flotation plant. Three Callow tanks were put in recently. Water and steam combined has a capacity of 1000 hp. The machinery comprises a 50-kw. direct-current generator for hoist, 75-kw. alternating-current generator for mill, 100-kw. alternating-current generator in reserve, and a 24-drill Ingersoll-Rand air-compressor driven by a 150-hp. Pelton water-wheel. Waugh drills are used in the mine. Officials are E. L. Thomas, Omaha, president and manager; T. A. O'Brien, superintendent of the mine; E. F. Gustafson, superintendent of the mill; W. A. McCarthy, electrician; and R. F. Stenson, office manager.

Gunnison.—The mineral holdings of the Searchlight Oil & Mining Co. are in the Goose Creek district, extending from Spencer to the Cebolle river, and consist of 10 claims, a mill-site, tunnel-site, and water-right for the immense projected reservoir on the river. At a point 75 ft. above the river the Smoot or main tunnel is in 150 ft., and is being driven toward a chimney, the outcrop of which is 368 ft. above the tunnel. A large body of copper and silver ore is expected to be there. The Searchlight company also owns the Smoot gold and sulphur mine, one mine south of the Cebolla river. Two other claims of the company are four miles from the Smoot entrance, in a direct line with the producing Iron Cap and Copper King mines. Shafts are down on a rich copper and gold shoot 10 ft. wide. Arthur G. Dominy of Boston is president; Robert E. Magee of Gunnison is general manager.

The Anaconda company, 1½ miles north-east, has developed its copper ore to a depth of 200 ft., and is shipping high-grade material.

Workings of the Headlight company are down 200 ft. in a wide lode. This property is owned and operated by a Cincinnati brewing firm, which purposes erecting a smelter.

Ohio.—On Volunteer mountain in Gunnison county less than four miles from this place are the 800 acres of the Carter Mines Co., with W. D. Murdie in charge. A 9000-ft. tunnel has been driven to an 1100-ft. raise of the shaft-workings of the old Volunteer mine, originally sunk on a strong vein of copper-iron sulphide ore between granite walls. With the present scarcity of labor the output is only 20 tons daily. A stream and reservoir supplies water to drive three Pelton wheels. One Pelton operates a Westinghouse 17-kw. d.c. dynamo for electricity used in the workings. Another 150-hp. wheel drives the Ingersoll-Rand compressor, generating 130 lb. pressure and operating 10 Leyner drills. A commodious mill building, situated near the tunnel portal, contains ore-bins, automatic-feeders, a 9 by 15-in. Blake crusher, 20 stamps, and 5 Wilfley tables. The stamps and tables are also operated by a 100-hp. Pelton wheel. Eleven levels, 100 ft. apart, have been driven 300 ft. north and south each from the raise, which is of four compartments, 4½ by 4 ft., equipped with a cage. Ore is sent down chutes on one side.

IDAHO

Though much is heard concerning increased cost and shortage of labor in 1918, many of the big mines of Idaho continue to increase their shipments, according to C. N. Gerry, of the U. S. Geological Survey. The total yield of metal, however, has probably fallen off in the first half of 1918. The increase in the price of silver does not offset the decrease in the price of lead, for lead is Idaho's main output. Ore and concentrate from the Coeur d'Alene district, including lead, zinc, and copper material, were shipped at the rate of about 44,000 tons per month during the first half of 1918.

Wallace.—Miners at the Morning and Gold Hunter mines quit work on August 6. A majority of the strikers were earning $7.65 to $11.65 per day on contract work. They struck for an eight-hour day from portal to portal of the mines, a pay-day twice a month, and a Sunday off on pay once each month. On the 8th it was reported that the men had resumed work pending settlement.

The Success zinc-lead mine has been unwatered to the 1600-ft. level, after being flooded for three months. Development is to be continued at 1500 and 1600 ft. It is said that more favorable terms have been arranged with the smelter.

MISSOURI

Joplin.—Production of the region last week was 8366 tons of blende, 140 tons of calamine, and 1667 tons of lead. These averaged $49, $35, and $101 per ton, respectively. The value was $591,237, making $14,781,288 for 31 weeks. Missouri contributed $111,336 to last week's return.

MONTANA

Reports of the production of copper in Montana in 1918, according to V. C. Heikes, U. S. Geological Survey, indicate that the State will this year make an output equal to that of 1916, which was more than 352,000,000 lb. The output in 1917 was about 278,000,000 lb. There was much interest in the mining of lead ore in Montana in the first half of 1918, especially in the Helena and Rimini districts. The increase in the output of copper assures a corresponding increase in the output of gold and silver. There is every indication that the output of zinc in Montana in 1918 will be larger than in 1917, though the price was lower during the first part of the year.

Big Timber.—Mines of the Boulder River Chrome Co., on the Boulder river, 35 miles from this place in Sweet Grass county, are reported to have been sold to Oscar Rohn, general manager for the East Butte Copper Co., for a large sum. It is said that the Boulder River deposits are the only workable ores in the United States outside of California and Oregon.

Butte.—On the 825-ft. level of the Tuolumne company's Main Range mine, on the east side of the district, a wide shoot of 4.7% copper and 12.5 oz. silver ore has been opened. This is supposed to be the downward extension of the ore at 700 ft. Sinking of the main shaft is to be resumed soon. This company is employing 100 men at its properties. Net earnings in July were $5000. Ore shipments are from 100 to 150 tons daily.

The Butte East Slope Mining Co. has published its prospectus. The capital is $500,000, shares $1 par. E. P. Lomas is president; Martin Flyth, vice-president; and C. B. Lomas, secretary-treasurer. The property consists of 5 claims in Jefferson county, just east of Columbia gardens in the Butte district. Two veins are said to carry gold and silver near the surface, and copper at 160 ft. The shaft is to be sunk to 500 feet.

Libby.—The Lukens-Hazel Mining Co. is to erect mining and milling machinery, and a hydro-electric plant, said to cost $150,000, of proposals are carried out. The mine contains a large quantity of gold-silver-lead ore. The directors are C. E. Lukens, president and treasurer; John H. Town, vice-president; Williamson Jennison, secretary; H. L. Faust of Libby and Oscar Nordquist of Spokane.

Saltese.—The Tarbox mine in the east Coeur d'Alene region, is opening extremely well. The main shaft is down 800 ft., and below this level a 200-ft. winze is being sunk. On the 800-ft. level a large lead-silver-zinc vein has been opened, estimates giving 110,400 tons between this and the 600-ft. level. A 100-ton mill is being considered. The property has extensive water and timber rights.

NEVADA

In 1917, mines of Nevada produced metals valued at $53,000,000, the greater part of which was for copper, according to V. C. Heikes, of the U. S. Geological Survey. The output of copper will be considerably greater in 1918 than it was in 1917 if the present rate of shipping and smelting is maintained, but the output of lead and of zinc will probably be much less, as shipments from the principal centres have been greatly reduced. The output of gold has been decreasing for several years, and the output of silver also decreased in 1917. Shipments of bullion, ore, and concentrate, during the first six months of 1918 indicate that the production of gold continued to decrease, though every effort was made to market silver ore and bullion on account of the advance in the price of silver. The promising gold fields are at Midas, Manhattan, Omco, and Jarbidge. The silver districts of Rochester, Tonopah, and Virginia City are making good yields.

MILL OF ELKORO MINES CO., AT JARBIDGE, NEVADA; A SUBSIDIARY OF THE YUKON GOLD COMPANY.

Ely.—The Consolidated Coppermines Co. has issued its report for the year ended December 31, 1917, and for four months ended April 30, 1918. The general manager is Robert Linton; general superintendent, H. S. Munroe; and consulting engineer, E. F. Gray. The property was examined by E. J. Collins of Duluth, Minnesota, in April and May 1918. The total value of metals produced in 1917 was $2,473,439. Current assets on April 30, 1918, were $2,916,459, and liabilities $1,344,817, against $2,936,240 and $1,163,017 at the end of 1917..

The Norris-Brooks mine yields sulphide concentrating and direct-smelting sulphide ores, and the Alpha direct-smelting oxide ore (8%). In the former 23,908 ft. of work was done. The branch-raise system of caving is in use. The Alpha has been opened by a 12 by 19½-ft. shaft, 1440 ft. deep. Reserves in all mines total 20,092,800 tons, averaging 1.31% copper. During 1917, 343,120 tons of ore produced 9,801,252 lb. of copper, 7031 oz. of silver, and 2545 oz. of gold. The re-modeled Kimberly mill dressed 145,466 tons of this ore, averaging 1.69% copper. The ratio of concentration was 12.2 into 1, and recovery 73%. The Nevada Consolidated mill also handled 174,056 tons of 1.36% ore, the ratio being 10.12 into 1, and recovery 59.86%.

During the first four months of 1918, 133,635 tons yielded 4,601,885 lb. of copper, 5345 oz. of silver, and 1112 oz. of gold. Lessees extracted ore containing 131,215 lb. of lead and 109,510 lb. of manganese.

Hornsilver.—The companies and lessees in this district are employing 100 men. The Silvermines mill is treating ore from a number of properties. The principal operators are the Silvermines, Orleans, Nettie L., Silver King, and American.

Manhattan.—The White Caps main shaft is to be sunk 150 ft. below No. 5 level. All timber is on the ground. A hoist on No. 5 will permit of sinking without delaying ore extraction.

NEW MEXICO

Lordsburg.—The Great Eagle fluorspar mine, at Red Rock, 30 miles north of here, is said to be under negotiation for sale for a large sum. Canthers and Connors are owners.

OKLAHOMA

Miami.—Following the suggestion of James McNichols of the Oklahoma Engineering Co., an ore exchange will probably be created here. The idea is to trade in warehouse receipts for zinc and lead concentrates stored but not sold. Local bankers are said to favor the arrangement, as they can lend money on warehouse receipts. The 'ore pit' will be held in the lobby of the Hotel Miami.

Picher.—Production of the districts last week totaled 6509 tons of blende and 1348 tons of lead, valued at $460,401.

St. Louis.—The Jupitor 200-ton mill of the Huttig Lead & Zinc Co. was burned on August 3. The loss is over $80,000.

UTAH

Advance figures of the U. S. Geological Survey, through V. C. Heikes, of the mine production during 1917, have been issued. A comparison of the past four years is as under:

	1917	1916	1915	1914
Producers	334	318	234	214
Ore treated, tons	15,358,481	13,920,643	10,451,445	8,544,014
Gold, ounces	162,306	172,938	174,591	157,961
Silver, ounces	13,479,133	13,253,037	12,313,205	11,154,916
Copper, pounds	246,674,153	240,275,222	187,671,188	152,034,002
Lead, pounds	178,521,958	201,490,075	199,967,437	171,323,137
Zinc, pounds	21,286,871	29,572,528	24,292,240	15,989,267
Value	$99,328,155	$89,268,684	$55,105,070	$37,151,253

Salt Lake county was far ahead of all others in all metals, accounting for 75% of the total value. Juab followed with 10%. Beaver and Tooele counties have 60 and 61 producers, respectively, yielding $2,180,651 and $3,253,492.

Alta.—A new wage-scale has been adopted in the Alta-Cottonwood districts. The average increase is 50c. per day. The lowest wage is $4.50—for laborers—and highest $5.50 for machine-drillers. Board is up 10c. per day to $1.35.

Eureka.—The new shaft of the Chief Consolidated is to be lined with concrete instead of timber. This is the first concrete shaft in Utah. The new pumping plant at the other mine is working well.

Lark.—Part of the Ohio Copper Co.'s mill here was burned on August 10, the damage being $75,000.

Tintic.—Ore and concentrate production of this district in July totaled 620 carloads, or about 24,800 tons.

WASHINGTON

Early in 1918 the mines in Washington were continuing shipments of ore at the rate that prevailed in 1917, according to C. N. Gerry, of the U. S. Geological Survey. The gold output for 1918 should be normal; silver will show no great increase; while copper and lead should report increases.

Northport.—The Electric Point company is shipping a car of lead ore daily. The shaft is to be sunk to 1000 ft., where sulphides are expected.

Spokane.—Announcement of a gold convention to be held here soon has been made by the Northwest Mining Association. The purpose is to gather and disseminate information in support of the Federal government's request to stimulate the production of gold throughout the country. The date and features of the convention will be announced shortly.

The gold conference mentioned above is to be held here during the week of September 2 to 7. It will be held under the auspices of the Northwest Mining Association, whose committee consists of F. A. Ross, A. W. Boyd, F. C. Bailey, and Sidney Norman.

Inability to secure mining machinery is seriously retarding the development of many properties in the North-West. The demand on machinery houses for war purposes has depleted stocks, and factories are far behind on orders. Sometimes mining men, despairing of having orders filled, scout around and find used machinery which is available. A recent instance occurred in the Oroville district, when the Oroville Copper Co. wanted equipment. The manager found what he wanted at the old Republic mine, at Republic. He purchased a 75-hp. compressor, motor, and receiver, at a big saving. The machinery had been used only a little over a year.

CANADA

British Columbia

Britannia.—At the Britannia mine the new mill is reported to be dressing between 2200 and 2300 tons of ore per day. It is reported to be making a recovery of between 94 and 95%. The Howe Sound Co. has opened what is termed Mammoth bluff as a quarry, marking the commencement of the mining of Britannia mountain. The greatest problem in connection with operations is the shortage of labor. There now are only approximately 850 men on the payroll, against 1000 normally. The company is planning to place its entire system of ore transportation underground.

Kaslo.—B. F. Millard of Seattle, who has purchased from A. G. Larson of Spokane and associates, manganese properties here, is resuming operations with 30 men. He is erecting a drying-plant for the ore, to reduce freight charges on the product, which is shipped to Pennsylvania. In some lots shipments contained 40% water. There is 2000 tons available, estimated to average 42 to 45% Mn.

Trail.—The smelter here has received 200,237 tons of ore in the first seven months of 1918, against 200,145 tons in 1917. During the second half of July there was reduced 7614 tons.

Tulameen.—With further reference to prospecting for

platinum, it is authoritatively reported that the Munitions Resources Commission of the Dominion government has a drill at work on the Saskatchewan river and another on the Peace river. The Tulameen river is to be thoroughly tested, two drills being on the way. It is understood that there already are two drills at work in the placer ground of this river. Eugene Poitevin, a mineralogist attached to the Department of Mines at Ottawa, has returned after spending a few weeks at Olivine mountain, near Tulameen. The gold and platinum has not been carried a great distance, and it is suggested that the Government place a diamond-drill to prospect some of the outcrops on the mountain. There are many prospectors camped along the Tulameen river near the mountain and a number of claims have been staked.

Windermere.—The mines of this district will have a busy season ahead of them. Several have shipments on hand ready for release as soon as roads permit. The Hidden Treasure, which was sold last fall to a Calgary syndicate, will be opened on a more extensive scale. A carload of high-grade copper and silver ore awaits treatment.——The Lead Queen, No. 3 creek, intends shipping as soon as the season opens.——The Isaac, on Frances creek, has several cars ready.——On the dump of the Sitting Bull group, Boulder creek, there is a quantity of high-grade galena.

Manitoba

Falcon Lake.—Tungsten deposits near here are described in the 'Canadian Mining Journal' of June 1 by J. S. DeLury. The area is north-west of Shoal lake, near the Ontario boundary, and was prospected for gold several years ago. Molybdenite was investigated there in 1917. The district is midway between the main line of the C. P. R. line and the Greater Winnipeg Water District Railroad. By good canoe routes and trails the prospects can be reached from either line in a half-day. Rocks consist mainly of ancient schists and a later intrusive granite series. Pyrite, pyrrhotite, chalcopyrite, arseno-pyrite, sphalerite, and galena occur in the rocks. The zones that carry the scheelite should be fairly continuous. Epidote (silicate of alumina) is the characteristic gangue mineral. The scheelite is pure white, but sometimes it is pale pink or red. So far, the tungsten ore found is confined to a band in the schist parallel to the granite contact. This band is 3 miles long and ½ mile wide, and has nearly all been staked; but there is no reason why the tungsten-bearing zone should not have greater limits. Development of the molybdenite deposits is considered promising.

Ontario

Cobalt.—Dividends paid by local companies during the first half of 1918 totaled $2,475,055, as under:

Coniagas	$200,000
Kerr Lake	300,000
LaRose	30,000
Mining Corporation	727,271
McKinley-Darragh	202,293
Nipissing	900,000
Penn-Canadian	40,491
Temiskaming	75,000

Porcupine.—Dividends paid by local companies during the first half of 1918 total $607,028. The McIntyre paid $361,028, and the Hollinger $246,000. The Hollinger pays 1% on August 12. This is equal to $246,000.

Yukon

Mayo.—Rich silver ore is said to have been opened in the Lookout Mountain mine of J. Pickering and others. Several other claims in this district are reported as having good indications. The Silver King, 30 miles away, has been a large producer.

KOREA

Unsan.—The Oriental Consolidated paid 25c. per share on July 26. The June clean-up yielded $144,000.

PERSONAL

Note. The Editor invites members of the profession to send particulars of their work and appointments. This information is interesting to our readers.

David T. Day is here.

L. D. Ricketts was here last Monday.

Tom Lee Ball has enlisted as a pilot in the Naval Aviation Corps.

T. M. Lowry, Major in the British army, has been awarded the D. S. O.

F. M. Manson, of the Western Ore Purchasing Co., Nevada, is here.

Charles Lehman has left Naltagua, Chile, and has returned to England.

Robert A. Watkins, editor of the 'Arizona Mining Journal' passed through San Francisco.

Courtenay De Kalb, after attending the Gold Conference at Reno, has gone to Ely, Nevada.

A. P. Watt has been elected to membership in the Mining & Metallurgical Society of America.

Allen H. Rogers, of Boston, spent the week in San Francisco, on his way to British Columbia.

C. A. H. DeSaulles succeeds **L. G. Eakins** as manager in Colorado for the A. S. & R. Company.

Charles W. Stimpson and **E. Shores**, of Salt Lake City, were in San Francisco for a few days.

Lloyd C. White, mill superintendent for the Mountain Copper Co., was in San Francisco this week.

C. H. Brainerd, of the Brainerd, Fairchild Engineering Co., is examining zinc properties in Oklahoma.

L. J. Mayreis has resigned as assistant-manager for the Burma Mines company and is on his way to New York.

C. W. Purington and **Millard K. Shaler** have been appointed consulting engineers to the U. S. Bureau of Mines.

A. E. Drucker has completed a series of leaching and electrolytic zinc investigations for the Consolidated Interstate-Callahan Mining Company.

K. B. Thomas, superintendent of the sulphuric-acid department of the Calumet & Arizona Mining Co., is taking a short holiday in San Francisco.

R. Arthur Thomas has resigned as resident manager of Dolcoath, becoming managing director. The company is advertising for a resident manager.

Albert R. Ledoux has been appointed chairman of the Chemical Alliance Committee on the Production, Distribution, and Control of Sulphur Minerals.

L. R. Boyer, formerly with the U. S. Bureau of Standards, has joined the organization of E. & T. Fairbanks & Co., scale manufacturers, St. Johnsbury, Vermont.

D. R. Thomas has resigned as assistant-manager for the Moose Mountain, Ltd., and is now advisor to the American Cyanamid Co., at Niagara Falls, Ontario.

R. Williamson has been made general manager of Block 10 Misima Gold Mines, at Missima, New Guinea, replacing **O. B. Ward**, who resigned owing to serious illness.

H. W. Aldrich has resigned from the Anaconda Copper Mining Co. to become assistant general superintendent for the Inspiration Consolidated Copper Co., at Miami, Arizona.

L. G. Eakins, general manager of the Colorado branch of the A. S. & R. Co., has resigned his post at Denver and will serve as consulting metallurgist to the smelting company in New York. He is now in San Francisco.

M. R. Park, Flight-Commander of the Royal Flying Corps, has been awarded the Croix de Guerre and the Military Cross for exceptional service in France. He is the youngest son of James Park, of New Zealand, well known as a mining geologist, and the author of several works on assaying, geology, metallurgy, and mining.

THE METAL MARKET

METAL PRICES

San Francisco, August 13

Aluminum-dust, large and small lots, cents per lb.	65—70
Antimony (wholesale), cents per pound	15
Copper, electrolytic, cents per pound, in carload lots	26 00
Copper, electrolytic, cents per pound, in small quantities	27 35
Lead, pig, cents per pound	8.30— 9 30
Platinum, Government price, per ounce	$105
Quicksilver, per flask of 75 lb.	$120
Spelter, cents per pound	11
Zinc-dust, cents per pound	17½

The Mint at San Francisco has been authorized to receive crude or manufactured platinum for Government purposes.

ORE PRICES

August 13

Antimony, 45% metal, f.o.b. California, per unit	$1 10
Chrome, 38 to 48%, California, per unit	$1.25—$1 50
Fluor-spar, 85% CaF_2, f.o.b. shipping point, or San Francisco per ton	$22—$30
Magnesite, crude, California, per ton (nominal price)	$7.00—$8.00
Manganese, domestic, 35 to 54%, f.o.b. South Chicago, per unit (Government price, effective May 29)	$0.86—$1.30
Manganese, domestic, 35 to 54%, f.o.b. east of South Chicago, per unit (Government price, effective May 29)	$1.01—$1.45
(Manganese, domestic, penalty of 50c to $1 per ton for 8% and up to 25% silica, and bonus of 50c. to $1 for less than 8 and 5%.)	
Molybdenite, per lb., 85% MoS_2	$1.00
Pyrite, per unit of sulphur, cents	28—32
Tungsten, 60% WO_3, California, per unit	$20—$24

In 'Mineral Foot-Notes' for July-August it is stated that 90 to 95% molybdenite, entirely free from impurities, is worth $1.50 per lb., and that the price approximating $1 per lb. is for offerings of lower-grade product, for which there is practically no demand.

EASTERN METAL MARKET

(By wire from New York)

August 13.—Up to the time of going to press our weekly metal telegram had not arrived. As most of the prices are fixed, there can be few changes.

COPPER

On September 21, 1917, the Government fixed copper prices at 23.50c. per lb. for large lots, and 24.67½c. for small lots, effective until June 1, 1918. On this date the prices were re-fixed until August 15; but on July 2 the price was increased to 26c. and 27.35c., respectively, until August 15. On August 7 the current rates were again fixed until November 1, prices to be effective on the day of shipment, not the day of sale.

Quotations in cents per pound are as under:

Date		Average week ending	
Aug.	7	July 2	23.50

SILVER

Below are given official (not Government) quotations, in cents per ounce of silver 999 fine. In order to make prompt settlements with smelters and brokers, producers allow a discount from the Government price of $1, hence the lower price. The Government has not fixed the general market price at $1, but will pay this price (as from April 23, 1918) for all silver purchased by it. The equivalent of dollar silver (1000 fine) in British currency is 46 65 pence per ounce (925 fine), calculated at the current rate of exchange.

The tone of silver in London continues good, but no change has taken place in the price. The Shanghai exchange hardened to 4s. 9d. ($1 14), and it is reported that purchases on account of China have been made in the United States. Indian exports of silver during the financial year 1916-17, according to an official report, showed a substantial increase on private as well as on Government account, mainly owing to larger exports of rupees to Mesopotamia, East Africa, the Bahrein islands, and Ceylon, and of piastres, coined at the Bombay mint, to Egypt. The stock at Shanghai on July 6 consisted of 27,100,000 oz. in sycee and 15,200,000 dollars, compared with about 27,450,000 oz. and 14,700,000 dollars on June 29. The cult of notes of low denominations continues to spread. It is reported from Egypt that the shortage of silver coin in that country, notwithstanding that the circulation has been increased by nearly 200% —namely from £2,500,000 to £7,000,000 nominal value—is impelling an issue of 10-piastre notes. The lowest denomination hitherto has been notes of 25 piastres.

ZINC

Zinc is quoted as spelter, standard Western brands, New York delivery, in cents per pound. On May 25, 1918, the Government fixed prices until September for grade A spelter at 12c. per lb. for itself and the open market. Lower grades can make their own prices as usual. Sheet-zinc is fixed at 15c., and plate at 14c. per pound.

Zinc-ore prices at Joplin, Missouri, are still falling. A month ago second-grade was selling at $51 per ton, but now from $42.50 to $47.40, a large quantity last week realizing $45.

QUICKSILVER

The primary market for quicksilver is San Francisco, California being the largest producer. The price is fixed in the open market, according to quantity. The Government is taking 40% of the United States quicksilver output, paying therefor $105 per flask. Outside of this business the competitive market can make any price as usual. Prices, in dollars per flask of 75 pounds:

Tin-plate in New York is quoted at $7.75 per box of 100 pounds.

Eastern Metal Market

New York, August 7.

A summer quietness pervades all the markets, little interest being shown. The high temperatures of the past few days have interfered with business also.

Copper is marking time awaiting the outcome of the price meeting at Washington today.

Tin is unchanged, and the metal is still scarce.

Lead continues scarce also.

Zinc is still dull, but a little more interest is being shown.

Antimony is inactive and unchanged.

The problem in the steel industry continues to be the production of enough metal to meet the enormous demand for ships and shells. Every effort is being made to meet this demand even at the expense of many other important industries. The problem is a serious one, and will tax the ingenuity of all concerned. Steel mills are now operating at as near full capacity as possible. The War Industries Board is not inclined to favor the selling of pig-iron for 1919, though several large producers have been doing this already, and on a large scale.

COPPER

While demand continues on a large scale, producers have not been inclined to commit themselves far ahead. The whole situation is dominated by the outcome of the meeting at Washington today between the Price-Fixing Committee of the War Industries Board and the producers' representatives. It has all along been argued that an advance of 1½c. per pound on the present 26c. price, established July 2, is decidedly necessary to meet increased costs arising from new freight-rates, labor demand, and many other factors. A price of 27½c. is confidently expected by many as a result of this meeting, while there are some who predict that 26c. will continue. There is still talk of 30c. by January 1, 1919. There is a dispute between consumers and producers: the former maintain that shipments of metal should be made at the contract price, while some or all of the latter claim that all contracts should be adjusted to the present price or the price ruling. The price to be settled upon at today's meeting is the one that is to be effective after August 15, whether it is the same price or a new one. Some expect it to run to January 1, others look for another adjustment between August 15 and the end of the year. Jobbing lots, 5 tons and less are netting at 27.35c. per lb. [Since this was written the price has been re-fixed at 26c. per lb., until November 1.—Editor.]

As indicating how copper exports have fallen off, it may be pointed out that the total for the 11 months ended May 31, 1918, was 769,002,293 lb. of refined metal in ingots, bars, and other forms, against 848,424,583 lb. in the same period of a year ago.

TIN

Trading continues almost at a standstill, and the entire situation is but little changed from that outlined a week ago. Restrictions of all kinds on imports and in shipping are part causes, as well as the new regulations in the Far East, the full effect of which is not yet known. It is a fact that to sell a lot of tin, six different permits are necessary, three in this country and three foreign ones. As a result, the lot of the importer is not an easy one; and these are not all his troubles. In general the market is lifeless. There have been occasional lots of 25 tons offered by the British, and a few sales were made last week for September shipment from the Straits at 84 and 86c. The spot market continues nominal at 94c., New York. For small lots higher prices have been heard of, but they are not significant of the larger market. Arrivals of tin on the Pacific Coast continue to be large. For July there was 6429 tons, one of the largest months on record. Arrivals at Atlantic ports were 740 tons, bringing the total for July to 7169 tons. The quantity in stock and landing on July 31 was 265 tons. The London market has reached its highest figures, spot Straits having been quoted there yesterday at £394 10s., against £385 a week ago.

LEAD

The situation is unchanged, with the scarcity still pronounced. Prices are fixed virtually by agreement of producers at 7.75c. per lb., St. Louis, and 8.05c., New York, but it is almost impossible to obtain any for early delivery. Much higher prices than these have been obtained by dealers and speculators having a few carloads. The jobbing price in small lots is 9c. per lb. for spot delivery. The Government demands for this metal are and have been large, mostly responsible for the scarcity.

Exports have been immense. For the 11 months ended May 31, 1918, the outgo of lead in pigs, bars, etc., has been 196,533,037 lb., compared with 173,226,307 lb. for the same period of 1917, and with 191,230,081 lb. for 1916. Of the 1918 period the United Kingdom took 113,494,170 pounds.

ZINC

There has been little change in this market, which has continued more or less in action at nominal prices of 8 to 8.12½c., St. Louis, or 8.25 to 8.37½c., New York, for prime Western for early delivery. These are bid and asked prices. The tendency in the past few days has been toward firmness because of a slightly larger interest in the market. The quotation by jobbers for small lots in stock is 9.50c. per lb., New York. Grade A zinc has a maximum Government price of 12c. per lb., but has sold under this.

Sheet-zinc is fixed at a maximum price of 15c. per lb., with plate-zinc at 14c. per pound.

ANTIMONY

For this metal, duty paid, 13 to 13.25c., New York, is the quotation with demand light and the market quiet.

ALUMINUM

For No. 1 virgin metal, 98 to 99% pure, and for scrap, Government prices govern this market. For 50-ton and larger lots, 33c. per lb. is the price, while for 15 to 50-ton lots, 33.10c., and for 1 to 15-ton lots, 33.20c. per pound.

ORES

Antimony: There are no developments in the market here.

Ferro-manganese: Imports for June were 5739 tons, the largest of any month this year. The fiscal year's total this year was 33,259 tons, as compared with 73,741 tons for the previous period.

Manganese: Imports of high-grade ore in June were 38,427 tons against 62,778 tons in June 1917. The total for the fiscal year ended June 30, 1918, was 558,018 tons against 656,088 tons for the fiscal year of 1917.

Molybdenite: The market is quiet at unchanged nominal quotations of $1 per pound.

Tungsten: Prices ruling this market are unchanged at $20 to $24 and $24.50 per unit, the higher prices commanded by the purer ores. Demand is good and fairly active market is reported. Ferro-tungsten is unchanged at $2.40 per lb. of contained tungsten, which could perhaps be shaded.

Book Reviews

Concrete Engineers' Handbook. By George A. Hool and Nathan C. Johnson. 867 pp. Ill, index. McGraw-Hill Book Co., Inc., New York. For sale by 'Mining and Scientific Press,' San Francisco. Price, $5.

This is probably the most complete and up-to-date treatise on concrete and reinforced concrete that has appeared, covering both theoretical design and construction practice. While some use is made of the material in Hool's 'Reinforced Concrete Construction,' the scope of the present volume is broader. The first chapter discusses materials for both plain and reinforced concrete. The next two chapters are devoted to methods of construction and to construction plant. Then comes a chapter, which might appear to be out of its logical order, on floors, sidewalks, and pavements. Properties of mortar, plain concrete, and reinforced concrete are then considered. The authors then lead up to the design of buildings through the divisions of beams and slabs, columns, bending and direct stress, and moments in building-frames. Foundations and retaining-walls are then discussed, and then slab and girder bridges, and floors and abutments for steel bridges. The chapter on arches considers also arch bridges. The chapters on hydraulic structures includes under this title, dams, reservoirs, stand-pipes, tanks, and culverts. The two final chapters are devoted to miscellaneous structures and to estimating. Appendixes contain standard specifications for cement, building regulations, and similar data, also a brief discussion of concrete-ship construction. The book is well illustrated and there is a good index.

Elements of Fuel Oil and Steam Engineering: A Practical Treatise Dealing with Fuel Oil for the Central-Station Man, the Power-Plant Operator, the Mechanical Engineer, and the Student. By Robert Sibley and Charles H. Delany. Pp. 320. Index, illustrated. Technical Publishing Co., San Francisco, 1918. For sale by the 'Mining and Scientific Press.' Price, $3.

The treatment of the subject justifies the title of the book. It gives an account of every practical detail of the equipment with which the fuel engineer will have to deal in his daily work. It does not assume familiarity with this equipment, and lead the student into a consideration of the higher principles, and in this respect it will be of extreme value to the student and to the operator who will find it a guide to the things that are assumed as already known by the writers of more advanced text-books. The senior author is now the editor of the 'Journal of Electricty,' and the junior author is a steam-power plant specialist in active practice in the handling of large and complicated operations. The sub-headings treated include the fundamental laws involved in fuel-oil practice, theory of pressures, measurement of temperatures, elementary laws of thermodynamics, steam-tables in fuel-oil practice, computing boiler horse-power, equivalent evaporation and factor of evaporation, the steam calorimeter and its use in fuel-oil practice, rational and empirical formulas for steam constants, the boiler shell and its accessories for steam generation, boiler classification in fuel-oil practice, specifications for purchase of fuel-oil, heating value of oils, taking of boiler-test data, heat-balance and boiler-efficiency, and so on. It is eminently practical.

Quaternary Geology of Southeastern Wisconsin. By W. C. Alden. Professional Paper 106 of U. S. Geological Survey, Washington, 1918. Pp. 356, ill., index.

While this report contains little connected with mining, yet it will be found of interest. The mineral resources are limestone and building materials, iron ore, and peat.

Recent Publications

The following are arranged under the subjects to which they refer:

Coal

Use of Permissible Explosives in the Coal Mines of Illinois. By J. R. Fleming and J. W. Koster. Bulletin 137 of the U. S. Bureau of Mines, Washington, 1917. Pp. 110. Ill., index.

Quick Determination of Incombustible Matter in Coal and Rock-Dust Mixtures in Mines. By A. C. Fieldner, W. A. Selvig, and F. D. Osgood. Technical Paper 144 of U. S. Bureau of Mines, Washington, 1918. Pp. 33. Illustrated.

Effects of Moisture on the Spontaneous Heating of Stored Coal. By S. H. Katz and H. C. Porter. Technical Paper 172 of U. S. Bureau of Mines, Washington, 1917. Pp. 23. Illustrated.

Weights of Various Coals. By S. B. Flagg. Technical Paper 184 of U. S. Bureau of Mines, Washington, 1918. Pp. 11.

Storage of Bituminous Coal. By H. H. Stock. Circular No. 6 of Engineering Experiment Station, University of Illinois, Urbana, 1918. Pp. 187. Illustrated.

Analyses of Canadian Fuels. Part IV, Alberta and Northwest Territories. Compiled by Edgar Stansfield and J. H. H. Nicolls. Bulletin 25 of Dept. of Mines at Ottawa. Pp. 68.

Analyses of Mine and Car Samples of Coal Collected in the Fiscal Years 1913 to 1916. By A. C. Fieldner, H. I. Smith, J. W. Paul, and Samuel Sanford. Bulletin 123 of U. S. Bureau of Mines, Washington, 1918. Pp. 478, ill., index.

Explosives

Initial Priming Substances for High Explosives. By G. B. Taylor and W. C. Cope. Technical Paper 162 of U. S. Bureau of Mines, Washington, 1917. Pp. 24.

Use of the Interferometer in Gas Analysis. By F. M. Seibert and W. C. Harpster. Technical Paper 185 of U. S. Bureau of Mines, Washington, 1918.

Mining

Quarry Accidents in the United States in 1916. Compiled by A. H. Fay. Technical Paper 193 of U. S. Bureau of Mines, Washington, 1918. Pp. 57.

Metal-Mine Accidents in the United States in 1916. Compiled by A. H. Fay. Technical Paper 202 of U. S. Bureau of Mines, Washington, 1918. Pp. 91. Index.

Silicious Dust in Relation to Pulmonary Disease Among Miners in the Joplin District, Missouri. By Edwin Higgins, A. J. Lanza, F. B. Laney, and G. S. Rice. Bulletin 132 of U. S. Bureau of Mines, Washington, 1917. Pp. 116. Ill., index.

Mineral Resources of Alaska, 1916. By A. H. Brooks and others. Bulletin 662 of U. S. Geological Survey, Washington, 1918. Pp. 469, ill., maps, index.

Oil

Bibliography of Petroleum and Allied Substances, 1915. By E. H. Burroughs. Bulletin 149 of U. S. Bureau of Mines, Washington, 1918. Pp. 147. Index.

Recovery of Gasoline from Natural Gas by Compression and Refrigeration. By W. P. Dykema. Bulletin 151, Petroleum Technology 40 of U. S. Bureau of Mines, Washington, 1918. Pp. 123. Ill., index.

Relative Resistance of Various Hardwoods to Injection with Creosote. By C. H. Teesdale. Bulletin 606 of U. S. Department of Agriculture, Washington, 1918. Pp. 36. Illustrated.

Geology

Geology of the Tuapeka District. By P. Marshall. Bulletin 19 of Geological Survey of the Department of Mines of New Zealand, Wellington, 1918. Pp. 79. Ill., index. Some interesting notes on tungsten are to be found in this work.

INFORMATION FURNISHED BY MANUFACTURERS

COMMERCIAL PARAGRAPHS

The Stag Mining Co., Galena, Kansas, is having plans prepared for the erection of a new 200-ton mill. J. L. Hart, Salem, Kansas, is the engineer.

The Rockwood Silicate Works, South Rockwood, Michigan, recently destroyed by fire with loss estimated at $20,000, is planning for the re-building of the plant.

The General Aluminum & Brass Casting Co., St. Aubin street, Detroit, Michigan, has filed plans for the construction of a new one-story, reinforced concrete addition to cost $25,000.

The Union Smelting & Refining Co., Avenue L and St. Charles street, Newark, New Jersey, has taken out a building permit to make improvements in its works to cost about $18,000.

Preliminary plans are being prepared by the **Monsanto Chemical Co.**, St. Louis, Missouri, for the construction of new works in the vicinity of East St. Louis, Illinois, to cost about $750,000.

The Michigan Copper & Brass Co., West Jefferson avenue, Chicago, has commenced the erection of a new one-story building to be used as a rod mill. Westinghouse, Church, Kerr & Co., 37 Wall street, New York, are the engineers.

The Mueller Metals Co., Decatur, Illinois, will build two new mill additions to its works, consisting of a one-story structure, about 85 by 140 ft., and one-story tube-mill, 80 by 280 ft. Plans for the extensions have been completed.

The International Steel Tube & Rolling Mills, Inc., Cleveland, Ohio, is planning for the construction of an addition to its mills at Warren, Ohio, to be used as a steel-tube works and rolling mill. The extension is estimated to cost $500,000.

The Semet Solvay Co., Syracuse, New York, is having plans prepared for a new picric acid works to be erected at Chicago. The proposed plant is estimated to cost about $2,000,000, and will be used for the production of material for the Government.

The Southern Minerals Corporation, Elizabethton, Tennessee, is perfecting plans for the development of property containing bauxite and iron-ore mines, and will be operated in different sections as equipment is put in place. B. D. Harmon is treasurer of the company.

The Gulf Refining Co., Widener building, Philadelphia, has completed plans for the construction of a new refining works at Pittsburgh to cost about $200,000. The plant will be constructed in 10 brick and steel units, to be operated, it is understood, as fast as erected and equipped.

The Arizona Oil Co., Ridgewood, New Jersey, has been incorporated under New Jersey laws with capital of $2,500,000 to operate oil properties in Arizona. Harry W. Forher, Ridgewood; Louis O. Condit, Boonton, New Jersey; and Frederick W. Jackson, New York, are the incorporators.

The Walworth Log, published by the Walworth Manufacturing Co., of Boston, Massachusetts, is an attractive periodical, dealing with the practical applications of the pipe and fittings made by this company. The illustrated article in this issue, No. 6, of volume 5, on ship construction is peculiarly interesting.

The California Molybdenum Co., Inc., New York, has filed articles of incorporation, with a capital of $50,000, to operate mining properties in California. A. M. Barnes Jr., 55 East 76th street, New York, and C. T. Alt, 311 Baltic street, Brooklyn, are the principal incorporators.

The proposed new rod mill of the **Michigan Copper & Brass Co.** will be erected as an extension to the present works of the company at Detroit, Michigan. The final plans call for a structure to cost about $150,000. Westinghouse, Church, Kerr Co., 37 Wall street, New York, is in charge of construction.

The Air Nitrates Corporation, 360 Madison avenue, New York, has completed arrangements with the Government for the construction and operation of a new plant at Elizabethtown, Ohio, to cost about $20,000,000. A site of about 500 acres will be used for the proposed works. The project, it is understood, will be financed by the War Department.

The new coke works of the **Donner Steel Co.**, Buffalo, New York, to be erected for Government service, will cost over $5,000,000. The company has acquired a site of 40 acres on the Buffalo river for the new plant. A department will be provided for the production of toluol for high explosives. The financing of the project will be handled by the Government.

The Acme Motor Truck Co., of Cadillac, Michigan, has found it necessary to increase the size of its plant. This summer a wood-working and body-shop 65 by 80 ft., an addition to the assembly building 65 by 96 ft., a heating and power plant 46 by 80 ft., an office 80 by 118 ft., two washrooms 12 by 30 ft., and a dining room 13 by 46 ft. The boiler room is 46 by 48 ft. with 20 ft. head-room, large enough to accommodate four large horizontal-tube boilers.

About $500,000 will be expended for machinery for the new chemical manufacturing works of the **Bon Air Coal & Iron Corporation**, Nashville, Tennessee, to be located at Lyles, Tennessee. The plant will have an initial capacity of about 40,000 lb. of acetate of lime daily, and approximately 2000 gal. of crude alcohol. The entire works will be used for Government service and is estimated to cost complete about $1,000,000. The George A. Fuller Co., 175 Fifth avenue, New York, is contractor for the buildings.

The Cottrell dry concentrator that was put on the market recently by the **Cottrell Engineering Co.** of Los Angeles, California, will shortly be used at a silver-lead property near Tucson, Arizona. The machine operates on the principle of air flotation, supplementing a high-speed jigging motion. It is simple in construction, economical in operation, and yields a high recovery of the mineral. The company is also manufacturing machines for its own operations at silver-lead, copper, and tungsten properties.

The Steel City Electric Co., of Pittsburgh, makers of electrical specialties, has just published catalogue No. 33,

a handsomely printed and illustrated book of 108 pages, describing and figuring a multitude of articles, including adapters, attachment plugs, automobile junction boxes, all types of boxes, bushings, outlets, clamps, telephone ells and tees, fish-wire, shock absorbers, and others. The company has ceased the publication of bulletins, and issues a complete catalogue instead, of which this supersedes bulletins No. 21 to 30, and No. 32.

The Bastian-Blessing Co., of Chicago, has issued a catalogue dealing with the Rego oxygen-acetylene, and oxygen-hydrogen welding and cutting apparatus. The catalogue is illustrated, and shows complete outfits, with description of the several pieces in each group. A feature of the torches to which special attention is directed is the arrangement for preventing the annoying 'flash-back', or back-firing while cutting. This difficulty is wholly eliminated, and will not occur whether the piece cut is a half inch or six inches, whether dirt or sand is on the metal or not, or even in confined spaces where the head is subjected to considerable heat. The engineer in charge of apparatus for the Bastian-Blessing Co. is Keith Dunham.

Dixon's waterproof graphite grease is composed of high-grade mineral stock to which has been added the proper amount of Dixon's selected flake graphite. The graphite is the vital element, for it imparts to wearing surfaces a remarkable smoothness that relieves the grease of a considerable portion of its task of keeping rough surfaces apart. The flake graphite increases both the efficiency and endurance of the mixture, thus enabling the grease to do heavier duty than would otherwise be possible. Waterproof grease will not stick to wet surfaces. It is, therefore, important that surfaces be dry when the first application is made. On account of its dense sticky nature, waterproof grease should not be used in grease cups. Lubricants of this nature are described in Booklet No. 140-W published by the Joseph Dixon Crucible Company.

Jasper Stone Co. has long been manufacturing grinding-pebbles and tube-mill linings, sold in the market under the trade name 'Adamant Silica.' The term is accurately descriptive. The art of making a substitute for Baltic pebbles has developed under the direction of the Jasper Stone Co. so that a material of equal hardness and resistance, both to blows and to decomposition by chemicals, is regularly produced. In imitating the natural pebbles it follows, as a consequence of making a careful mixture of the ingredients, that perfect homogeneity is attained. This is something that does not exist in the Baltic pebbles, which have been formed by replacement, so that lines of differing composition in the original are reproduced with different texture in the quartz pebble, leading to lack of uniformity in wear. A perfectly homogeneous artificial pebble wears with evenness, and consequently does more effective work up to the last, as shown by more than two years of constant service. These 'Adamant Silica' pebbles are now used for grinding ores, cement, and other substances in 22 States, and in Alaska. Within the past six months the Chino Copper Co. alone has taken 20 carloads of pebbles to be used in grinding its copper ore for concentration. The Utah Copper, the Ray Consolidated, and other of the greatest mining companies are now using the Jasper Stone Co.'s pebbles. The further use of steel balls will be impossible, on account of the Government requisitions for the total iron and steel output in war-uses, and at the same time the shortage of ships and other impediments have made it out of the question to import natural pebbles. The artificial pebble is ready to take the place; having already been proved to be an ideal material for this purpose. The same substance is of the greatest utility as a lining for tube-mills, flotation cells, and other equipment where abrasion occurs; it is also resistant to acids and is adaptable to tanks, vats, launders, and other parts of chemical and metallurgical works where corrosive solutions are employed.

Mine Timbers

How do you cut tenons—
By Hand?

This requires skilled men, high wages, and their result—high mining costs. Once upon a time, not so long ago, mine timber framers were complicated, cumbersome and expensive.

Hand cutting, for the comparatively small mine owner, was a necessity. Not so now. Consider the

DENVER ENGINEERING WORKS CO.

DEWCO
Mine Timber Framer

Made in both the single and double end types.

Simple, efficient, compact, and inexpensive.

Capable of cutting tenons on round or square timbers, and cuts them ABSOLUTELY SQUARE, TRUE and "OUT OF WIND," and does this work about TEN TIMES FASTER THAN SKILLED CARPENTERS CAN.

The accuracy, rapidity with which this machine does the work is a delight to the eye and a satisfaction to your bank balance.

Imperfect ends on a post produce abnormal strains, so that the post will sustain a much less load than when the faces are true and even.

If the bearing of a beam has an irregular surface, the wood fibres will crush much more quickly than when the surface is accurately finished.

Remember, these framers are DEWCO made, your best guarantee of satisfactory service.

There is a framer of a size and type to meet your conditions, large or small. Send for catalogue and prices.

NOTES 239

THE AMERICAN GOLD CONFERENCE 241
The convention at Reno last week was of great importance to gold producers. The Government is asked for relief, but as to what form is left to its discretion. The Eastern banker now sees that with the Western gold miner he can make common cause for aid. M. & S. P., August 24, 1918.

A PROTEST 242
The sale of advertising space in the journals and bulletins of professional engineering societies. A matter of taste, but also of unfairness to the technical press, which performs its functions so well as to be entitled to consideration. The commercialization of professional societies. M. & S. P., August 24, 1918.

AMERICAN GOLD CONFERENCE
By Courtenay De Kalb 243
Results of the recent convention at Reno. Representative gold producers decided that the most effective measure to stimulate the output of this metal was relief to correspond with the increased cost of its extraction, but the amount of gold in the dollar was not to be altered or a premium placed on the metal. M. & S. P., August 24, 1918.

DISCUSSION

JAMES DOUGLAS
By Albert R. Ledoux 245
Further eulogy of the late mining engineer. Douglas was tender-hearted, yet showed anger when fraud was exposed. Brief advice frequently resulted in the successful working of furnaces that had almost frozen, or were about to be given up. The works and sociological departments at Bisbee will remain a monument to his memory. M. & S. P., August 24, 1918.

TO STIMULATE GOLD MINING
By F. W. Carnahan and Frank P. Davis 246
Suggested that a gold administrator be appointed to aid mining of this metal.—Suggested also that the Government erect and operate custom mills as is done in Australia. This would help to develop many prospects. M. & S. P., August 24, 1918.

INTERESTING MINERALS
By W. Tovote 247
These were (1) native gold on native copper; and (2) cuprite replacement of pyrite in diabase. M. & S. P., August 24, 1918.

VITAL MINERALS
By Prospector 247
Another view of the War Minerals Bill. M. & S. P., August 24, 1918.

Page

THE MINER AND THE TARIFF
By W. K. Forest 247
To maintain our 'new' mineral industry, the tariff should be altered to protect such ores against imports from cheap-labor countries. M. & S. P., August 24, 1918.

HYDRAULIC-MINING DEBRIS
By R. T. Hancock 248
Discussion of formula used in the problem of the transportation of debris by running water. M. & S. P., August 24, 1918.

THE STATUS OF GOLD MINING
By Albert Burch 248
The California Metal Producers Association now considers that some form of direct financial aid will improve the gold situation. M. & S. P., August 24, 1918.

ARTICLES

A NEW BONUS PLAN
By A. M. Heckman 249
Details of the bonus system recently started by the Phelps Dodge Corporation in Arizona. Under easy conditions a liberal bonus is given for continuous work, irrespective of the wage-rate. M. & S. P., August 24, 1918.

EFFECT OF OXYGEN IN PRECIPITATING GOLD FROM CYANIDE SOLUTIONS
By Thomas B. Crowe 251
In zinc-dust precipitation, air is excluded from contact with the precipitant and the precipitate. Oxygen is a deterrent to good zinc-box work. M. & S. P., August 24, 1918.

BRIDGES AND ROADS IN MINING DISTRICTS 252
Practical notes, illustrated, showing how to construct a cheap and strong bridge across a river. M. & S. P., August 24, 1918.

A LETTER FROM THE FRONT 254
One of the best letters that we have read, being events spread over three days on the front. M. & S. P., August 24, 1918.

A FLOWING DUMP 258
Disintegration of schist causes a dump to slide. M. & S. P., August 24, 1918.

Established May 24, 1860, as The Scientific Press; name changed October 20 of the same year to Mining and Scientific Press.

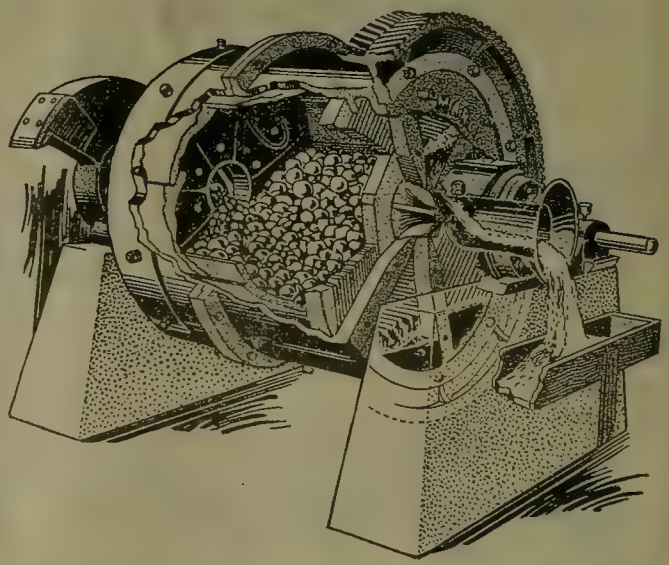
Entered at the San Francisco post-office as second-class matter. Cable address: Pertusola.

Branch Offices—Chicago, 600 Fisher Bdg.; New York, 3514 Woolworth Bdg.; London, 724 Salisbury House, E.C.

Price, 15 cents per copy. Annual subscription, payable in advance: United States and Mexico, $4; Canada, $5; other countries in postal union, 25s. or $6.

Just—"One Easy Step"

The Marcy Ball Mill in conjunction with a screen or classifier will reduce a primary crusher feed to practically any required fineness in "One Easy Step." The extreme efficiency of this method—its low cost, economy of time, floor space and labor—is responsible for a substantial part of the dividends of many mining companies.



MARCY BALL MILL

The mill is charged with many sizes of balls. Then coarse feed enters and there is soon a revolving mass in which the ore fills the voids between the balls. The mass is heavy, flexible, compact; permitting maximum abrasion and crushing.

But one-fourth to one-third of the Marcy Mill is filled by the pulp; this low pulp line increases the crushing effect of the balls.

Balls, liners and ore become covered with sand—causing abrasion wherever there is a moving contact.

The capacity of any mill is measured by its ability to discharge the crushed product when it has attained the desired fineness.

Note these points:

The Marcy Ball Mill discharges **near its periphery.**

Radial lifters afterward bring this discharge to the discharge trunnion as illustrated in the diagram. Through this **unobstructed discharge** the crushed product passes out.

Since Marcy Mills carry a small amount of pulp, a rapid circulation can be kept up and more work be done.

In many plants, Marcy Ball Mills are proving the value of "One Easy Step" crushing system.

Suitable manholes are provided, so that it is unnecessary to remove a Marcy Mill from its bearings in relining.

New York Office: 42 Broadway

WE are glad to be able to state that the U. S. Bureau of Mines has appointed Messrs. H. Foster Bain, Charles W. Merrill, and J. Edward Spurr a committee to prepare a plan for organizing an industrial mining reserve in connection with the new draft law. This means an intelligent effort on the part of the Government toward the compulsory exemption from military service of such men as are necessary for the maintenance of metal production.

ON the whole we prefer the dentist to the ambassador as a retailer of gossip concerning the court of the All-Highest. Dr. Davis is more interesting than Judge Gerard, particularly when he gives us the Kaiser's opinion of Hearst and his hired scribes. W. R. Hearst should be proud of the Over-Lord's statement, according to the dentist, that "Mr. Hearst has helped our cause very much in your country." Again the same commentator on great events is reported, by his dentist, to have said: "Mr. Hearst is the only one, so far as I could find, who has revealed the real conditions and told the truth about them." This is "a gift" from the Kaiser to the champion exponent of yellow journalism.

RUMOR states that Mr. Bernard M. Baruch is reaching out for the War Minerals administration in case it is organized under the bill now before Congress. This would take it from the Department of the Interior, with which Secretary Lane is identified. We hope that nothing of the kind will happen, for if a War Minerals administration is established we would be sorry to see it pass under the hands of a speculative financier like Mr. Baruch. The steel and copper people are trying to kill the War Minerals bill and if the attempt to legislate ends in a mere Federal corporation, to buy secondary minerals, they will have succeeded. The mining industry calls for something more than that, some means to ensure the eventual amortization of the capital going into the production of war minerals.

ANNOUNCEMENT is made that the corporate name of the Selby Smelting & Lead Co. has been discontinued, the plant to be known hereafter as the Selby Smelting Works, but the business will be conducted under the same management as heretofore in the name of the American Smelters Securities Co., which corporation Chester A. Thomas, formerly manager for the Yukon Gold Co. at Dawson, as manager. Mr. H. B. Underhill, Jr., as financial agent, perpetuates an association that dates from 1876. The Selby smelter is an important industrial asset to San Francisco.

RETAIL prices of food in the United States have increased 66% since June 1913, according to the Department of Labor. This will induce further homage to that tyrannical factor now initialed as H. C. L.; but the cost of living is neither the retail price of food nor the average of many staples as given in the index number of the statistician, such as 'The Statist' or 'The Annalist'. The expenses of living in a civilized country include many items ignored by the authorities mentioned, such as rent, water, gas, light, clothing, domestic service, and other things necessary to an average scheme of existence. We still believe that 40% is a fair approximation to the increase in the expense of the ordinary citizen since the Germans mistook Belgium for a road to Paris.

LAST WEEK the engineers of San Francisco had a pleasant opportunity of meeting and hearing Mr. James F. Callbreath, the permanent Secretary of the American Mining Congress. He had come from the Gold Conference at Reno, so he was invited to give an address before the Engineers' Club on the status of gold, the taxation of mines, and the War Minerals Bill. Among other things he stated that the Bill had provoked such opposition before the Senate Committee on Mines as to cause Senator Henderson to draft a new bill creating a War Minerals Corporation, with a capital of $50,000,000, to be used for buying and stimulating the production of the secondary minerals, and that it was hoped the House would pass this new bill, although the lower legislative chamber might take umbrage at the radical change made in the Bill as originally drafted. Mr. Callbreath was asked to say something concerning the organizing of a local chapter of the American Mining Congress, a matter that has been taken in hand by the California Metal Producers Association and other representative groups. He outlined the work he and his associates were doing and asserted that he was not ashamed to say that the Mining Congress was "devoted to mining politics," for an interest in politics was part of the duty of every intelligent citizen. The representatives of the Mining Con-

tion has assumed all assets and liabilities. We are glad that a famous old name has been retained, notwithstanding the change of status. Mr. Eugene B. Braden continues to be general manager of the smelter, with Mr. gress endeavored to keep watch at Washington so as to save the mining industry from ill-advised legislation. The miner, and those dependent upon him industrially, need such protection at headquarters, for there was a vast amount of ignorance to overcome among the lawmakers. A resolution was passed supporting the American Mining Congress and appointing a committee, headed by Mr. Albert Burch, to take steps for the formation of a State chapter. We take pleasure in recording this fact and hope that it will have the effect of bringing the mining men of California to the organized support of the American Mining Congress.

EXTENSION of the draft downward to those 18 years old and upward to those 45 years old has the immediate result of placing the entire effective manhood of the country under military requisition. It does not mean that all men between 18 and 45 years of age must serve in the Army or Navy, but it does enable the Government to ensure that all either 'work or fight'. One consequence is that the unemployed, whether rich or poor, are compelled to do something that is useful for the great purpose in hand. Mr. Gompers and other leaders of the labor-unions appreciate, of course, that this enactment places an embargo on strikes, compelling any recalcitrant workers to submit their grievances to arbitration under penalty of being drafted as soon as they indicate the intention to abstain from productive work. If the law is applied fairly, as we feel confident it will be, so as to compel the unemployed of every class, including the flaneurs and sportsmen of the richer element in the community, to 'work or fight', we see nothing but good in the result. The sooner the whole country is mobilized to defeat the Prussian purpose and restore international law, the better for all, rich and poor alike.

GENERAL MARCH, Chief of Staff, spoke with remarkable frankness to the Senate Committee on Military Affairs. It is a sign of the times that such forthright speaking is appreciated not only at Washington but throughout the United States. "The policy of the War Department," he said "is to put the maximum number of men in France with the idea of shortening the War." We have 1,500,000 there now; we are to have 80 divisions of 40,000 each, or 3,200,000 men, in France by June 30 of next year. The military energies of this country are "to be centered on the Western front from this time on," so as to break the Enemy decisively where he will feel it most. "The only way that Germany can be whipped is by America going into this thing with her whole strength." The country is fully prepared to back up this policy with all its resources in men and material. The General added: "We are going to win this War if it takes every man in the United States." It is well that our Allies and the Neutrals also should understand that nothing less than this is our firm intention; the Enemy is learning to appreciate the fact already; he is being as much disheartened by the intensity with which the American is going into the fight as our Allies are being cheered by the vigorous aid we are giving them. We are in it to a finish; the world is beginning to understand that we intend that the War shall not drag its tale of horror and misery across many more years.

ON another page we publish an account of the Gold Conference at Reno by Mr. De Kalb, who took a useful part in the proceedings. From letters received we are aware that the gold-mining fraternity is alive to the compelling seriousness of the crisis and is glad to see so much publicity given to the subject. In London the financial community has awakened to the fact that not only is gold mining threatened but that the industrial security of the Allies is menaced by the decreasing production of gold. Recent monthly statistics show that in West Africa, Rhodesia, and Australia, as in the United States, the output of the standard metal is declining alarmingly. As our friend Mr. F. H. Hamilton says, in a letter to the 'Financial Times,' "after the War Germany must purchase her raw material either for manufactures or for gold. The former she will not possess, and if she depletes her stock of the latter, presuming the gold standard to be maintained in other industrial countries, the basis upon which her currency rests will be so weakened as to depress her credit and hamper her international commercial activities for a long time to come." In short, the fact that the Allies control 92 to 95% of the gold production of the world is an economic weapon of the greatest value; to an unusual degree gold has become the sinews of war; not only is it the basis of a towering structure of credit but it is destined to be the controller of international trade with the Enemy when he has been brought to account. Is the production of gold a source of strength to the cause of the Allies? If it is, shall we allow it to be stricken for lack of proper measures of support?

HOW securities have met the shock of the world war is shown by a tabulation of representative stocks appearing in 'The Annalist,' comparing the closing prices on the eve of war, July 30, 1914, with the prices quoted on July 31, 1918. We give a few of the figures.

Companies	July 30, 1914	July 31, 1918
20 railroads	87.43	78.53
10 public utilities	92.31	72.37
7 steel, iron, and coal	27.91	78.92
10 copper, lead, and smelting	31.06	48.37
5 metal manufacturing	54.20	66.97
4 oil	56.28	84.81
7 food and food products	52.80	72.23

It will be seen how the metal-producing and manufacturing companies have prospered, but the figures do not cover the high prices of the boom period two years ago when the top quotations for the group third on the above list averaged 182.12, the fourth 76.83, and the fifth 101.42, while the first and second reached a high mark of 111.07 and 117.51 respectively. After the declaration

of war by the United States there was a period of liquidation lasting to nearly the end of December 1917, but since then the market has been surprisingly strong, even in the face of the bad news that came to hand during the German offensives in March and April. As yet the complementary effect of the good news of the Allied counter-offensives has not made itself felt on the Stock Exchange, which, it must be conceded, has shown a fine spirit of sane optimism throughout the War.

THE latest Institute bulletin contains a great deal of interesting matter, the compilation of which suggests the work of a competent editor. It is a pity, however, to give the remarks verbatim of everybody that rises to speak at a dinner; for instance, in the account of the dinner at Washington, an interesting and thoughtful speech by Mr. Hoover and an elaborate statement by Mr. Pope Yeatman are mixed with sundry observations by others whose engaging presence is required to save them from seeming ridiculous. The Women's Auxiliary, which is endeavoring to Americanize the mining industry, makes a report of its work through Mrs. C. C. Burger, the chairman of a special committee organized for this purpose. The work being done by the wives of members in furthering Americanization should receive enthusiastic support, for it is of the greatest value to the Nation. A list of those 'Died in Service' has been started; as yet it includes only 11 names, but it is destined, we fear, to fill several pages before the end of the War. 'News from Members at the Front' is an interesting departure and should grow in scope as our representatives in Europe realize how eager we all are to hear from them. The list of 'Members of the Institute in Military Service' suffers by the inclusion of non-military gentlemen, such as one who is "stimulating the production of chrome ore" in California, members of the Food Administration, and others engaged in purely civil work. Discrimination is needed in preparing these lists of honor, otherwise they lose their value. Ten pages are given to 'War Activities of the Engineers'; this furnishes much timely and necessary information for those willing and able to take part in various branches of useful activity, including research, submarine, and military service. Sir Robert Hadfield, the famous metallurgist and steel manufacturer, contributes a delightful note on 'British and American Friendship', in the course of which he dwells upon the welding of the English-speaking peoples as a direct consequence of the War. To this he adds a comprehensive statement describing the various steps being taken at present in Germany to develop and encourage scientific research and to prepare for the rehabilitation of trade after the War; he also gives a translation of a recent account of the present conditions of mining and metallurgical industries in Germany. All of which is valuable information. Finally, this compilation of interesting information concludes, most appropriately, with an appeal to members of the Institute as intelligent men to attend to their civic duty at the polls in the forthcoming Congressional elections.

The American Gold Conference

When Governor Emmet D. Boyle called a conference of gold miners to meet at Reno it is fair to say that the usefulness of the meeting was doubted. This skepticism was expressed in the East more than in the West. The outcome, however, has been a presentation of the hardships of the gold-producer, coupled with an appreciation of the needs of the financial world, that will command the respectful attention of the country. It is merely to state a historic fact that the East instinctively distrusts the West whenever it deals with the fundamentals of national finance. It was in Kansas that the greenback heresy was longest advocated; the division on the question of bi-metallism was almost along sectional lines, so preponderant was the Western demand for free silver. The case of the gold miner, struggling today against costs, which, like the enveloping mistletoe, are eating out the heart of the oak from which alone the structure of national credit can safely be built, was prejudiced in advance by arguments for raising the 'price' of gold. Adverse criticism of the meeting developed promptly, but the representatives of the gold-mining industry who assembled at Reno have done a notable thing: they have declared in unequivocal terms for sound money. They petition the Government for relief; they leave it to the discretion of the authorities at Washington to determine the kind and measure of that relief; but they declare in their resolutions, which voice the opinion of the Conference, that "nothing contained in these resolutions is to be construed as meaning an intention to alter the amount of gold in the dollar, nor to place a premium upon gold." It must bring satisfaction to the bankers and financiers, who are struggling to carry our credit ship on an even keel through the troubled waters, to receive such a pledge of allegiance to the principles of sound money from a convention of gold miners assembled in Nevada. This should win the instant support of the East to the request of the gold-producers for assistance. It now becomes evident that the Eastern banker and the Western gold miner can make common cause, for the banker is as deeply interested in maintaining an unbroken stream of gold from the mines of the West to the Treasury at Washington as are the owners of the mines themselves. Incidentally, who are the owners of the gold mines? Through the distribution of stock they are mainly capitalists in the East. The producers then consist of these, of the staffs in charge of operations, and of the laborers who perform the work of mining the ore and extracting the bullion. Gold mining, as an operation, is Western, but as an enterprise it is national. In view of its fundamental position in providing the basis of exchange, without which we must presently witness a wasting gold-reserve while the stream of fresh supply is cut off, it would seem logical that the American Bankers Association, at its session in Chicago next month, should endorse the petition of the American Gold Conference for relief, and co-operate in securing prompt action to accomplish it. The stress has become so great, from the increased

cost of supplies and labor, and the diminishing ranks of the miners who are attracted by the higher wages offered at shipyards and in other favored industries, that governmental action may not long be deferred if the more important gold properties are to be saved from closure.

The conference at Reno has developed into a national organization, with active committee-men in twelve States. The personnel of the executive committee, given on another page of this issue, will inspire confidence both East and West; it consists of men with a national reputation for executive as well as technical ability. The Conference has not tied their hands by insistence upon details of policy; it has, however, closed the door against any change in our monetary standard, which strengthens the position of the committee with the sound business men of the country, whom they must win to their side. It would appear that the remedy for the depression in the gold industry will be sought in preferential treatment, if that be found sufficient, and, if not, in the payment by the Government of a direct royalty on the new gold produced. The recognition of the service performed in strengthening our gold reserve through the payment of a royalty would appear to be the simplest means, and this is likely to be seriously considered. If the amount be sufficient to sustain the mines that are operating nearest to the economic limit, those needing less assistance would part with the excess automatically under the forthcoming tax-law, which thus would serve the function of an equalizer. In some manner relief must be given without delay if the production of gold in the United States is to be saved from inevitable collapse. We publish more letters on the subject and expect our readers to help us in awakening the public to the seriousness of the crisis.

A Protest

Technical Societies, besides performing their normal function as purveyors of information useful to the profession, are engaging in commercial publishing, that is, they solicit advertising for revenue. For instance, the August issue of 'The Journal of the American Society of Mechanical Engineers' differs but little in appearance from any one of a dozen trade papers, even the size of the pages showing a radical departure from the standard adopted by the bulletins of the technical societies. There are two reasons for objecting to the commercialization of professional organizations such as the American Society of Mechanical Engineers and others that we need not mention. One is a matter of taste, concerning which we know it to be proverbially useless to dispute. There is no accounting for taste, or the want of it. The second is expressed by the proverb *ne sutor ultra crepidam*. It seems a pity for engineering societies to trespass upon the domain of the engineering papers; it appears undesirable for the one to try to do what the other is doing so well. If the technical press were inefficient, if it were deteriorating so obviously as to call for a corrective or a substitute, then there would be some reason for the invasion of the journalistic field by the professional organizations. No such reason exists. Technical journalism of the kind that is based upon commercial publishing has improved greatly during the last two decades, so that no excuse, except the making of money, exists for the trespass of the professional societies into a field outside their proper scope. There are other reasons, not so easy to state politely. When an engineering firm or a manufacturing company headed by engineers is asked to advertise in the professional society's periodical—a journal or a bulletin—it is intimated that such advertising should be given in order to support the society, otherwise the firm or company will "get in wrong with" the directors of the society. This is gentle blackmail, of course. A trade paper that tried any such method would soon be made to feel sorry for it; no solicitation for business is tolerated by its clients except the undertaking to give adequate publicity in exchange for the money paid according to contract. One hears warnings against the commercializing of the profession, but does it occur to those who are so eager to commercialize the reputation of a professional society by using its bulletins for advertisements that they are setting the worst possible example? An engineer pays $15 per annum in dues in order to obtain the privilege of being a member of a professional society and of obtaining a mass of poorly edited reading-matter; he can obtain as much as he can read, better prepared, for a third the cost by subscribing to a first-class technical paper, of which there are enough in number and in variety to suit everybody. We recall the attempt made several years ago by the owner of the 'Pacific Miner', in San Francisco, to mobilize his readers into a technical society at the price of the annual subscription, which was modest. In return for the subscription his readers received the valuable information purveyed weekly (and weakly) by the 'Pacific Miner' and with it the right to attach R. S. V. P. or P. D. Q. after their names! This was about as logical as some of the efforts being made by the controllers of sundry professional societies at their headquarters, mostly in New York. It is about time for these associations to determine what purpose they have in view and what work they expect to perform for the profession and for the country. We see no reason why the technical press should submit tamely to an increasing invasion of its territory, within which it is doing honest service for the profession. Encouragement for this protest is to be found in the policy followed by the strongest of the engineering organizations. In these, as in other matters, the American Society of Civil Engineers sets a good example; so does the Institution of Mining and Metallurgy, in London. Both these societies have refused to solicit advertising for the very reasons we have stated. We hope that the members of the engineering profession generally will take an interest in the question and make their influence felt at headquarters. The society that commercializes its activities loses its character, and, we are frank to say, rarely delivers a journalistic product sufficiently good to excuse the departure from honorable precedent. Let the shoemaker stick to his last.

American Gold Conference

By COURTENAY DE KALB

Four notable things were brought out at the meeting of the leading gold-producers of America, who assembled at Reno, Nevada, on August 12, 13, and 14, in response to a call issued by the Governor, Mr. Emmet D. Boyle. These things were a unanimity of opinion that gold mining will almost wholly cease unless Government assistance be extended at an early date; that the gold miners, as the producers of the monetary metal, are opposed to any change in the existing standard on which our currency and credits are based; that the Government has definitely placed gold mining on the list of preferred industries as an essential for war-finance; and that the workingmen appreciate their relation to the industry as partners in the production of gold. The attitude of the delegates to the Conference is expressed in the following resolution:

WHEREAS, gold production in the United States has declined from $101,000,000 in 1915, to $84,000,000 in 1917, with a still greater decrease now taking place, the production of California alone having declined $3,000,000 in the first six months of the present year; and

WHEREAS, this decrease is principally due to the increased cost and shortage of labor and material, the price of gold, as our standard of value, being fixed by law at the invariable figure of $20.6718 per ounce, thus being the only important product which has not obtained an increased market price due to the present war conditions; and

WHEREAS, under present conditions capital cannot be obtained for gold mining, but is generally being withdrawn wherever possible from the said industry; and

WHEREAS, on account of the increased cost of production with no increase at all in the market price of their product, many mines have been forced to cease operations in the last six months, many others are now running at a loss, and are about to be closed down or abandoned, and from their nature will require years to be re-opened, so that a large portion of the gold mining industry is now threatened with extinction; and

WHEREAS, a war emergency exists, which we are advised by our Government necessitates the maintenance, and, if possible, the increase of gold production in the United States, as of next importance after food and war munitions, being of vital importance as a basis for our continually expanding credits, which are necessary both for the financing of the war and for reconstruction after the war; and

WHEREAS, the gold resources of the United States are adequate to maintain our former production, and to afford under proper encouragement a substantially increased production; now therefore be it

RESOLVED, that it is the sense of this meeting that of all the various measures which have been suggested, the following will be the most effective in maintaining and encouraging the production of gold in the United States, namely, relief by the United States to the gold producers of this country to correspond with the increased cost of production, the extent of such relief to be fixed from time to time to meet changing conditions; but nothing contained in these resolutions, as passed, is to be construed as meaning an intention to alter the amount of gold in the dollar, nor to place a premium upon gold.

The emphasis laid upon the maintenance of sound money, as seen in the last paragraph, will meet with the appreciation of bankers and financiers, and will accord with the desires of Secretary McAdoo to foster the production of gold for the purpose of broadening the foundations of national finance.

All doubt as to the exact position of gold in the priority classification was removed by a telegram from Edwin B. Parker, Priorities Commissioner, in answer to a request from the Conference for a statement on that point. His reply was: "The following resolution was adopted by the Priorities Board. Be it resolved by the Priorities Board that gold mining is an essential war industry, and the powers of this Board be so exercised as to accord to such industry preferential treatment in the supply, not only of tools, machinery, and equipment, but in the transportation service, fuel, and labor-supply." This means that, so far as labor is concerned, the employees at gold mines will be in the deferred classes under the draft, and will not be subject to call except in the event of a serious need, which is not likely to arise. The endorsement of the aims of the Gold Conference by Labor was contained in a telegram from Charles H. Moyer of the International Mine, Mill, and Smelters Union, as follows:

I am instructed to inform your convention that the International Union of Mine, Mill, and Smelter Workers are in full accord with the efforts of the gold producers to stimulate the production of gold and to offer the cooperation of our International to that end. It is also the sense of our organization that on account of the rapidly increasing cost of living the question of wages must necessarily be considered jointly with the cost of production, may I suggest that in our opinion the best interests of our nation, the producers, and labor can be conserved through our joint action in this important matter.

It is evident that the movement for aiding the gold miners has been crystallized under conditions that should ensure public favor. With the expectation of being able to co-operate with the mining associations of the several States, and recognizing that the leading gold mines of the country were represented at the meeting, a permanent organization was effected under the national title of the American Gold Conference. For the present the general office of the association will be in the Reno National Bank building, at Reno, Nevada, with Henry M. Rives as secretary. For the purposes of expanding the organization, so as to have direct representation of the several gold-producing States in its active propaganda, a general committee was appointed consisting of Albert Burch,

California, B. L. Thane, Alaska, H. N. Lawrie, Oregon, Bulkeley Wells, Colorado, J. A. Burgess, Arizona, George T. McGee, Montana, Imer Pett, Utah, Robert N. Bell, Idaho, E. H. Clark, South Dakota, J. G. Kirchen, Nevada, and Milner Roberts, Washington.

For the more energetic work of bringing the facts regarding gold mining to the attention of the authorities in Washington an executive committee was constituted as follows: Emmet D. Boyle, Carson, Nevada, W. J. Loring, San Francisco, California, Bulkeley Wells, Denver, Colorado, Whitman Symmes, Virginia City, Nevada, and George W. Starr, Grass Valley, California. Other permanent committees were: Finance, Eugene Davis, G. W. Starr, and G. M. Taylor; Publicity, John G. Barker, Eugene Davis, and Courtenay De Kalb.

The first essentials are to add to the organization all the producers of gold in the country, and to collect full statistics from all operators concerning costs, tonnages mined and treated, recovery, supplies consumed, and the number of employees, together with the wages paid, as well as ore-reserves and their assay-value, maximum capacity of mine and mill, and a statement of the increase in output that could be made by additional equipment. Such data should be submitted to the Secretary, or to any member of either the general or the executive committee.

The sessions of the Conference lasted three days, and from first to last 96 delegates registered. These represented 11 States, and included managers and owners of the majority of the large gold mines of the West. In addition to the routine business, a general discussion of the status of gold mining and the relation of the domestic gold production to national finance illuminated the proceedings. J. F. Callbreath, secretary of the American Mining Congress, pointed out the importance of sustaining the industry, in order that our national credit might not be weakened. Unless there is an increase in the security on which our governmental obligations are based, financial difficulties must follow. The effort now being made to secure the co-operation of the Government in maintaining the industry of gold mining is as important to the bankers and financiers of the East as to the miners themselves. There was no augmentation of output even in the pre-war period, when the relation between the costs and the gold recovered was favorable. This makes it more easy to comprehend the extraordinary decline of the industry. He was confident that the officials at Washington were fully aware of the gravity of the crisis, and that they would lend ready assistance to the movement. Carl C. Plehn, Professor of Economics in the University of California, presented an analysis of the function of gold as the basis of currency and national credit, and showed how important were the seemingly small additions to our gold reserve derived from our annual output. The great stock of gold in the Treasury is the foundation of our credit, but as the obligations increase it is these marginal additions that relieve the strain and prevent the rupture of confidence, just as a small marginal addition to the strength of steel will enable it to carry its load with safety. The rise in prices has not been the result of a suspension of specie payment, since, in effect, there has been no such suspension. The phenomenon has been due to the natural increase of prices due to the suddenly enlarged demand, or, to look at it from another viewpoint, it is because of the rapid spending. A large demand over a moderately long period makes a firm strong market, but does not raise the cost of supplies as does the same demand concentrated in a brief period; there is a time factor in market quotations, as well as a mere quantity factor. The high prices caused by the War must not be confused with the quantity of gold in the vaults, but the expansion of this reserve is essential to strengthen the foundation of credits. Governor Boyle recalled Lloyd George's assertion that gold is the "third line of defense," and impressed upon the Conference the need of presenting a case to Washington that should be sustained by ample statistics to prove the contention that gold mining would dwindle to insignificance without Federal aid, and that the request should be definite, and economically sound, practical, and fair. Important contributions to the discussion were given by John Clausen, vice-president of the Crocker National Bank, San Francisco, G. McM. Ross, Whitman Symmes, C. E. Lewis, William H. H. Hart, John A. Fulton, W. J. Loring, Bulkeley Wells, and others. The party visited the Comstock mines at Virginia City, and the courtesy of a dinner at Carson City was extended by the Nevada Mine Operators Association.

In the Brinell ball-test for hardness, a hardened-steel sphere 1 cm. diameter is pressed into the surface of the material. Brinell's hardness number is the quotient of the pressure (3000 kg. for hard metals and 500 kg. for soft metals) and the area of the surface of indentation. It is expressed in the equation $N = P/2\pi tR'$, where $N =$ hardness number, $P =$ pressure, $t =$ depth of impression, and $R' =$ radius of curvature of indentation. Since the relation between the load P and the depth of impression t is constant for any one metal, Martens suggests the ratio of P/t as a measure of hardness, and the hardness number as the load P in kilogrammes necessary to indent the material an amount t equal to 0.05 mm. Devries gives the following values for the hardness-numbers of metals:

	$\frac{P}{2\pi tR'}$	$\frac{P}{t}$
High-carbon steel	641.0	4550
Manganese steel	179.0	641
Cast-iron	149.0	538
Bessemer steel	188.0	428
Tool steel	289.0	1230
Copper	89.5	235

A fairly close relation exists between the hardness-number and the ultimate tensile strength of metals. Thus, Devries gives the results for alloy-steels as follows: tensile strength, S_M (lb. per sq. in.) $= 20{,}000 +$ hardness-number times 103), in which the hardness-number is the load P (in kg.) required to indent the material to a depth of 0.1 millimetre.

James Douglas

The Editor:

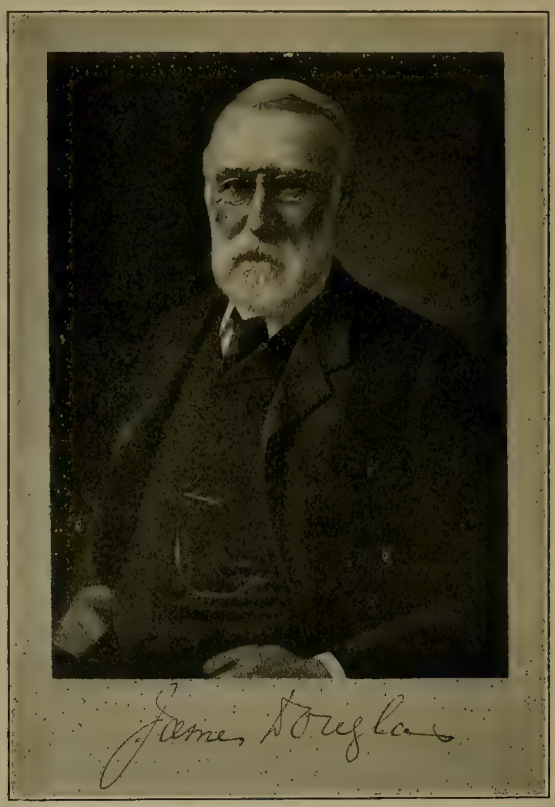
Sir—You ask me to send you some word about my dear friend, the late James Douglas. Absence in Canada and other things have prevented my earlier compliance. Now I must come after those who eloquently and justly have contributed, editorially and otherwise, to the growing volume of appreciation, and have compiled the long list of his achievements, and publications, and of the distinguished honors heaped upon him. Even the lists of his many and generous benefactions have appeared, though while he lived no one knew the tale of his private charities, or the number of the men to whom his advice—his willingness to put himself out for them—have meant success or at least encouragement and inspiration.

In writing of James Douglas, the man, one cannot yet lift the veil that covered to most the entrance to the sacred precincts of his home life. Thoughtful, considerate, affectionate, he was an ideal father and husband. Outside, he was not a man who wore his heart upon his sleeve. But in the intimacies of long journeys, over plains and mountains, in the hours by a fireside in some mining camp, one came to know him and to marvel at him. At other times, the strains of some great music, even the song of some woodland bird, or some stupendous vision at sunset, would move him until he would reveal the tenderness and great-heartedness of his poet's soul.

I have doubtless told previously some instances of his tenderness for the little brothers of the wood and field. He loved all Nature; was an enthusiastic fisherman, a very centaur on horseback, a hunter who killed his first moose at the age of ten; and yet he was as tender as a woman to his faithful dog and would not harm a fly.

One day he was examining some outcrops which had been prospected. In the bottom was a pool of shallow water, and in it a half-dozen toads which evidently had been trapped in their adventure across the country. "Oh dear, Ledoux," he cried, "what shall we do? We cannot leave them there; they will starve to death!" No ladder was available. He searched the bank until he found a fallen tree of suitable length, and we dropped the end into the pit. Down he went, and then began a strenuous chase for the agile captives. Not until he had caught them all and tossed them up for me to remove to a distance did he clamber out, muddy and hot, but happy. I have seen James Douglas in times of stress, for I knew him in the days of Phoenixville. I have seen him in action when deciding some great problem, and have seen the fire of his anger and the withering scorn with which he met some evidence of fraud or trickiness in professional or business competition. But I like best to remember his face as he rested in an old sedge-grass field after rescuing those toads.

I have told and could multiply instances of his generous giving from his store of acquired wisdom, when help was needed. Again, I will repeat: Many years ago I was sent to report upon a process employed by a



smelter in Wales. Douglas was in London and offered to go along. After we had seen that portion of the plant which was of especial interest to us, and which the proprietors were obliged to let me see, we were hurried through a part of the rest of it, and saw a small converter over which the superintendent and his men were perspiring. It was almost, if not quite, frozen up. Douglas stopped, much to the disgust of our committee of guides, and asked what was the trouble. Reluctantly, they told him that they were experimenting in bessemerizing some copper matte with the view of substituting that method for treatment in reverberatories. He looked

the thing over and asked the pressure of the blast. They said "Four ounces." "Four ounces!" said Douglas, "No wonder it froze on you! Run it up to four pounds." We went on, leaving the superintendent muttering: "If she freezes with four ounces of air, she'll go solid at once with four pounds." But apparently he tried it, for when we reached our hotel in London, he found a telegram from Swansea saying: "Converter working beautifully. Many thanks for your advice." Somewhere among Dr. Douglas' papers is perhaps still to be found the resolution which the directors of the company passed, officially thanking him for the great assistance he had given them. Doubtless this was only one of many similar experiences. I can recall the statement of the former superintendent of a Colorado smelter that a casual suggestion of Dr. Douglas enabled him to put a silver-lead-zinc mixture through his cupola, which previously was considered impracticable, if the values were to be saved.

Dr. Douglas disclaimed any knowledge that would cause him to be considered a 'specialist.' In fact he once wrote me:

"I made my reputation as a mining engineer and metallurgist in spite of the fact that the only scientific lectures I ever attended were in a course on chemistry when I was studying medicine. I think that the lesson of my success, such as it has been, demonstrates that great enterprises are often best controlled by managers who have a general, wide, technical knowledge, *but are not specialists,* and who have had the advantage of sound literary educational training. The effect of specializing of any kind is to contract a man's outlook, though it may make a good student of him."

He was a broadly educated man, a musician—a dreamer if you will; but his visions became realities, his dreams came true. They were materialized in the adaptation or invention of processes and bore fruit in generous human treatment of men. They are perpetuated in the monument we call the 'Copper Queen.' His ideals there survive and under the guidance of associates, and successors trained in his school, James Douglas will never need a shaft upon the slope of Mount Herman, Quebec, to perpetuate his memory. Standing on the hill of Bisbee, or upon the plain at Douglas, and noting not only the buildings containing the great plants, the yards, the busy tracks, but the libraries, hospitals, schools, and Y. M. C. A. halls, one may well repeat what was said of another great man: *"Si monumentum requiris, circumspice."*

ALBERT R. LEDOUX.

New York, July 29.

To Stimulate Gold Mining

The Editor:

Sir—Now that the Allies' offensive appears to be well in hand I wish in all seriousness to make the suggestion that some good dollar-a-year man like Herbert Hoover or Charles Merrill be requested to produce such gold as the United States and our Allies may require. There should be an adequate salary attached to the position. I was struck while wandering around corridors last week in Washington with the large number of mining men in war work—all kinds of bureaus and metals except gold. The readiness of the public and general appreciation of the situation is abundantly proved by the movement in Alaska Gold stock. It is a certainty that with one half the Government backing that has been freely and wisely accorded the Food Administration, war savings, enlistments, etc., the gold output of the U. S. can be trebled within 20 to 24 months by the single method of more intensive operation of existing producers. The Government will have to buy and own the added equipment. The details would simply provide for amortization and removal. Interest rate could well be that being paid by the Government. Labor-saving devices can solve the help question.

F. W. CARNAHAN.

San Francisco, July 26.

The Editor:

Sir—In regard to the War Minerals bill and a greater production of gold, the fact must not be overlooked that there are thousands of prospects and small mines in the West that prospectors and owners are holding in the expectation of selling to capitalists. As a rule the owners cannot sell them because there is not enough development done or value in sight for the mining engineer to recommend them.

We all know that a gold mine starts as a prospect and that most mines are made. The Government should put at least $5,000,000 (of the $50,000,000 that is to be appropriated for the War Minerals bill) to help the production of minerals in furnishing and building small mills for the small mine-owner, on the following plan: The mills to be of the portable type; several different kinds of these mills are made in California, ranging in capacity from two to ten tons daily, costing from $3000 to $10,000. These mills are so constructed that anyone with a little experience can run them. Several hundred of them on some of the most likely prospects would give a great stimulus to the production of gold and of other minerals. These mills should be put up and sold to the small mine-owner at cost, on time, to be paid for at the rate of about 10% of the gross returns. On this plan the Government would not be giving anything away, but simply loaning the small owner, like helping the farmer to put in his crops. One thing is sure, these mills would be used if they would only pay expenses while the owner was developing his prospect. It is a wonder we have had nothing of the sort started in this country long before. Some years ago such a scheme was tried successfully in New Zealand. The little mills were paid for in two years. [This system has been extensively adopted in Australia.—EDITOR.]

Most of the large smelters will not handle the ore from small mines at present. Gold production is on the wane and to revive it every method should be tried, such as a $20 bonus and no taxation. There are hundreds of these prospects and small mines here in the West and South that would pay on a small scale, worked by the owners,

with all overhead expense cut out, and helped by small Government mills, as suggested. Men, food, and gold are needed to put the German where he belongs. We have the men and the food; we can get the gold by going after it.

FRANK P. DAVIS.

Fluorine, New Mexico, July 31.

Interesting Minerals

The Editor:

Sir—Two interesting mineralogical occurrences have come to my attention recently.

The one is a specimen of native gold on native copper found by H. M. Lindsey of Ray in the Jim Crow mine, Grant county, New Mexico. The native copper is an irregular nugget of approximately 0.4 in. diameter and 0.2 in. thickness. It is partly coated by cuprite, on top of which malachite has begun to form. In a depression of this nugget there is a bleb of gold, about 0.1 inch in all dimensions. This shows distinct crystal-faces, which, however, have been marred by wear and indiscriminate knife-scratches. The Jim Crow mine explores a fissure-vein in andesite, similar to and near the old Carlisle, or Steeple Rock, mine.

The other mineral I found in the Gila Canyon Con. Copper Co.'s property four miles north of Hayden Junction, in Pinal county, Arizona. Here copper, dissolved from eroded limestone-beds, has partly been precipitated in quartzite and pyritiferous diabase. In a certain horizon of the diabase the pyrite is displaced by a beautiful ruby-red cuprite. As far as the narrow cleavage-planes permit, the cuprite assumes crystalline-structure; but besides replacing the pyrite it is also pricipitated on dendritic infiltrations of manganese oxide. These dendrites of cuprite are very beautiful, but the rock is so full of latent cracks and fractures that it is almost impossible to save good specimens.

W. TOVOTE.

Venice, California, July 27.

Vital Minerals

The Editor:

Sir—Vital as powder and ball, or beef and flour, for the successful prosecution of the War are a number of metalliferous ores, which are now mostly unworked, the mines lying idle throughout the United States; and the cause is to be laid on Congress, for mutilating and eliminating the stimulative value of the War Minerals bill, caused to be enacted by men who knew what they were doing. At present we have nothing that we can afford to waste, neither time nor supplies, so I will go straight to my point and leave detailed explanations to more capable men. I wish to call attention to the effect of the first War bill, and the 'blue and black flag' one later enacted by the House of Representatives. The bill as first drawn gave some encouragement for a gamble in the ores which are most needed, and mining men had gone to some expense to furnish those ores, and there would have been to have kept the price normal or reasonable. It is well known that there have been a few gold mines closed down; some are running on scant profit, and some nearly at a loss, because of the high price of supplies, which puts a low value on gold bullion. Now, a lot of those gold mining companies were going into the furnishing of the more vital metals, but since Congress spoiled the first minerals bill they have backed down, for no man wants to make a failure, and they have come close enough to that with gold. There are no more faithful citizens than the mining men, and what would our Army be without the mining engineers? I fear German propaganda is still in the air, and cannot be very quickly overcome by patriotism either, but it will be cleaned out, for the American people are smart, and only need to be aroused.

PROSPECTOR.

Robinette, Oregon, June 10.

The Miner and the Tariff

The Editor:

Sir—The economic conditions created by the War have proved that we have all kinds of metals and minerals, because the lack of shipping facilities has prevented manufacturers from supplying their needs from foreign sources. With the rise in prices due to the War, the American miner has been able to prospect, develop, and mine deposits that were supposed to be worthless. We now know that we have many of the most necessary minerals in almost inexhaustible quantities. The only requisite is a fair price for them. After the War is over and shipping facilities are again in operation between the cheap-labor countries and the United States, prices will go back to where they were before the War, perhaps lower in many instances; but if protected by a sufficient tariff their production will continue prosperously. It is up to the producers of the different metals and minerals to form a strong association to prepare for after-war conditions. If they do not, their business will become unprofitable and it will be necessary to discontinue, and thus permit their present business to pass to the cheap-labor countries of the world, principally South America and Asia.

The miner is unable to perfect such an organization. The users of the metals and minerals will not. It is up to the American producer. The organization should be national and include all the producers of such materials. They should do as the steel, wool, and other industries have done, namely, educate the public concerning conditions and requirements. If this is done, they will get the necessary protection; without it, they will not.

The assistance of the tariff has made possible most of our important industries. In our present crisis it has saved them. With a just tariff why should not other industries become equally as important, such as the mining and refining of antimony, chrome, tungsten, and magnesite.

Mr. Producer, save your business. Start the work while you can and your business can support it. It will

cost you a little money. Start and develop the proper organization or prepare to quit business, which otherwise you will be forced to do after the War.

San Francisco, August 10. W. K. Forest.

Hydraulic-Mining Debris

The Editor:

Sir—In the abstract of Gilbert's paper given in your issue of March 16 appears the statement that the capacity of water (as a carrier of debris) increases with discharge, and that when discharge is increased, the capacity per unit of discharge is also increased. This is the conclusion reached by Gilbert from the experimental work described in his previous paper No. 86 of the series, where he derives the formula

$$\text{Capacity} = K(\text{discharge} - k)^n$$

the exponent n being greater than unity. It is the case that the values of n derived from the original experiments varied above and below unity in the different sets.

I have devoted considerable study to the data presented by Gilbert in Paper No. 86, rejecting the adjusted values of capacity and obtaining them by interpolation from the original experimental data, and I am forced to the conclusion that a formula of this type is radically wrong.

In the above formula the increase of capacity relative to discharge progresses faster than discharge when n is greater than unity, at the same rate when n is unity, and slower than discharge when n is less than unity. The graphs of the three equations where n varies in this way show the curve concave upward, straight, or convex upward, as n decreases.

A careful examination of the plots of the original data convinces me that the typical curve is concave upward to start with; as it travels away from the origin the rate at which capacity is increasing faster than discharge becomes less and less and the curve reverses and becomes convex upward. In some cases the region covered by the experiments is such that only the earlier portion of the curve can be drawn, and there is no indication of its tendency to reverse. For these cases Gilbert derives n greater than unity. In other cases the curve begins to reverse close to its origin and here he derives n less than unity. As there are not usually more than four points on the curve obtainable, and experimental error is fairly considerable, a curve that shows the two portions can easily be drawn as a straight line covering the points fairly well and giving n as unity.

It is my belief that finally the curve reaches an apex and begins to descend, but the data do not extend to sufficiently high discharges to verify this. If it is so, it means that for given conditions of slope and channel-width there is a maximum capacity that cannot be exceeded, and can be considered in connection with the statement (also Gilbert's) that capacity can be reduced to zero by making the channel narrow and deep.

An algebraic expression for this kind of curve is given by $y = -ax + bx^2 - cx^3$ the apexing of the curve being provided by making the sign of the third term negative, and the observed fact that a certain definite discharge is necessary before capacity appears at all by giving the first term a negative sign also.

The relation of duty to discharge is obtained by dividing the capacity equation by x, giving

$$u = -a + bx - cx^2$$

the signs of the terms remaining as before, the locus of the equation being a parabola with an apex illustrating maximum duty for a particular discharge under the fixed conditions of width and slope. In the above equations y represents capacity, u duty, and x discharge. The maximum duty is reached with a discharge less and probably considerably less than that giving maximum capacity. In some of the experiments its region is covered by the data.

I must confess I have quite failed to establish the constants a, b, and c, for any of the experimental sets, such a task being extremely difficult on account of the few points on the curve obtainable and these points themselves being derived by interpolation from data that allow a good deal too much freedom in this respect.

It is interesting to recall an observation of Overstrom's that maximum duty is associated with a certain discharge per unit of width. My examination of Gilbert's data does not confirm this, but neither does it disprove it, the data in the neighborhood of the maximum duty being extremely shaky. If the Berkeley experiments are resumed it is sincerely to be hoped that a series will be run testing the variation of capacity or duty with varying discharges on a fixed grade or slope under flume conditions.

R. T. Hancock.

Jos, Northern Nigeria, June 4.

The Status of Gold Mining

The Editor:

Sir—Referring to my letter of July 27, which was published in your issue of August 17, the statement made therein as to the action of the executive committee of the California Metal Producers Association is in exact accord with the facts.

Since the letter was written, however, three members of the executive committee have been in attendance upon the American Gold Conference at Reno, Nevada, and have become convinced that direct financial aid extended by the Government to the gold-mining industry would not only be of benefit to the industry, but could be extended in such a way as not to cause damage to other financial interests. I have little doubt that were the other members of the committee to have the advantage of the same arguments that were advanced at Reno the majority of them would also be convinced. This being true, I think it safe to say that so far as the California Metal Producers Association is represented by its executive committee, it would now, if a vote were taken, be in favor of some form of direct financial aid.

Albert Burch.

San Francisco, August 19.

ITALIANS, AUSTRIANS, MEXICANS, AND OTHERS LISTENING TO A LIBERTY LOAN TALK ON THE PENNSYLVANIA RAILROAD

A New Bonus Plan

By A. M. HECKMAN

A fixed scale of wages, as used in the copper districts of the South-West, is fundamentally wrong in principle, because it does not take into consideration the individual skill of the workman, his age, length of service, job, or any of the factors that go to make up his real value to the organization in which he is employed. For a company employing a large number of men, however, it seems to be the only system that is practicable. Undoubtedly some of the copper-mining companies could afford to maintain a higher wage-scale, but it is also true that if a higher scale were forced upon all the companies, many of them would find it necessary to close down.

A NIGHT-CLASS IN ENGLISH FOR FOREIGN-BORN EMPLOYEES

There would be less copper produced; there would be less work for the laboring man, and the surplus of labor caused by such a move would be detrimental to him.

Again, it is not possible for mining companies in the same or contiguous districts to individualize wage payments. This would cause a greater migration of labor—a surplus in some places and a deficit in others.

The high rate of labor turn-over caused by the migratory type of men found in mining districts has been a source of considerable expense to the industry, and gives cause for serious thought. There is no question but what the cost of labor turn-over has been increasing rapidly, owing to the loss of skilled labor to shipyards and other Government projects, and the replacement of that labor by men totally unskilled in mining. There is also no question but what a man who has been in the employ of a company six months or a year is worth more to that company than a new man; his individual efficiency and earning power is greater, besides the fact that he has, to some extent, reduced the cost of labor turn-over. Up to a short time ago, however, there has been no way in which this individual effort and skill could be substantially recognized.

In this connection, in January 1918, the Phelps-Dodge Corporation, the Calumet & Arizona Mining Co., and the Shattuck-Arizona Copper Co., operating in the Warren district of Arizona, announced that every man who had been in their service continuously underground for one year would receive $100 bonus, with $50 for six months service. Surface workers were given $60 and $30, respectively. This bonus was not given as a reward for staying one year with the company, but rather as a recognition of individual skill. Fortunately, the Warren district has not been subject to the high rate of labor turn-over to the same extent as many other districts, because of the unusually good conditions of the camp, but the companies saw that a situation was arising that would need attention, and, as is characteristic of them, they sought a solution of the matter before it became serious. At this time the Copper Queen branch of the Phelps Dodge Corporation paid in bonuses $181,120 to 2286 employees. The average number of men on the payroll for the year was 3773, so it will be seen that two-thirds of them had been with the company six months or a year, and that but one-third was of the migratory type. This is especially significant when it is remembered that it was in July of this year that a general strike was declared.

The bonus plan, as declared at that time, was intended to be a permanent feature. The following statement was issued recently by the three companies jointly.

To Employees of Copper Queen Branch, Phelps Dodge Corporation:

When bonus was paid last January we stated that we hoped later that it would be permanent. This announcement has recently been made, and we desire to present the plan more in detail as follows:

1. After July 1, 1918, every employee who has remained in the service of the company continuously for one year will receive a bonus of $100 on completion of his year's service, and for each additional year of continuous service an additional $10 will be paid until the annual bonus amounts to $250, when no further increase will be made in the annual bonus.

2. The bonus is in no way related to the wage-rate, or kind of work done. It is a flat bonus for continuous service and the same amount will be paid to every employee regardless of his daily wage, monthly salary, or nationality.

3. In order to receive the bonus you must remain continuously with the company, but time lost on account of sickness or accident will not count against you after you return to work. Also you will be allowed to lay off for a total of 30 days during any year's service period, provided you obtain written permission from your boss or foreman and hand it to the employment agency before you leave. Your lay-off may be taken all at one time or may be taken a few days at a time, but must not be for more than 30 days total in any service-year.

4. Every man receiving a bonus last January will have his second year's service begin January 1, 1918, so he will be entitled to a bonus of $110 at the end of this year if his service is continuous according to the rules. Men who began work with the company after July 1, 1917, or since January 1, 1918, will be considered as in their first year's service until their year is completed. To illustrate, if you began work, say on July 5, 1917, or any other date after July 1, your first year's service will be completed on July 5, 1918, or a year after you began work, and if your service is continuous, in accordance with the rules, you will receive your first year's bonus of $100 on the next pay-day following the completion of any year's service. Those of you who began work last July, and have continued with the company since then have but a short time before your first bonus is due.

5. It is important that you observe the rule covering absence from work. If you lost time because of sickness you will have a company doctor and the records of our medical department will show that fact. If you lost time because of accident, the records of the medical department will show that also. If you desire to lay-off, even for one day, you should obtain permission from your boss or foreman, on the proper form for that purpose and hand it to the employment agent so that your record there will be clear.

PHELPS DODGE CORPORATION,
COPPER QUEEN BRANCH.
G. H. DOWELL, Manager.

It is not claimed that this plan represents the ideal method of payment for increased skill and efficiency: the ideal method would be based on individual effort and efficiency. While it is possible for a company with a full knowledge of its own business to measure individual earning-power and value, the factors governing such a thing are complex. Then, too, if it were announced to the employees of an organization that they were to be paid on individual ratings, the lack of understanding on the part of the workman would at once arouse suspicion.

Effect of Oxygen in Precipitating Gold From Cyanide Solutions

By THOMAS B. CROWE

*In regard to the precipitation of metals from cyanide solution by zinc, we hear little of the part oxygen plays in it. Caldecott says: "As the dissolving of gold is essentially an oxidation process, so its precipitation is one of reduction." All who have studied or worked with cyanide solutions will agree that Caldecott's statement is true. In the cyanide work in the mills of the Portland Gold Mining Co., oxygen always has been found to be the greatest enemy to precipitation.

A few years ago, while making some experiments on the effect of pressure upon the rate of dissolving gold from Portland ores, I made some bottle tests under vacuum. The results were surprising, and showed that under vacuum practically no gold dissolved, which confirmed my belief that Elsner's equation was true and also led me to investigate the amount of dissolved air carried by solutions at atmospheric pressure. The experiment consisted in partly filling an acid-bottle with mill-solution and connecting it by a rubber hose to a vacuum-pump. When the vacuum was suddenly applied, a cloud composed of thousands of small air-bubbles rose from the solution, showing qualitatively the amount of dissolved air contained in the solution, and also proving that the relief of atmospheric pressure on the solution permitted this dissolved air to escape. In studying the literature on the subject, we note Henry's law—"The amount of gas dissolved by a liquid is proportional to the pressure to which the gas is subjected." We find that at atmospheric pressure, water dissolves from 2 to 4% of air by volume. We also find that when air is dissolved by water, owing to the different coefficients of absorption of oxygen and nitrogen, the absorbed air has about 35% oxygen and 65% nitrogen, while ordinary atmospheric air is about 21% oxygen and 79% nitrogen. Mill solutions, then, contain not atmospheric air, but a per-oxidized atmospheric air, which is good for oxidizing but injurious to the reduction-process of precipitation.

In the early days of zinc-dust precipitation, the dust was sprinkled over the top of a tank of solution while under agitation; large quantities of zinc were used and the solution-tailing was far from what was desired. Later, Merrill's improved method came out, the principal characteristic of which was the exclusion of air from contact with the precipitant and the precipitate during precipitation. Merrill's method was a great improvement over the old scheme, allowing a material reduction in the quantity of zinc used, with much lower barren solutions, and plainly showed the effect of oxygen in former work.

Having had the sad experience of allowing free air to pass with my solution through the precipitation press, and knowing that Merrill's process had been an improvement over the old open-tank process, I naturally reasoned that the removal of the dissolved air from solution would be the means of further benefiting precipitation, providing a vacuum could be practically applied to solution, prior to, or during precipitation. Laboratory tests confirmed my theory. Large tests were tried, with the result that the zinc consumption has been cut in half. Having been successful in reducing the amount of zinc used, and as the price of cyanide kept soaring, we noted in a scrutiny of our former work that, for dissolving purposes on our particular ore, the cyanide-solution strength was higher than necessary; in fact, the solution-strengths in our mill had been reversed—the strongest solution was the barren; and, this being used as a wash on the filters, occasioned high consumption of cyanide. The high strength of the barren solution was caused by the necessity of adding lump-cyanide at the head of the precipitation presses to ensure low-grade solutions to be used in washing.

On the installation of the vacuum system, perfect precipitation could be maintained without the addition of lump cyanide, and today our mills are running with the highest strength of solution in the agitators and not in the barren-tank. This, together with a generally lower strength of solution in all parts of the mill, has allowed a material reduction of cyanide consumption.

Table I shows the amount of cyanide and zinc used before and after the installation of the vacuum precipitation.

	Solution precipitated, tons	NaCN per ton ore, lb.	Zn per ton ore, lb.	Zn per ton sol., lb.
1915	503,819	0.331	0.407	0.174
1916	536,455	0.320	0.369	0.150
1917, half-year	249,988	0.175	0.191	0.084

In the years 1915 and 1916 ordinary zinc-dust precipitation was used, and in 1917 vacuum precipitation. How often have we found, when working with zinc shavings, that the only remedy for poor precipitation, excepting the addition of lump cyanide at the head of the box, which has its limitations, is a clean-up or redressing of the box. Assays of the effluents from the different compartments of a box during a period of good precipitation generally reveal the fact that each compartment in the series is doing some work, there being a gradual reduction of the value of the solution as it progresses from compartment to compartment. A similar series of assays taken during a period when precipita-

*Abstract: Trans. A. I. M. E.; paper to be read at Colorado meeting, September 1918.

tion is only fair, the box being inclined to give erratic results, shows that the first compartments of the series are doing but little work, the burden consequently being thrown on those compartments lower in the series. A third series of assays, taken when precipitation is bad, generally shows that, not only is no precipitation occurring in the first compartments, but that the first compartment is giving up its gold, the dissolved metal being carried to the lower compartments and sometimes entirely out of the box. Decreasing the rate of flow of the solution through the box sometimes helps, and increasing the strength of cyanide also gives temporary relief, but a re-dressing of the box seems to be the only real remedy.

During precipitation, two opposing forces are continually at work: a precipitating and a dissolving force. The precipitating force is a reducing action and is caused by the dissolving of the zinc, which creates an electromotive force and evolves hydrogen. Nascent hydrogen seems to be the active agent that causes precipitation. The second, or dissolving force, is an oxidizing action, its strength being a function of the amount of oxygen carried by the solution.

Reducing-agent hydrogen and oxidizing-agent oxygen are determined enemies, and cannot live together in the same solution. When nascent hydroyen, caused by the dissolving of zinc in cyanide solution, is generated its first work is that of combating its enemy, oxygen, combining with it and getting it out of the way. After this is done, it takes up the rôle of precipitation and plays its part. When large quantities of zinc are dissolved and plenty of hydrogen is evolved, as is the case when lump cyanide is added at the head of the box, the effect of oxygen becomes insignficant, but when the strength of the cyanide solution is low and little zinc is dissolved, then the oxygen in solution may gain supremacy over the evolved hydrogen and result in poor precipitation or, in extreme cases, in dissolution of the precipitated gold. Especially is this true when the zinc has been in use for long periods and the first compartments are rich in gold and poor in zinc. A freshly dressed box presents more zinc-surface and, in a cyanide solution of a given strength, has a certain power to reduce and precipitate, this power becoming less and less as it does its work. This work consists of an exceedingly small job of precipitating and a large job of counter-acting the effects of oxygen contained in the air dissolved in solution. Why, then, allow this enemy of precipitation to pass with the solution into the zinc-press or box, when it can so easily be removed by the application of a vacuum during its flow?

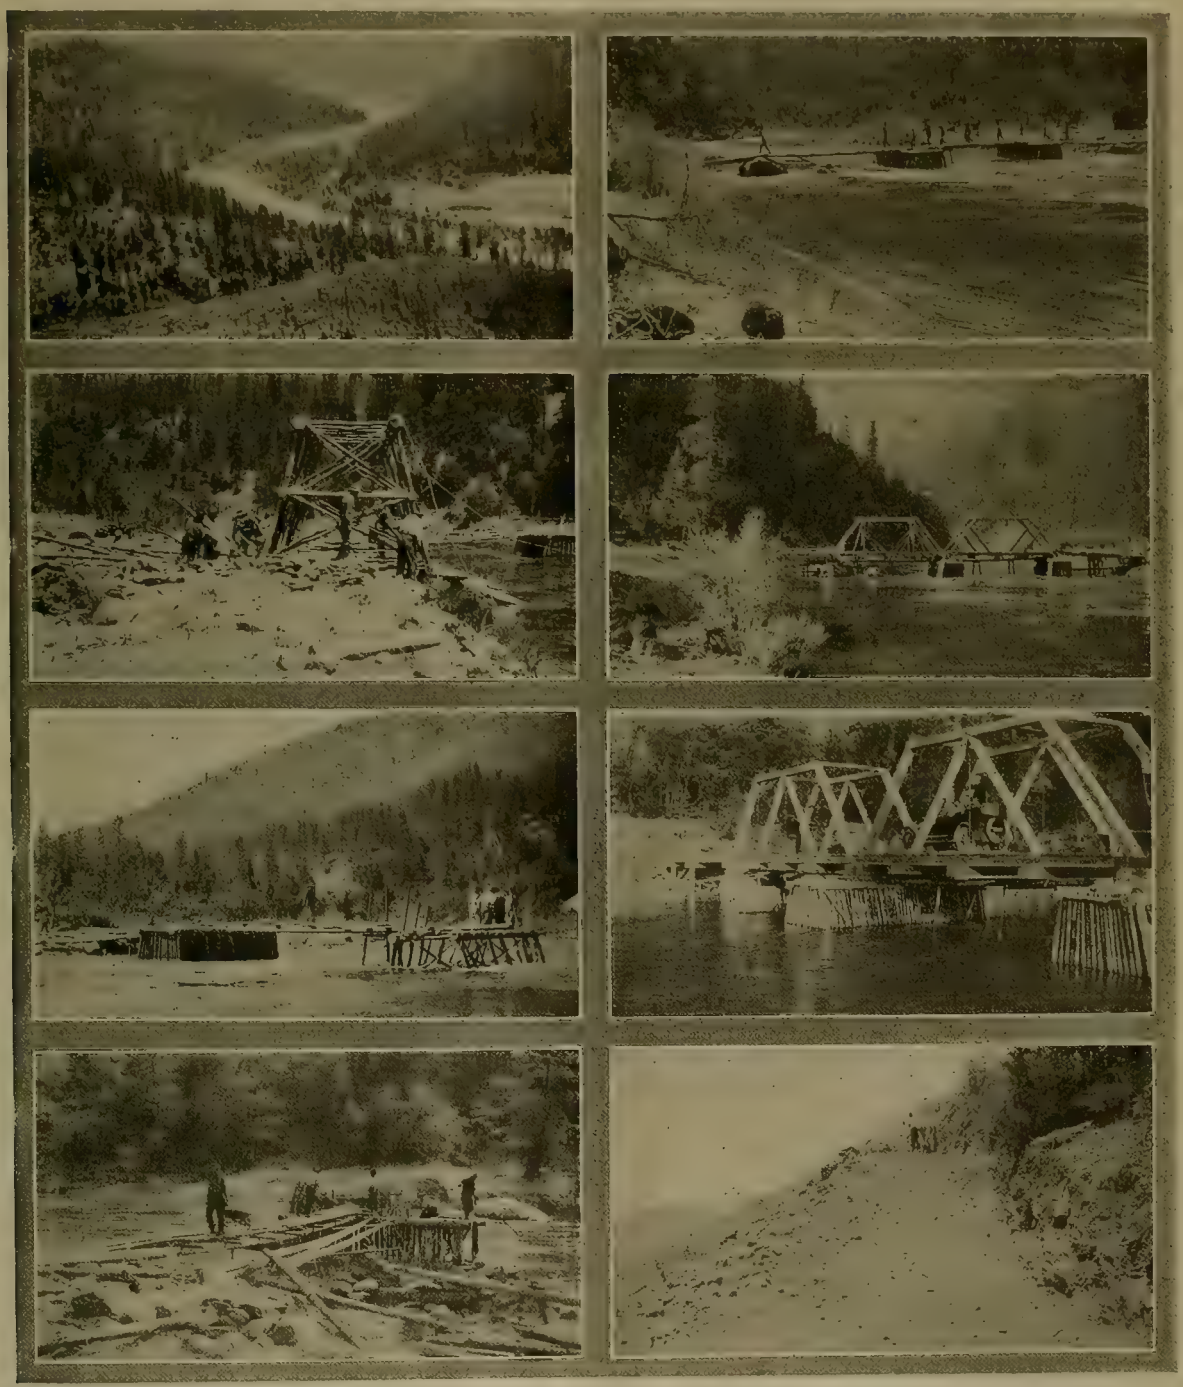
When the air in solution is removed prior to precipitation and the de-oxidized solution is run or pumped through the precipitating system, only the burden of precipitating is put upon the zinc and we find, when this is done, that a very weak electro-motive force is sufficient to effect precipitation, which means that one can operate both with weaker cyanide-solution and with smaller amounts of zinc, producing a precipitate of higher grade with less cost for cutting down and refining.

Bridges and Roads in Mining Districts

The search for chrome, magnesite, manganese, and other secondary minerals has revealed most of them to be in hilly regions away from road or rail. In all cases some means of transportation must be arranged, according to local conditions and the size of the deposit. One mine may be large and rich enough to justify the construction of several miles of expensive truck-road, or even railroad, while a mile of trail-making might be more than another could stand. Whether a man sled his ore down a hill at a cost of $10 per ton or build a road for $2000, over which it will cost him $2 per ton to haul it, will depend on whether he has at least one-eighth of 2000 tons to haul. The cost of roads and trails varies so greatly in mountainous regions that it is not advisable to begin any important construction of this kind without a survey and an estimate of cost by a competent local engineer. In all cases, the ingenuity of the mine-owner and the best use of local materials counts largely.

Sometimes it is necessary to construct a bridge over a stream between a mine and a railroad, and it is with this phase of the subject that these notes are concerned. In Siskiyou county, California, near Hamburg on the Klamath river, 50 miles west of Yreka, is the Klamath chrome mine, for which Samuel H. Dolbear is consulting engineer. This property is said to have considerable possibilities, so preparations are being made to mine and haul a large tonnage of chrome. Sled-trails aggregating 2000 ft. in length were built to connect the deposits with the truck-road. From the ore-platform to the county road it was necessary to build eight-tenths of a mile of truck-road. Work will continue during the winter, as the county and the Federal government are improving the main road to the railroad, and an aerial tram from the mine to the south side of the river will obviate sledding over the soft ground. Between the sled-roads from this mine and the truck-road flows the Klamath river. Here it is 150 ft. wide, the flow of water being 10 ft. per second. On May 6, 1918, work was commenced with 50 men, in charge of E. F. Waldner, temporary quarters being established on the south side. Photograph No. 1 shows the character of the country at this point, and the bridge that was built. Plenty of lumber was available, all being cut at near-by points. The type of bridge is known as the Burr truss, standing on crib piers. Photograph No. 2 shows details and launching of the first crib. No. 3 shows the cribs in place. These were launched by pushing them into the river. Fastened to each crib were three steel cables, two on the north side of the river and one on the south side. They were connected to home-made windlasses, which were used in tightening. The men pulled the cables taut and moved the crib into its final position, afterward using the cables to hold the crib in this position until it had been filled with rock. When in place, the cribs were surrounded with lagging, simply poles driven to bedrock in the river. Then the cribs were filled with rock—photograph No. 4 showing this being done—the two holding a total of 135 tons. As will be

seen in No. 5, a convenient rock—believed to be a projection of the bedrock rather than a boulder—served in place of a third crib. On top of the crib foundations, stringers were laid, upon which the trestles or trusses were constructed, and the bridge decked with boards. The work has been entirely satisfactory. When water is high in the winter the bridge will be removed, the piers remaining, provision having been made to do this within a day. Then the aerial tram mentioned will be used. The first carload of ore was billed out in 60 days from the time work was started. The daily output is from 25 to 50 tons of ore; eighteen 2 and 3-ton trucks are used.



READING DOWN, PHOTOGRAPH No. 1 SHOWS THE CHARACTER OF THE COUNTRY ALONG THE KLAMATH RIVER, CALIFORNIA, AND THE BRIDGE THAT WAS BUILT; No 2 TO 7 ILLUSTRATE STAGES IN CONSTRUCTION OF THE BRIDGE; AND No. 8 IS A VIEW OF ROAD CONSTRUCTION ON A HILLSIDE.

A Letter From the Front

Somewhere in France, June 14, 1918.

Here I am again upon this momentous anniversary and showing no ill effects for the year passed since I left the States, a year ago today. There has been a lot crowded into the last twelve months—it seems as though I were a little kid when I landed and El Paso seems like another existence. We took a terribly long time to get moving; the months of marking time at exercises long familiar for the benefit of commanding officers, to whom it was new, filled an interminable period, but we are in it plenty now. The next twelve months will be fuller of events than the last have been and I hope the long-prepared-for job will be completed in a good and satisfactory style. Every day we hear of new divisions entering the line, to the north and east of us, with the French and with the British. We also hear, aside from the newspapers, that their conduct has been very good. The French have plenty of artillery and the number of our infantry regiments and brigades gives one hope that we will soon be a considerable factor. The divisions around the Marne, they say, have done well in the face of large forces, have taken the offensive after losses and hard usage. If the newspapers did not so magnify every encounter of a handful of Marines into the stopping of the German drive, we could judge better. We have been in actual service about twice as long as any other division in France, that is, in the lines; in fact, our present tour is fast approaching the French record for length, and in that time have taken our sector, which was unorganized, and made it strong and good. The work has been remarkable, considering the activity of the sector: trenches dug, wire put out, dug-outs and artillery and machine-guns put in. A vast task. My men take to it in a way to please one. Twice the Colonel has expressed himself as much pleased at their execution of difficult work. They are developing a liking for the spade, a good symptom, and one without which men are not soldiers. It seems as though we have hit on more than our share, as we have had to change lines or re-organize half a dozen times in different places. It is good for the men, for, strange as it may seem, it is impossible to give them enough work when they are in the front lines. The four-hour night is used to the utmost, but by day the men must lie hid in trenches not deep enough to stand up in. One meal a day suffices, the bread being saved with some meat for consumption during the following day. It is a hard life, but the men harden so that there is remarkably little disease. Occasionally a little trench-fever, quickly over, and a touch of diarrhoea; at most a dozen men a month constitute the list of ailments. There is much less sickness now than when we came up, in spite of a long hard *tour* [turn]. After a pause, during which I rap on wood, I can state that my losses have been comparatively light, the least in the battalion, due purely to good luck, as we have had one more *tour* in the lines than the other companies. L Company suffered most, as much as any two others, I think, in this battalion. Serg't. Brown died of wounds and I was sorry. He was a good, little man, not excessively powerful but faithful and conscientious to a degree. Others who were with me are also gone. Serg't. Bateman is back, having recovered from his wound. He is the best soldier I ever saw and was much needed.

I got back my application for the Tanks, approved by the Major, but disapproved at Regimental Headquarters and all the way up. Everybody's else was, so I cannot kick more than they. I should like to get a staff job, not office-work, but operations of a suitable sort. Staying in the line you never get seen, while the boys on staff will get a great boost when the corps and armies are organized. However, it is said that Gen. March is fixing to make all the swivel-chair boys serve and make good in the line before they can do staff, so that active service in the line will be a requisite. Maybe then some of the line people will get in. Let us hope for it. On the other hand, being not seen has certain advantages in my case, because I have been living for a month or so with only "full field," that is, what one carries on his back. The result is hard on the appearance. A week in the lines plays hell with the beard, and the chalk which is everywhere makes the clothes look like the mischief, a process not improved by sleeping in them and never changing. Yesterday I got a bath and general clean-up. Triniman heated a large can of water and I disrobed and bathed, using the leg of a pair of drawers for a wash-rag. Unfortunately they started shelling the town before I got done, and I was impelled to dive into my dug-out with nothing on but a coat of lather, to the great hilarity of the runners, as I had been bathing in an old chicken house across the court. Triniman followed with the can and I finished in security. He also washed my (only) shirt and I donned clean underclothes, and shaved. The result was all that one could wish. I also got a new blouse, discarding one bought at Leavenworth a year and a half ago. This is a 'Tommy jacket,' one of the English blouses being issued to our men. It is greatly superior to ours; for some reason our blouses are always cut badly, tight around the chest and arms, so as to hamper one just as much as possible, and as I am disproportionately shaped just below the shoulders I never get into an issue blouse. This is, however, comfortable and amply cut, and being unlined is cooler than our issue. A change of underwear also serves to reduce the number of guests to whom one is host. A new sector is desirable in that it is not so infected with lice, but the accommodations are not so good as in Lorraine and Toul, so one has to sleep in close contact with the men who are all lousy, so we all have 'em plenty. Six weeks without a

bath makes it hard to keep them down, but they have the advantage of being easy to catch, unlike fleas, and can be picked off one's undershirt on fine afternoons, "reading your shirt," the men call it. Also a bath and clean underwear will free one of them, so all will be well when we get into a back sector again. More unpleasant is a particularly tenacious variety of itch, 'scabbies,' which a good many have, but I have not got it, so do not worry. Also the lice are not so numerous as to prevent my sleeping, so they are really a minor annoyance.

I am at present nicely located, the best in weeks, Capt. Irwin of K Company and I having a deep cellar in the outskirts of a small town in front of which lie our companies. The first thing done on the abandoning of a town by its inhabitants is for the military to rush in and get all the beds, box-mattresses being the rule here, and carry them off to their dug-outs. I have a particularly good one, the cellar is roomy and Irwin has a striker [batman or unofficial servant] who can cook, so we do finely. Rhubarb is in season and in all the gardens and as most people do not know it by sight we have all we want. Gooseberries also are to be picked by the strikers and strawberries are ripening. The onion beds are reaching sufficient maturity and peas are nearly so. There is still a little lettuce and another vegetable like spinach [probably sorrel] is plentiful. Today the mechanics found a few handfuls of asparagus. So when we can build a fire we can occasionally augment our rations. Unfortunately my company is so ill-supplied with cooks that I cannot spare one for an officer's mess. K and I companies have strikers who can cook and in L the cooks cook also for the officers, but Triniman is only learning how to put food together. I ate about a week ago with Paul Ransom, who has the machine-gun company, and had one of the finest meals I have eaten in France, the work of his striker. First, a wonderful vegetable soup, picked up in gardens around; then lettuce salad with onions and chives; then canned roast beef (tastily disguised under a sauce made of canned tomatoes), cabbage boiled with bacon, French-fried potatoes, rhubarb sauce, and a sort of Brown Betty of dried apples. These with biscuits, jam, cheese, and wine made a meal to feed a field-marshal. A striker like that is worth many times his weight in gold. I have an excellent caretaker, though, who for solicitude for my comfort is unapproached. Triniman is the 'Shorty' of Pattullo's 'Going-In' article and is not much longer than a full pack. He washes my clothes, heats water, makes up my bed or my pack, warms my food, and looks after my things in a way that leaves nothing to be desired. He does not carry tales, either to or from, nor get familiar when living with me. Also, he takes so little space that he is very handy in close quarters. He is Cornish. Before the War he contracted work in mines in Butte and made $9 a day and he is far superior in intelligence and character to the general run, so that he is pleasant to have around.

The town in which we now are is an ordinary little place with a long name, recently quitted by its inhabitants and already totally ruined by the German big guns. In this part of France the buildings are all frame, lathed, and plastered with clay. They last if kept up, but a 210-mm. shell will blow down a block and the concussion of guns will crack them to pieces, unlike the durable and ancient stone of Lorraine. For some reason the Boche got the idea we had troops in the town, and he ruined it in an afternoon. It had a fine church and he shot all afternoon until he busted it down. When a big shell lights in a ruined building the dust goes up to the sky and timbers fly in every direction. We live rather removed so few shells have come near. In fact, the Boches have thrown tons of great shells into the place and never touched a man during our stay here. It is a perfect marvel how many shells it takes to hit a man—days of shelling and not a casualty. I have led my company into a position in column of file with nine paces between men so that they stretched to a great length and passed through considerable bombardments without a man being scratched. One soon gets to locate where they are shelling and how to avoid such places and to choose safe routes. I got relieved from a town a while ago, and just as we started back, they started to shell. The men were in file in a long string and I gave the word to run for it, and we ran through a perfect hail. Nobody got out of place or ran faster than the rest, and as soon as we passed the shelled area all fell into a walk and went on as orderly as one could wish. No one was touched, but such an affair is hard on the company commander's nerves. Things have been comparatively quiet recently and I have got a little needed sleep the last day or so. Sleep is the hardest thing for company commanders to get. The paper work is as bad as ever and the necessity of keeping permanent records in rear makes it doubly hard. Of course, all we could leave behind we stored before leaving our training-area and when they sent word to settle up an account for goods bought by the company in Syracuse last November or something like that, it was impossible, a thing the higher-ups never thought of. Also when an order reaches you at dawn to send in the names of all graduate chemists by noon, it is hard to do so when the company is all in little disconnected trenches that cannot be reached by day; is it remarkable that the answer is probably "None in Co. M"?

Continued next day: I got a good sleep all right today. I went to bed about 6 this morning and slept till 2 this afternoon. Rose, washed my hands, face, and feet, and breakfasted. We had steak, French-fried spuds, doughnuts, prunes, cold slaw, jam, and bread, a damn good meal. So I am now ready for the day. We stay such a short time in one place that we never get settled, four to eight days, generally four. In quiet sectors where eight or ten days is the rule you can bring up stuff and have your bed-roll, but where you shift around so often it is not worth while trying to be comfortable or to make a good place. In the case of the men, we always make them work as much as possible making funk-holes and shelters, but beyond such quarters I do not try to get anything. Ordinarily a deep narrow trench is as good a thing as there is against shell, shrapnel, or bullets. If it is deep and narrow, shrapnel cannot get in and it takes

a direct hit by a shell to get a man in the bottom. And it is unbelievable how many will hit close without going in. Often they will hit the parapet and cave the place on the occupant, but the others pull him out and he is O. K. Of course, big stuff will blow up the whole thing, but it is costly shooting 6-inch at a crooked trench concealed by grass. When you have time you make dug-outs; that is, we do. In one place we were in a support position near a great ruined farm. We went there and got out timbers and set to work on dug-outs, real bomb-proofs made by mining. These are made by passing up the earth and timbering as you go. We started eight of them, two for each platoon, each with two stairs. In four nights and sometimes by day we got the stairs down 20 to 40 ft. and had started on the chambers at the bottom in the deepest ones. The trouble is that not all organizations work well and pepless people come along and take over and never carry on your work. We went into one place where a battalion had been eight days, following the French. They were very close to the Germans, only 40 yards in a wood and had not done a thing. They had little disconnected pieces of trench over about 200 yards of front, no shelters and no wire. We connected up the trench, put in wire—a ticklish job at that range—and started dug-outs, so that the next people in were O. K. Moonlight is a fine thing for work in the rear echelons and for carrying parties and chow details, but for wiring and digging front-line trenches a good black night is what one likes. In going into a new place, the men are spread in twos and threes across the front to be covered as early at night as possible, and start to dig in. By dawn they will be down three or four feet. They lay sticks or tools across, a poncho over these and grass, etc., on top, as a screen from the sun and aerial observation. This is improved by deepening and undercutting the parapet.

I saw Hawkinson recently when I relieved him. Two days before he had led the extreme flank of an attack. He took his objective after heavy loss, but the company next him failed, so he was left with both flanks exposed in an advance position. When the position was taken he could only locate eight men and with these he set about organizing. They took all the German and American rifles and ammunition from the dead and got into shell-holes, and their machine-guns not having come, they beat off the first counter-attack with rifle-fire alone. Their resistance drew scattered men till he had about 35, he being the only officer left. He sent out all day trying to hook up with the next company, but in vain. They started to dig in, which drew a hail of fire, but, as he said, "surprisingly few" were hit. They finally found out how to dig and put the earth in the shell-holes and so organized a position. They gathered all the guns and ammunition, and water, and rations off the dead; and prepared to stay. In the afternoon came a violent counter-attack with tanks. These were put out by artillery, but the infantry came on in waves. Being isolated and his position being unknown, he got little artillery support, but completely repulsed an attack in force, with rifle fire. As he said, they lay in their shell-holes and knocked them over as fast as they came on, each man with several rifles firing as hard as he could till the Germans desisted. We got prisoners who corroborated this; almost the whole counter-attacking force was destroyed. Then at night-fall, his ammunition being nearly gone and no connection being established with the next company, he fell back. I met him going out; his company was on its way safely and he was just as funny as the night we tried him by general court at the class-meeting at Leavenworth.

For training, one day here is worth three in the States. To walk from the front line straight back is an education, for you see in operation all the things you have learned about. In coming up from the rear clear back, where the War has not been nor soldiers billetted, the signs of war are wagon-trains on the main roads, engineer trains on the move, artillery passing along, and refugees always streaming back on high-piled wagons. It seems as though people remain at home till they lose their nerve all at once, because they will flee after months of occupancy, leaving everything in place, not even carrying off clothes. Then gradually you come to towns with soldiers, hospitals in the larger places, more traffic on the roads, motor parks and engineer parks; then towns with more soldiers, gradually increasing till they overflow into all the woods and the roads are choked in the evenings with trucks and wagons hurrying to get up soon after dark. During the day only staff cars and motor-cycles are seen, but late in the day the traffic is immense, run by French military police like railroads, only better, so that the roads do not cross nor traffic mix. Every wood has some sort of park, the towns are full, and the inhabitants are fewer and fewer, also the towns begin to look badly, if not from long-range fire at least from neglect. You begin to see airplane-bomb holes, for the Boche is everhead every night. The field-hospitals are now passed, and you begin to come to ammunition dumps, acres of shells spread over the hills, each pile far enough apart so an explosion would not set off the next pile. This spreads over a great extent, more than you would think possible. Now, if it is day, you are nearing the line of sausages [fixed balloons], which are about a mile apart and form a great fringe on each side of the lines, a guardian airplane in front of every couple. These monsters look like maggots and you can see a dozen stretching along several miles back of the lines, with men watching the enemy's rear through high-powered 'scopes. Along here you pass big guns, long marines at the back, howitzers farther up. These guns run to great size, as big as our coast-defense guns. They shoot up our town every day with birds as big as the disappearing guns at the Presidio and there is a 3.40 hole within a hundred yards of where I sit. It is funny how you get used to things. We used to think 105's were big stuff and now it takes a 210 to make one listen to it.

To continue our trip to the front. From about this point the country begins to look badly. The towns are ruins, completely so within three or four miles, and subject to frequent and violent shelling. The roads are full of holes or patched with broken brick, trees cut

down, and large holes in the fields around; especially is this true around cross-roads and forks, which are particularly unhealthy. One hurries through the towns as fast as possible, or, if taking a company on relief, tries to avoid them altogether. There is no traffic over these roads except a few necessary runners by day, and by night there are troop-wagons and trucks regardless of fire. Gradually one abandons the roads and takes obscure paths across the fields. The grain is high all over this part of France now, so paths are easy to find. Valleys are particularly subject to fire, so one hurries across them and finally reaches the communication trenches, if there are any. In a new sector they are the last improvement to be made, and everything is across the top. In the valleys there is every indication of war, a steep place under a bank is generally a place to scare the timid and to hurry by at night. I lived for four days on the edge of a hill with a small wood on it. I had a dug-out in a little hole under a bank where shells could not drop. It was pretty good except that a team of horses had been hit just in front of the door and it kept us busy burying them as we found the parts. Below, in the valley, was a sight to cure the romantic of any wish for war. Dead horses poisoned the air, the far side and floor of the place were so covered with shell-holes that not a bit of earth remained unturned. Around the battalion-aid station lay a group of dead, wrapped in ponchose, who had died on the way from the front trenches the night before. Wounded have to wait till dark to come out, and those who die meantime are buried at about this point the following night, so that no matter how many the support company buried there were more to do the next night. Equipment taken from them lay all about awaiting salvage, both German and Americans, like the bodies. We gradually got this gathered up, the bodies located and buried, the horses covered and the place a little more shipshape, but you can figure it was no sweet job, as H. E. [high explosive] does not do tidy work. From here to the front lines is a 400 to 1000 or 1500 yards and a C. T. [communication trench] runs out there. However, at night every one goes over the top, carrying parties appear as you go out, hurrying to the rear after bringing ammunition, tools, and wire, or working parties who have been digging and now must hasten at the approach of day, or chow parties with cans of rations, each man with a rifle over his back and moving in a long file out out of the dark into it again. You stumble over trenches, trip on the telephone wires used during the attack a week ago, and fall into shell-holes, but your guide, with the vast experience born of two nights in the sector, picks his way unerringly, and at last you come to a trench rather deeper and more used-looking than those in rear, and you follow it. By now caution is necessary, as the flares which go up frequently are near and as they climb from the ground down you go and wait till they die out. Also, one keeps near the trench so as to pop into it in case of M. G. [machine-gun] fire, which often sweeps the parapet. The men in the trench are fairly invisible except as a flare shows them watching. A grunting fatigue party is deepening the trench in a shallow place, a covering party 50 yards out protecting them from surprise. If you were not hurried along so, you would stop to admire the Boche fireworks: one, two, and five-star green or red rockets, different white rockets, caterpillar strings of light, of immense length—40 or more in a string—a great fountain of sparks placed back of the lines, a brilliant red rocket which hangs in the air and turns to white, and a rocket which shoots two balls of light close together incessantly. The Boche is great on pyrotechnics and when he is nervous it is a great sight. We pride ourselves on how few we shoot, frequently going a whole *tour* without shooting a flare. I think it best not to disclose our position, and also if the men get to looking by means of flares they think they cannot do without and will flare all the time. Some company commanders believe in illumination, but I do not and my company never fire them. We also seldom fire our rifles or automatics, preferring to keep our disposition hid; also firing makes the men nervous and reveals their nervousness to the enemy. The small amount of fire is a test, I think, of a company's self-assurance. All this time, however, we are following the front-line trench till we come at last to the man we are to visit, Withers rushing somewhere at a great rate or Logan very jaunty leaning on a bamboo stick (bought in Nice and appropriate thereto). If the former, the shape in the vicinity is Serg't. Beever, who says, "Good evening, Captain," with a flourish as though to say, "How's the boy, old top?". If it is Logan, Serg't. Jake J. Cooper obscures a lot of the horizon, looking so much like Bairnsfather's 'Old Bill' that it is laughable. The P. Co. [Post Command] is only a cavity under the parapet exactly like the men's funk-holes, but we creep in and hang down a poncho outside so that we can light a candle. A canteen of cognac is produced, if it is cold or you have been shelled on the way in, and a nip is taken—and, believe me, a little hurts no one under the circumstances. Then you go over the sector, which as far as you can see consists of following a trench and then leaving it to plunge across the open toward the German lines, coming at last to a little piece of trench or an organized shell-hole with three men in it for listening post. After visiting several such and the platoon sectors and swapping gossip with the lieutenants, who anxiously inquire on the chances of a relief of the division, you have seen all there is to see, and you start back. Just as you start it seems as though Fritz got a sudden interest in your line of retreat. He suddenly begins firing on the head of the C. T. [communication trench]. You turn aside and start to parallel it, guided by the stars. He lengthens his range and drops 'em along the length of it. Where you pass through the wood they are tearing trees to pieces, so you prudently go round. The crossing of the valley is as bad, so you cross lower down. Then just as you reach the road—Pow! here they come! This, however, is not heavy and by watching you find they are shooting one a minute at a road-fork. You close up as close as you can and then just when one hits, you run forward and pass before the next comes, dropping in the ditch as you hear another

coming. It is strange that as you go up, all the way you have the sense of getting into increased danger, so though one place is the same as another in the first three miles or so, you have a feeling that you are getting close every time you go over a hill; conversely, as soon as you are relieved you feel O. K. when you get 200 yards, though they may be shooting up in great style a mile and a half back, ahead of you.

It is now the close of another day, and this letter has been going for three days, so it must close. We shift again tonight, and as it is about a quarter of nine, I must begin to get ready. As you see, there is much that is unpleasant in the life, but one learns to enjoy his pleasures more keenly. The sun is never so fine as when you creep out of your burrow on a fine calm morning and warm yourself. Off comes the shirt and undershirt, and are inspected, then you lie around and enjoy the air. Also when you get a chance to go back to where your kitchens are, a few miles back, how fine are the wheatfields full of red poppies and cornflowers, and the little woods full of thick grass! Altogether it is very satisfactory, a work for men to do, and though we all kick and crab at injustices done us, mostly imaginary, I suppose, and at the ease in which others sit in Paris and the rear, they will never know the satisfaction, for instance, of examining the airplane photographs of the new trenches you dug, and of pointing out where you drove the Boche out of his positions and incorporated them in your own, to correct the line.

A Flowing Dump

The accompanying illustration represents a dump that is steadily flowing like a plastic mass, although the pieces

CHLORITE-SCHIST DUMP AT PIEDRA, CALIFORNIA

are broken to the usual size of mine-waste. The material consists of chlorite-schist associated with magnesite, coming from the Piedra mine of the Piedra Magnesite Co., in Fresno county, California. The angle of the slope, over which the schist has spread from the end of the tramway at the mine-mouth, is only about 12° from the horizontal. Owing to the anti-friction property of the chlorite-schist it constantly creeps down this extremely flat slope, spreading in the shape of a fan from a width of 20 ft. at the top to 75 ft. at the bottom. The mass flows so rapidly that it is nowhere more than 18 in. thick. The schist disintegrates on exposure to the air, facilitating its movement. Within the mine the schist constitutes the hanging wall of the magnesite deposit. The footwall generally consists of a variety of serpentine, here and there replaced by amphibolite.

ALUMINUM-BRONZE containing iron can be commercially used for die-casting. H. Rix and W. Whitaker found this metal superior to brass (60-40) containing about 2% aluminum, and to manganese brass for the reason that in the case of the last two metals the die becomes rapidly coated with zinc oxide, which spoils the definition of subsequent castings unless removed. The tendency of the metal to form pear-shaped cavities can be eliminated by a study of grating, venting, and the like. Promising results were obtained with alloys containing 7 to 10% aluminum and 1 to 4% iron. One of these alloys is being cast commercially. Twenty-four test-bars of this metal cast in a one-inch chill, and cooled in air, gave the following results when tested: diameter of test-section 0.564 in., yield point 14.7 tons per square inch, ultimate tensile strength 35.5 tons per square inch, elongation on 2 in. 24%, and reduction of area 21.8%. The alloy is sufficiently fluid to fill the die and to give satisfactory castings over a wide range of temperature, but the authors recommend accurate pyrometric control if consistent results are required. The best material for dies was found to be a close-grained cast-iron, as hard as is consistent with good machining properties. No facing or special treatment of the dies is necessary, but the steel plugs are dipped in a graphite wash between casts.—Jour. Inst. Metals.

TIN USED IN THE SILK INDUSTRY. Silk is easily weighted, and because of its costliness there is a temptation to carry the weighting with cheaper materials to a point where the wearing qualities of the silk goods are adversely affected. There are two general methods of weighting; (1) by the use of vegetal or organic matter, and (2) by the use of metallic salts, particularly tetra-chloride of tin. The first increases the weight, but does not materially affect the fibre; the second is apparently not injurious if carefully applied in reasonable amounts, but if used to excess it destroys the silk. Tetra-chloride of tin is obtained by treating scrap-tin with chlorine gas or with hydrochloric acid, the scrap-tin being waste from tin-plate mills and from old tin-cans. It has been estimated that the American silk industry requires annually from 6000 to 7000 drums, of 900 to 1000 lb. each, of tin tetra-chloride, which contains 45.4% metallic tin. The tin salts are fixed on the silk by successive baths and about a third washes off to be recovered and re-sold. One of the largest silk-dyeing companies estimates that the actual metallic tin sold with silk goods in this country amounts to nearly 1000 tons per annum.—U. S. Tariff Information Series No. 3, 1918.

DURANGO, COLORADO

Operations in the Silverton, Red Mountain, Telluride, Ophir, and Rico Districts.

Silverton.—The Iowa Tiger mine and mill is working steadily on three shifts, shipping a good deal of concentrate.

The Telescope Mountain Mining Co., consisting of Colorado Springs men, has opened a promising vein at Chattanooga, and has shipped a car of ore. There are several carloads ready.

The Mears and Wilfley flotation mill has resumed treating tailing from Silver Lake basin, and has shipped a car of concentrate.

The Anvil Leasing Co., managed by E. Johnson, has added the Diamond, Topaz, and Sapphire lodes to its holdings. All of them adjoin the Emerald lode on which the company is leasing. All contain copper.

A Kansas City, Missouri, company has been formed to

PART OF THE SAN JUAN REGION, COLORADO.

operate the Little Nation mine, under the name of the Little Nation Mining Co. The new owners have shipped a car of ore, and expect to ship steadily.

The Gold King Extension Mining Co. is composed of leading Colorado men, backed by Boston people. W. Z. Kinney is manager. The whole property is well tunneled, and the workings are in excellent condition. The ore contains copper, iron, gold, and silver. Rich pockets of gold ore are sometimes found.

With the opening of the Gladstone branch of the Silverton Northern railroad shippers are loading cars. The Lark at Henrietta, and Venus at Gladstone have resumed shipments.

Red Mountain.—The Red Mountain branch of the Silverton railway is open and all roads are passable. Heavy rains caused some delay.

The Red Mountain Mines company, managed by George Collins, is developing a large body of pyrite near the Joker tunnel. The Yankee Girl is being re-opened by the Red Mountain company. There is a large quantity of water in the lower workings where the richer silver orebodies were worked, but it is expected that they will be pumped dry in the near future.

The Kapegi Leasing Co. will again work the Congress mine, and is now shipping at the rate of five cars per week.

The St. Paul Mining & Reduction Co. has leased its holdings at Summit to Schafer & Ross for the current year.

Telluride.—The Lewis Mining & Leasing Co., operating at Smuggler Union properties, has started shipments. The mill is concentrating 25 cars daily, and with the addition of another unit will increase the capacity to 60 cars. Five tons of concentrate are loaded each day.

Ophir.—Despite climatic handicaps and the recent fire, the Alta mines, of the Belmont Wagner company, are ready to ship. The new mill is almost completed. Construction was carried on during the entire winter, although the snow surrounded the workings to a depth of 10 ft., and the labor shortage was acute. The tramways have been restored since the fire, and will continue carriage of ore from the mine to mill, until the Black Hawk tunnel is completed.

J. M. Belisle has secured contracts for supplying metals to munition works. He has a number of good manganese, molybdenum, uranium, and carnotite claims in Paradox valley, but has a difficult problem as the claims are 75 miles from rail.

Rico.—The Rico Argentine is not shipping as heavily owing to shortage of labor, and other factors.

The Engel claims on Expectation peak are the scene of great activity. A car of ore has been shipped, the forerunner of a steady output.

CRIPPLE CREEK, COLORADO

New Developments.—Lease Notes.—Water From Roosevelt Tunnel.

The lease on the property of the Rose Nicol company on Battle mountain, adjoining the Portland estate on the north-east, has been transferred by the Camp Bird M. L. & P. Co. to the Reva company. Ore has been opened on the tunnel-level of the Rose Nicol, while veins are also being developed from three levels of the main shaft.

The Modoc Consolidated, operating through the Last Dollar shaft, on which the company holds a bond and lease, is shipping ore from this Bull Hill property. Plans are being prepared for a large new ore-house.

It has been officially announced by the Portland company that a shoot 4 ft. wide, averaging $30 per ton, has been cut on the Roosevelt tunnel-level in Portland ground, at a depth of 2131 ft. This ore pitches south into an area not considered especially productive. A second discovery has also been made on No. 19 level of No. 2 Portland shaft. This also pitches south.

A small sacked lot of ore from the Ella W. on Tenderfoot hill, sampled by the Eagle Ore Co. last week for M. Johnson, was settled at $63 per ton. This was mined at a depth of 35 feet.

The flow from the Roosevelt tunnel last week was 3350 gallons per minute.

Operations in the main heading of the Roosevelt drainage-tunnel were not extended during July, but the Portland cross-cut was advanced 210 ft., and the heading of the lateral is now 1126 ft. from the main tunnel, at a point about 1000 ft. from the shaft. A vein, 4 ft. wide, assaying $30 per ton, has been cut by this work on the tunnel-level at a depth of 2131 ft. below the collar of the No. 2 Portland shaft. The Cresson drift was advanced 120 ft., and its heading is now 1301 ft. from the starting point in the tunnel. In addition a station was cut 10 by 12 ft. and a cross-cut driven 18 ft. from the station, a total of 186 ft. in Cresson territory.

The Cresson company's profit in June was $130,927. The usual monthly dividend of 10c. per share, equal to $122,000, was paid on August 9. This makes $6,661,162 to date. Cash in banks totals $1,038,551, plus 30 cars of ore valued at $25,000. Ore-reserves on July 1 were estimated as worth $3,128,956, an increase of $360,231 since the last measurement. The new ore-shoots on No. 7 and 10 levels have been developed sufficiently to allow of their being included.

The Portland company is to consolidate its Victor and Independence mills. This will result in more economy, and relieve the labor shortage.

MAYER, ARIZONA

Diamond-Drill Practice in the District.

Interesting results are reported from diamond-drilling in the Blue Bell and Binghampton mines in this district. The prevailing schist formation, in which the ore occurs, is vertical or nearly so. The ore is found in lenses which conform to the angle of the formation. In the flat porphyry deposits of copper, prospecting with drills is done by vertical holes, while in the schist-zone in this district the holes are all bored horizontally, cutting the formation east and west. This work is being done on a deep level of the mine. The Arizona Binghampton company leads in the amount of diamond-drilling done so far here. Cannon Brothers Exploration Co., formerly of Butte, are doing the work. F. G. Cannon manages the work at the Binghampton mine, and a brother has a number of contracts in the Oatman district.

A Government permit is now necessary before diamonds can be purchased. A buyer must satisfy the Government that the stones are to be used for drilling in the United States. Since a great deal depends upon the quality of the stones, Cannon Brothers usually make their purchases of diamonds from lots sent from the East to a bank where the selections are made. Formerly, black diamonds weighing 1¼ carats were used in the bit, six to the set. It has been found that diamond 'chips', about 12 to the set, do better work. The diamonds in a drill-set are worth $1000, the cost of the black diamonds being about the same as the brilliant. A bit will drill from 40 to 60 ft. without needing re-setting. The cost per foot for diamond wear is 50 cents. The cost per foot of drilling is from $2.50 to $3. It is necessary to employ two men, the runner and the helper. The runner receives $6 per day and must be experienced.

The apparatus machine used in the Binghampton is known as the Sullivan Type E, a small single-cylinder machine using 1¼-in. bit. The core is ⅞ in. diameter and 5 ft. long. The holes in both the Blue Bell and the Binghampton are from 100 to 200 ft. long. They are not spaced at any regular distance, but are usually around 100 to 150 ft. apart. One 8-hour shift can drill 15 ft. As much air is used by the diamond-drill as is required for two Leyners and as much water as for one Leyner.

A total of 7000 ft. has been drilled in 45 holes at the Binghampton. The company proposes to do twice as much drilling in the next few months. The Blue Bell work amounts to 23 holes, from 100 to 200 ft. long and 120 ft. apart. Most of the drilling in the Blue Bell has been done on the 800-ft. level, while in the Binghampton, several levels have been prospected. The average core recovery is 100% in the quartz and ore formation, and about 85% in schist.

The main object of diamond-drilling by this method in the Mayer district is to discover orebodies that are supposed to exist in the mineralized zone. The cost is one-quarter that of driving drifts. After a level has been drilled, a definite plan of development can be carried out by drifts. Recently, an orebody of considerable importance was found by diamond-drilling on the 400-ft. level of the Binghampton, only 30 ft. from old workings. In the Blue Bell, a lens of ore was picked up on the 800-ft. level in virgin ground far to the north of the developed orebodies. In both mines, a great deal of time and money has been saved by this method of prospecting.

Diamond-drilling in this district is looked upon as another great improvement over past methods. The ore—both the copper and the more complex gold, silver, lead, and copper ores—is especially amenable to oil flotation. The smelter at Humboldt is well equipped to handle the custom business in concentrates from the flotation mills. The Mayer Ore Purchasing Co. is operating its custom mill now, offering a market for ore in small or large quantities. What the Mayer district needs most is more capital to develop the many excellent prospects.

The report of the Consolidated Arizona Smelting Co. for 1917 may be summarized as follows:

Property: mines at Mayer and Middleton, and concentrating plant and smelter at Humboldt, Arizona.

Operating Officials: G. M. Colvocoresses, general manager; W. V. De Camp, superintendent.

Financial Statement: value of metals produced was $5,606,641, of which $881,816 was profit. In 1916 this was $859,015, and in 1915, $194,943. Reserve for working capital, $400,000, depreciation, $264,973; taxes, $88,790; dividends, etc., reduce the profit to $29,728. Balance from 1916 was $390,204, and that to 1918, $169,632. Current assets total $982,411, against $455,054 liabilities. All of the mortgage bonds were retired in 1917.

Dividends: two absorbed $166,300.

Development: at the Blue Bell mine the main shaft was sunk from 1000 to 1200-ft. depth. This cost $58.43 per foot. Also 3461 ft., costing $13.51 per foot, mainly on No. 8, 9, 10, and 12 levels. A new 'blind' orebody was found above 700 ft. Results in 1918 should be much better than in 1917. The mine is equal to producing 400 tons daily.

At the De Soto mine, 532 ft. of work cost $11.20 per foot. Results were not encouraging, and the future depends on work done in 1918.

Reserves are estimated as follows:

Mine	Tons	Copper, %	Gold and silver
Blue Bell	536,800	3.1	$2.00
De Soto	66,200	3.0	2.00

Concentrator: this plant dressed 106,226 tons of ore, 61,689 tons from the Blue Bell, 39,330 tons from the De Soto, and 5207 tons of old tailing. The average copper content was 2.976%, and gold and silver $2.19 per ton. Extraction was 90.4% copper, 74.95% gold, and 74.22% silver. Milling troubles are not solved yet, especially in the grinding department, which is being improved.

Smelter: these works are considerably improved. Seven large and 55 small mines supplied custom ore and concentrate. Including 33,804 tons of concentrate from the company's mill, the furnaces reduced 138,781 tons of charge, extracting 87.94% gold, 95.02% silver, and 90.70% copper.

Production: 8,213,611 lb. copper, 6620 oz. gold, and 169,778 oz. silver from company ore; and 11,537,427 lb., 2865 oz., and 81,892 oz. from custom ore.

Costs: on a per ton basis these were:

Mining, ore delivered at smelter	$3.290
Milling	1.776

On a per pound basis they were 14.98c. for company ore.

ALASKA

Anchorage.—A number of important discoveries have been made during the present season, and the district has been unusually active.

Control of the Gold Card mine in the Willow Creek district has been purchased by Frank Bartholf of Billings, Montana, John Smith of Los Angeles, California, and J. B. Swan of Henrietta, Oklahoma. The new owners will develop the mine during the coming year and erect a mill next summer. They will also develop hydro-electric power for their own use and supply other mills in the district. William Martin has a lease on the property at present, and is milling high-grade ore at the mill of the Alaska Free Gold Mining Co. The vein is from 10 to 14 ft. wide.

W. F. Rock of Denver has purchased an interest in the Miller Bartholf property, and is making arrangements to erect a mill.

Juneau.—The report of the Territorial mining inspector—William Maloney—for 1917, is just to hand. The interesting points show the cost of supplies in many instances to have risen 200 per cent in three years, the stream tin output was 232 tons (about 70% metal), antimony mining continued on a small scale, tungsten mining promises to contribute a good yield, coal was mined to the amount of 61,000 tons, a mine-experiment station was established at Fairbanks, provision has been made to start a mining and metaliurgical school, and generally there was ample labor throughout the Territory. The principal lode and placer operations are detailed, also accidents in the mines. A list is given of the operating dredges, lode, and placer companies.

Kennecott.—Copper production of the Kennecott company in July was 5,090,000 lb., compared with 10,750,000 lb. in 1916.

Sitka.—Nickel ore has been reported at three localities in Alaska—on the west coast of Chichagof island, near Copper river, and on Knight island, Prince William sound. The deposits on Chichagof island and near Copper river were examined in the summer of 1917 by R. M. Overbeck, of the U. S. Geological Survey. A brief statement of the results of that examination follows: The nickel deposits of Chichagof island are situated on the west coast of the island, 3 miles north-west of Pinta bay, or 65 miles north-west of Sitka. Development consisted in 1917 of a 180-ft. shaft, with 155 ft. of drifts at the 80 and 180-ft. levels, and of several prospect holes. Neither the outcrops nor the underground workings are of sufficient extent to permit any reliable estimate of the amount of ore that may be present at this locality. Orebodies of this kind are generally irregular. The amount of ore shown in the present workings therefore does not justify large investments in facilities for mining, ore treatment, or shipping. The amount of ore available and the geologic conditions at the locality do, however, encourage the hope that workable orebodies will be developed, and justify the expenditure of a moderate amount of money in blocking out the known orebody and in the search for other orebodies. The Copper River nickel locality is situated near the headwaters of Canyon creek, 13 miles east of Copper river, opposite Mile 121 on the Copper River & Northwestern railroad, at an altitude of more than 4000 ft. Mining claims have been located on the outcrops of basic dikes which cut the schist. Only a little underground work has been done. Pyrrhotite and chalcopyrite are indentified at a few places, but there is no evidence of extensive mineralization. The amount of ore cannot be estimated on account of the small amount of underground work and the fact that at one locality, at least, the orebody has been faulted. A selected specimen of ore contains 7.23% Ni and a trace of cobalt, but most of the known ore is believed to be of much lower grade. A nickel deposit is said to have been discovered on Knight island, Prince William sound. It is reported that this deposit was being prospected with a diamond-drill in the summer of 1917, but the locality has not been visited by any member of the Geological Survey, and no authentic information is available.

Valdez.—The Columbia Red Metal Copper Co., operating between Long and Cedar bays, has erected a sawmill. A monorail tram is being built from the beach to the mine. High-grade ore is to be shipped, and a mill is to be erected later on. C. C. Elwood is manager.

The Free Gold Mining Co., in the Port Wells district, has opened rich ore at a contact of granite and slate. A 5-stamp mill is being erected.

ARIZONA

Bisbee.—The Copper Queen Branch of Phelps Dodge, and the Calumet & Arizona company, have announced a new housing plan for Warren. It provides that the companies will build homes for their employees on plans provided either by the employees or by the company, and will sell them to employees on terms of rent, with interest on deferred payments at only 6%. It has not been the policy of the companies operating in the Warren district to build houses for rent but rather to provide means whereby employees may own their own homes, and acquire them without trouble. In the past this has been provided by the Cochise Building & Loan Association, which has a liberal policy and is responsible for the building of over 300 houses at Warren, the residence area of the Bisbee-Warren district. The new plan provides for loans to employees only, and does not necessitate that they have a large amount of money to make the preliminary investment and the purchase of the lot.

Clifton.—The fire in the Coronado mine of the Arizona Copper Co. still burns. The area was bulkheaded, but one of the bulkheads was blown-out by gas recently, killing a shift-boss and two men.

Globe.—The Iron Cap company pays a dividend of 25c. per common share on September 2.

The Superior & Boston Copper Co. has made an assessment of 50c. per share, on 297,827 shares. The 1000-ft. level of the Telfair claim is reported to show an improvement.

Prescott.—The Senator-Groom Creek district, 6 to 15 miles south of Prescott, is worthy of investigation, according to 'Yavapai' of July. Many of the gold mines have been idle for years. The Midnight Test was re-opened in 1916, but has been closed again. Other idle properties of merit are the Home Run, Empire, Gold Basin, Monte Cristo,

Silver King, Sunnyside, Gold Warrior, Ratcliffe, Dunkirk, Lookout, Bodie, Crook, Mount Union, and others. Most of these have mining and milling plants of some kind, and are said to have good possibilities. One of the troubles is the complex character of the ore. The Big Pine is treating 100 tons daily. Some work is being done on the Senator, Tillie Starbuck, Venezia, Blackstone, and others.

Ray.—The Ray Hercules mill is expected to be at work this month.

Ray Consolidated is sinking ten 100-ft. wells in the bed of the Gila river to add to its mill water-supply at Hayden. Air-lifts will be used for pumping.

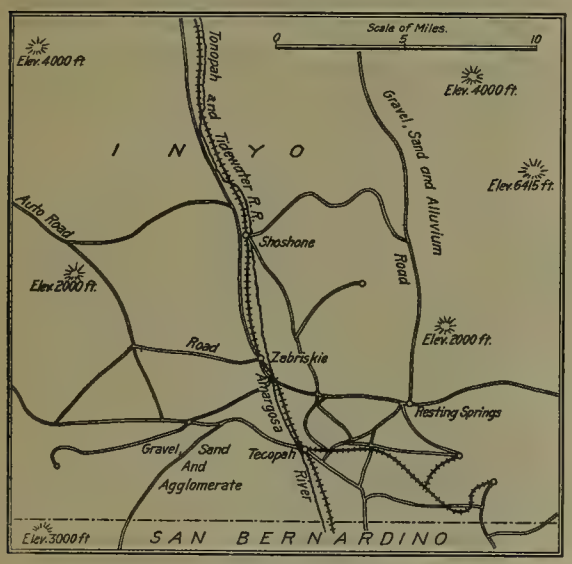
CALIFORNIA

Death Valley.—According to W. B. Hitchman, of the Tonopah & Tidewater Railroad, three of the largest talc mines in this country are shipping ore from Acme and Riggs. A new station named Talc has been opened.

Lamoine.—The Copper King mine in Trinity county has turned out to be a fairly good chrome property. Twenty-five tons daily is being hauled to Gibson, the next station above Lamoine. G. R. Bland is the managing owner.

Talus.—The California Sulphur Co. is to erect two retorts here, capable of distilling 30 tons of ore daily from its deposits near Coso Springs, in Inyo county. O. B. Bacham of Los Angeles is vice-president.

Zabriskie.—In December 1917 the Secretary of the Interior was informed that large deposits of nitrate of soda



THE NITRATE DEPOSITS DESCRIBED IN ACCOMPANYING REPORT ARE IN THIS DISTRICT.

had been discovered in Amargosa valley, in Inyo county. As these deposits were said to be large and rich enough to relieve the United States of the necessity of importing from Chile the sodium nitrate required for making munitions and fertilizers, and as the need of using all available shipping for other war work was urgent, the Secretary at once called upon the Geological Survey to examine the deposits. Four geologists were accordingly sent from Washington to make the examination, and on reaching California the party was increased by the addition of another geologist and 10 other men, most of them experienced miners. The deposit was said to be in the valley of Amargosa river, 2½ miles west of Tecopa and 3½ miles south-west of Zabriskie, near the Tonopah & Tidewater railroad. The Survey had already been systematically exploring other well-known nitrate deposits along Amargosa river above Death valley, among them those called the Upper canyon, Lower canyon, and Saratoga deposits. The results of these explorations indicated that the sodium nitrate in these deposits was small, but the reports as to their character and extent were conflicting, and it was therefore decided to determine conclusively their value.

The Amargosa district includes 11 so-called nitrate fields, all in or near the valley of Amargosa river—the Zabriskie field, in which the newly-found deposit was reported to lie, and the Resting Springs, Tule Springs, Upper Canyon, Lower Canyon (Sperry), Salt Springs, Saratoga, Round Mountain, Valley, Confidence, and Owl Springs fields. The exploring party eliminated the deposits in the Salt Springs, Tule Springs, and Resting Springs as probable sources of nitrate by preliminary tests, and sampled in some detail the deposits in the Saratoga, Confidence, Zabriskie, Upper Canyon, and Lower Canyon fields. They did not study the remaining fields in detail, for reconnaissance examinations and tests had indicated that the deposits in them were not different from those in the fields examined. The examination covered from December 26, 1917, to April 4, 1918 Numerous preliminary chemical tests were made in each field to determine favorable places for exploration. Scores of trenches were then dug down to and into the bedrock to determine whether any of the beds were especially rich in nitrate. Then many hundreds of pits were dug, each deep enough to penetrate the upper part of the bedrock. Samples were taken systematically from the trenches and pits, each sample was weighed, and most of the samples were ground, mixed, and divided to form representative samples weighing a pound each. Preliminary chemical tests of more than a thousand samples showed that many of the deposits were of no commercial value.

The results of the work may be briefly summarized as follows: In all, 78 trenches were dug, which had a total length of 3700 ft. and an average depth of 2 ft. 11 in.; 959 pits were dug to an average depth of 1 ft. 7 in.; 1085 samples were taken, from which 930 analyses were made. In the so-called Upper Canyon field, at Acme siding, 98 acres is estimated to contain 1480 short tons of sodium nitrate, but an overburden of about 100,000 tons would have to be removed in order to extract the caliche containing this nitrate. In the so-called Lower Canyon field 70 acres is estimated to contain 510 tons of sodium nitrate, the recovery of which would involve the removal of an overburden of about 50,000 tons. These two tracts are the largest and best of the ground examined, and, taken together, include 168 acres, which, if workable, might yield 1980 short tons of sodium nitrate, the recovery of which would involve the removal of 150,000 tons of overburden. The results of examinations at other places do not justify estimates of tonnage of nitrate.

The Survey's explorations have led to the following conclusions: (1) The nitrate in the Amargosa district occurs in a blanket of so-called 'caliche' about 5 in. in average thickness, lying about 9 in. below the surface of the ground. The nitrate is accompanied by other salts, chiefly sodium chloride. (2) The soil above and the bedrock below the deposits contain insignificant amounts of nitrate. (3) The high dip and the great thickness of the strata covered by the prospecting make it improbable that deeper beds of nitrate occur in this region. (4) The caliche in general contains an average of less than 2.5% of sodium nitrate, the areal distribution of which is uneven. (5) The Zabriskie field, in which the newly-found deposit was reported to lie, contains no commercially valuable nitrate. (6) The Upper Canyon and Lower Canyon fields, the most promising in the Amargosa district, together contain, according to careful estimate, about 168 acres of nitre-bearing deposits, which, if worked regardless of cost, might produce about

1980 short tons of refined nitrate. (7) The quantity of nitrate available in the Amargosa district is so small and the cost of production would be so great that the district as a whole cannot be regarded as a source of commercial nitrate. (8) No further work on the areas already examined is justified, except, perhaps, as purely scientific research. (9) The occurrence of caliche nitrate deposits in the Amargosa district, rather than the usual cave or disseminated deposits, makes it seem possible, though improbable, that really valuable deposits of nitrate may occur elsewhere in the same general region. (10) Prospecting should be continued until all similar deposits in other districts have been tested sufficiently to determine their value.

COLORADO

Central City.—On the 700-ft. level of the Gilpin-Eureka mine there is 10 ft. of good concentrating ore. G. W. Platt is to recommend erection of a flotation plant. Present recoveries are 65%. The amalgamating plates are to be altered. The main shaft is to be deepened 200 feet.

Jamestown.—Four mills are now available here for concentrating the low-grade fluorspar rock.

Leadville.—At the Jason property on Poverty flats, J. A. Clarke is to re-open and equip the old Neptune shaft. From this it will be possible to exploit the manganese ore being worked from the Jason shaft. The daily output is 40 tons of 27 to 35% ore.

The Doty Manganese Co. is being financed in order to operate on a larger scale.

The Hibschle mine is producing some rich lead ore, also some manganese-silver ore.

Montrose.—The Radium Ore Sampling Co. announces that it has completed a $12,000 rare-ore custom-sampler here, and that it is prepared to sample all kinds of rare and precious ores and concentrates. Particular attention has been given to making accurate moisture determinations, and to the collection, saving, and sampling of valuable carnotite dust and other ores. This company is composed of 25 of the leading business-men of Montrose. The company are not assayers, purchasers, brokers, or in any way dealers in ores or their products.

Silverton.—Ore and concentrate shipments from this district in July totaled 240 carloads.

IDAHO

Kellogg.—The Caledonia Mining Co. made a profit of $368,068 during the first half of 1918. The excess of assets over liabilities is $616,980. Dividends paid during the period were $468,900. The output was 10,511 tons of ore assaying 16.26% lead, 37.01 oz. silver, and 0.3% copper. Mining cost $7.40 per ton. The president, Stanly A. Easton, states that the present output will not continue more than three or four months. Present dividends are to be maintained, partly from earnings and partly from the large surplus.

Mullan.—The Federal M. & S. Co. made a profit of $90,178 in June, compared with $276,533 in June of last year.

Orogrande.—The Orogrande Gold Mining Co.'s trial mill runs were 1700 tons of $2, 2697 tons of $2.03, and 2939 tons of $1.93 gold ore. This was mined by open-cut methods. By selective mining an average of $3 or $4 per ton could be secured. A profit of about $1 per ton is expected from $2, when milling 400 tons per day. Amalgamation is in use. William Hogan is superintendent and H. E. Hewitt, metallurgist.

Sandpoint.—The Falls Creek mine, three miles east of Pend Oreille lake, has started its 50-ton mill. It cost $50,000 to put the property on a producing basis.

Wallace.—Tamarack & Custer pays 6c. per share on August 27. This is equal to $106,575.

MICHIGAN

Houghton.—Owing to the increase in freight rates, applying to ore as well as to other commodities, the Franklin mine has been closed.

The Ahmeek company has re-opened No. 3 shaft, which has been closed for a month on account of the fire. No. 4 will be kept closed for some time yet.

Wolverine reports as follows for the year ended June 30, 1918, compared with previous years:

	1917-'18	1916-'17	1915-'16	1914-'15
Ore dressed, tons	303,498	353,845	388,898	391,614
Yield per ton, pounds	15.185	16.600	17.070	18.230
Total copper, pounds	4,608,865	5,856,889	6,541,492	7,250,866
Cost per ton	$1.914	$1.630	$1.390	$1.200
Cost per pound, cents	18.927	11.540	9.430	8.430

Wolverine made a profit of $241,920 during the year ended June 30, 1918, compared with $1,026,405 in 1917, $735,218 in 1916, and $318,201 in 1915.

Copper Range pays $1.50 per share on September 14. This makes $4.50 for the current year.

MISSOURI

Joplin.—Production of the region last week was 7627 tons of blende, 224 tons of calamine, and 934 tons of lead. These averaged $51, $34, and $100 per ton, respectively. The value was $495,908, to which Missouri contributed $100,509.

MONTANA

Butte.—During July, Butte & Superior produced concentrate containing 5750 tons of zinc, and 225,000 oz. of silver. The recovery was 90%.

Helena.—A new shaft at the Scratch Gravel mine is reported to have cut a vein of rich gold ore at a depth of 21 ft. Three carloads are valued at $18,000. Water is hampering sinking operations. T. B. Miller is resident director.

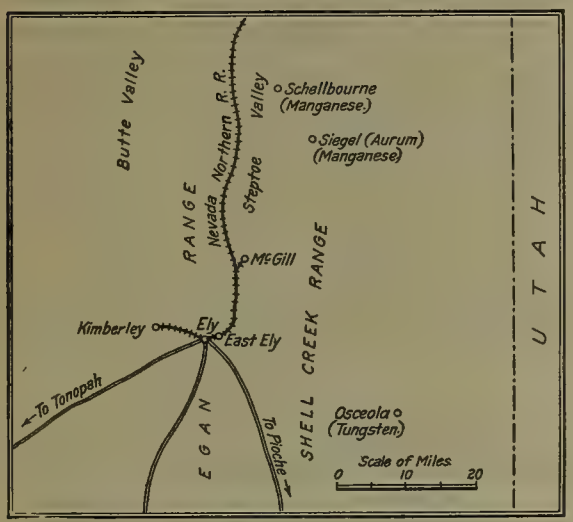
NEVADA

Belmont.—The Monitor Belmont mine, flooded since 1878, has been purchased by the Nevada Wonder Mining Co. The workings will be unwatered when new equipment is erected. Jay A. Carpenter will be in direct charge of the work.

Ely.—Consolidated Coppermines Co. produced 7,702,470 lb. of copper, 150,647 lb. of lead, 29,188 lb. of zinc, 8917 oz. of silver, and 137 tons of manganese during the first half of 1918. Churn-drilling has been suspended.

An examination of the deposits of manganese ore in White Pine county, in the Ely (or Robinson) district and the Siegel (or Schellbourne or Aurum) district, was made by J. T. Pardee, of the U. S. Geological Survey, early in June of this year. His reconnaissance covered an area 50 miles long from north and south and 20 miles wide, comprising part of Steptoe valley and the mountains that border it on the east and west. The Siegel district lies in a high and rugged area. The manganese ore extends from the surface to a depth of 50 ft. or more. Practically all the deposits occur in limestone and are associated with bodies of jaspery quartz. The manganese minerals have replaced both the wall-rock and the quartz. The orebodies are irregular pipes, pickets, and lenses, which range from a few feet to 70 ft.. or more in length, and from a few inches to 10 or 20 ft. in width. Several of the larger bodies contain from 500 to 1000 tons or more. Water-level has been reached only in the Siegel mine, where it stands 200 ft. below the surface. The bulk of the ore is composed of the softer manganese oxides, pyrolusite being predominant in some mines and wad in others. The wad is generally rather compact and tough and can be whittled like wax. Philomelane and manganite, though rather widespread, occur in subordinate amount. Fairly large masses of a very hard compact black manganese oxide, tentatively regarded as braunite, are found in the Bowen and Holmquist mine. The ore below water-level in the Siegel mine is composed of rhodonite, rhodo-

chrosite, and alabanite. Jaspery quartz, calcite, and iron oxides are generally associated with the manganese minerals. In the Siegel mine, cerusite and massicot were observed above water-level and galena and pyrite below. Most of the ores contain some silver. The ore mined contains from 36 to 45% manganese, 3 to 16% silica, 3 to 5% iron, a moderate amount of lime, and very little phosphorus. Parts of the orebodies not now mined or rejected in sorting ore for shipment contains more than 16% silica. Ore containing 25 to 30% of manganese and 15% or more of iron occurs in several places. A total output of 2108 short tons of 40% manganese ore was produced by seven operators up to June 1, 1918, the first shipments having been made late in 1917. In addition, 1200 tons was produced by the Siegel mine from 1902 to 1908, but this ore, though high in manganese, was smelted for silver and lead, the manganese being lost in the slag. About 550 tons per month is now being shipped from the Ely and Nevada districts. Additional



THE MANGANESE DEPOSITS OF WHITE PINE COUNTY ARE SHOWN IN THIS SKETCH.

equipment now being installed by one of the operators is expected to increase the production by 100 tons per month, and if the Siegel mine becomes active it will produce an additional 250 tons, so that the total monthly output will be 900 tons. Most of the orebodies are near the surface, and can be mined by open pits or shallow shafts and tunnels. Water usually has to be hauled and mine timber, machinery, and general supplies are said to be rather expensive and difficult to obtain. Wages are $5 per day and miners are said to be fairly numerous and to prefer employment with the manganese or other small mines rather than with larger corporations. Board is $1.25 per day. The cost of hauling the ore from the Ely district to the railway, a distance of 2 or 3 miles, is about $2 per ton. The cost of hauling by motor-truck from the Nevada district to East Ely, a distance of 10 miles, is about $4. The distance from the Siegel district to the railroad is 30 miles by one and 40 miles by the other of the two most available roads. Estimates as to the probable cost of transportation from this district to the railroads range from $6 to $10 per ton. The high-grade manganese ore (40% manganese and low silica) now in sight is estimated at 5450 tons; the ore containing 15 to 40% manganese and high silica, at 5000 to 12,000 tons; the ore containing 15 to 40% manganese and high iron, at 1650 to 4000 tons; and the sulphide and silicate ore carrying 20 to 35% manganese and 20 to 37% silica at 1000 to 3000 tons.

Eureka.—According to the Eureka 'Sentinel' the Eureka-Nevada railway has been asked to haul 900 tons of ore monthly from Mineral station to Palisade. The request was made by the U. S. Smelting Co., the ore to be supplied from the mines at Mineral Hill for the company's smelter at Kennett, California. The railway is unable to handle this tonnage with its present equipment, but has offered to take over 600 tons.

Tonopah.—During the first half of 1918 the Jim Butler company received $294,354 for ore shipped to the Belmont mill, $169,528 being profit. Cash resources on June 30 totaled $266,266, including $100,000 for Liberty Bonds. The interest of this company in the Belmont Shawmut (California) and Belmont Wagner (Colorado) companies is $328,036.

NEW JERSEY

Franklin Furnace.—The New Jersey Zinc Co. reports that in the second quarter of 1918 its net income was $3,697,644, of which $2,800,000 was paid in dividends. The profit is almost similar, but dividends are double those of the March quarter.

NEW MEXICO

Magdalena.—The Calumet New Mexico Mining Co. has under construction a new concentrating plant to dress its complex lead-zinc-gold-silver-copper ores. This will be a modern mill in every respect, so arranged that the flow-sheet can be changed in many ways to ensure the best treatment of the different ores. Equipment includes a Blake crusher, rolls, ball-mill, impact-screens, sand and slime tables, and flotation apparatus. The entire plant was purchased from the Colorado Iron Works Co. The capacity of the first unit will be 50 to 100 tons per 24 hours, depending on treatment necessary. Excavation and foundation are finished, and a good part of the frame-work is already erected. The start of milling will depend on delivery of machinery.

The Mammoth Mining & Milling Co. has its mill at Pinos Altos ready for the belts. Its operations are based on a gold-silver-copper ore of $16 value.

Mogollon.—The Socorro M. & M. Co. started its new 250-ton mill at full capacity on August 1. The new arrangement has reduced power consumption by 75 hp. on the same tonnage; also employs several men less per shift.

A new vein carrying high-grade silver-gold-copper ore was recently cut in the Johnson mine of the Socorro company. The vein is 4 to 5 ft. wide, and has been opened over 60 ft. Connections are being made to cut this from No. 1 shaft.

The Oaks company is sinking the Central shaft on the Deep Down mine.

OKLAHOMA

Picher.—Production of the district last week was 6777 tons of blende and 755 tons of lead, valued at $373,019.

OREGON

Baker.—The Highland mine, 14 miles from Haines, has been sold by F. R. Mellis of Baker to Flanagan, Quinn & Darcy of Tacoma, Washington, representing the National Mines Co. John Thomas of Portland made the examination and will act as supervising engineer. The property has been worked intermittently since 1891. From June 1912 to April 1914 the new mill yielded 4750 tons of silver-lead-zinc concentrate, which sold for $226,205. Financial troubles led to a suspension of work in May 1914. A sheriff's sale was held in August 1915. The mine has yielded $305,000 to date. A flotation plant is to be added to the mill.

UTAH

Alta.—The South Hecla company shipped over 1500 tons of ore during July, while lessees mined 400 tons. This was valued at $20 per ton. About 75% is copper-silver sulphide, the remainder silver-lead carbonate.

At the Albion, water has retarded progress in the tunnel.

The Alta-Michigan shipped 250 tons of $15 copper-silver ore, and South Hecla Extension 140 tons.

Bingham.—It is reported that the Utah Consolidated has purchased the Yampa mine, part of which is in dispute between this company and the owners of the Yampa.

Gold Hill.—Wages for miners in the Deep Creek district are $5 for miners, timber-men, and engine-men, $5.50 for shaft-men and blacksmiths, $4.75 for shovelers, and $4.75 for teamsters. Board costs $1.25 per day.

The daily tram from Gold Hill and Wendover may be resumed, according to the 'Gold Hill Standard.'

The Western Utah Copper Co. is to equip its Yellowhammer mine at an early date.

The Western Utah Extension is doing considerable work in its Mogul and Helmet mine.

Lessees at several claims are reported to be shipping good ore.

Indications at 336 ft. in the Pole Star are encouraging.

Park City.—The American Flag Mining Co. has debts totaling $211,750, and is in the hands of a receiver.

Tintic.—Miners in the new shaft of the Chief Consolidated at Eureka have stopped work until they get $7 per shift. The contractor, Walter Fitch, Jr., was paying $6.50, which was 75c. more than the shaft wage would actually be if 50c. was added to the regular miner's wage of $5.25. When the men quit at the new shaft the contractor promptly replaced them with other miners. Work was progressing satisfactorily when the matter was taken up at a meeting of the Tintic District Miners Union, which passed a resolution fixing the daily wage for shaft work in the Tintic district at $7, which is $1.75 more per day than the regular wages paid miners in Utah districts. Following this action of the Union the contractor stopped sinking, and it is quite evident that an effort to enforce this new scale will result in the suspension of all shaft work in this district, as there is not a mining company or a contractor who will pay such wages.

WASHINGTON

Valley.—The Northwest Magnesite Co. produced 4000 tons of calcined magnesite during July. Four kilns are at work, and two more are being built. A 250-hp. oil engine and generator—second-hand—are being erected. Roy Bishop is manager.

MEXICO

Mexico City.—A Consular Report dated July 23 states that Circular No. 6, issued by the Department of Industry, Commerce, and Labor, under date of July 6, relative to permits which in future will be granted for the sinking of oil-wells, provides that inasmuch as many persons and companies to whom permits have been issued for sinking oil-wells have not begun work thereon or have not finished drilling within a reasonable length of time, it has been decided that in future such permits will be considered as subject to cancellation in case work has not been started within six months from the date of the provisional permit granted by the respective agency, and in case work has not been completed within one year from the same date. A period of 90 days is stipulated within which to re-validate any permits that may come under either of the two cases described, this period to begin from the date of the circular. Any permits that may be canceled for any of the reasons stated may be re-validated upon application to the respective agency, which will establish the conditions under which such permits may be renewed.

Mazatlan.—According to J. M. Beach, formerly of Nevada, just returned to San Francisco from a trip along the west coast of Mexico, where he examined several properties for Americans, there are practically no mining operations going on there now. One reason for this is that there is no medium of exchange.

PERSONAL

Note. The Editor invites members of the profession to send particulars of their work and appointments. This information is interesting to our readers.

C. W. Hosmer has joined the Army and is in France.

C. C. Larson, of Minden, Nevada, is at the Stewart hotel.

Lawrence Addicks has returned from Burma to New York.

Bond Coleman has gone from Ojuela, Mexico, to El Paso, Texas.

John F. Cowan, from Utah, was in San Francisco on August 19.

William E. Defty, of Phoenix, Arizona, is at the St. Francis hotel.

S. W. Scarfe, of Nevada City, California, is at the Whitcomb hotel.

Daniel C. Jackling has returned to San Francisco from Washington.

Algernon Del Mar has returned to Los Angeles from Nelson, Nevada.

R. R. Goodrich has gone to Moscow, Idaho, from Anaconda, Montana.

J. A. Willey has returned to the United States from Nicaragua, Central America.

Myron A. Folsom, who has been at Washington, has returned to San Francisco.

J. W. Sherwin, superintendent of the West End mine, Tonopah, was here last week.

J. W. Doty, general manager for the Foundation Construction Co. of New York, is here.

F. H. Probert has returned to Berkeley from Washington and will proceed shortly to Colorado.

Philip Argall has returned to Denver from Cleveland, after a short holiday on the Great Lakes.

C. W. Purington is expected in San Francisco early in September on his way from London to Siberia.

Albert H. Fay, statistician to the U. S. Bureau of Mines, was here collecting data on industrial insurance.

Howland Bancroft has returned to Denver after having spent the past seven weeks in Washington on war work.

George E. Farish, who is re-opening the Devisadero mine in San Salvador, is sailing today on his return to the mine.

F. R. Roth, metallurgist at the smelter of the Burma Mines, has returned to San Francisco, to volunteer for military service.

F. W. Draper was in San Francisco at the end of last week, on his return to New York from inspecting mines in southern California.

John Seward has been assigned to the executive division of the General Staff, at Washington, with rank as major. He will specialize in war minerals.

R. G. Hall, general manager of the Herculaneum smelter, near St. Louis, has been appointed manager for the Burma Mines, Ltd., in Burma, succeeding **T. E. Mitchell.**

The whereabouts of **John Frank Bard**, who was at Salmon, Idaho, last year, and at Salt Lake City in January 1918, is desired by Edith Brown of 349 West 6th North street, Salt Lake City.

R. W. Derby, for seven years manager for the Powder River Gold Dredging Co. at Sumpter, Oregon, has resigned. **L. T. Roberts**, who has been dredge-master, has been named as Mr. Derby's successor.

G. H. Cox, of the department of geology of the University of Missouri, states that the School of Mines and Metallurgy at Rolla has signed its second contract for a Government training camp. At the present time 165 men are being given special instruction in electricity, gas engines, forge, machine-shop, and mining.

THE METAL MARKET

METAL PRICES

San Francisco, August 20

Aluminum-dust, large and small lots, cents per lb.	65—70
Antimony (wholesale), cents per pound	15
Copper, electrolytic, cents per pound, in carload lots	26.00
Copper, electrolytic, cents per pound, in small quantities	27.35
Lead, pig, cents per pound	8.30— 9.30
Platinum, Government price, per ounce	$105
Quicksilver, per flask of 75 lb.	$120
Spelter, cents per pound	11
Zinc-dust, cents per pound	17½

ORE PRICES

August 20

Antimony, 45% metal, f.o.b. California, per unit	$1.10
Chrome, 38 to 48%, California, per unit	$1.25—$1.50
Fluorspar, 85% CaF_2, f.o.b. shipping point, or San Francisco, per ton	$22—$30
Magnesite, crude, California, per ton (nominal price)	$7.00—8.00
Manganese, domestic, 35 to 54%, f.o.b. South Chicago, per unit (Government price, effective May 29)	$0.86—$1.30
Manganese, domestic, 35 to 45%, f.o.b. east of South Chicago, per unit (Government price, effective May 29)	$1.01—$1.45
(Manganese, domestic, penalty of 50c. to $1 per ton for 8% and up to 25% silica, and bonus of 50c. to $1 for less than 8 and 5%.)	
Molybdenite, per lb., 85% MoS_2	$1.00
Pyrite, per unit of sulphur, cents	28—32
Tungsten, 60% WO_3, California, per unit	$20—$24

'Chromite in 1917,' by J. S. Diller of the U. S. Geological Survey, has been issued. The domestic supply fell off 3310 tons in 1917 from the total of 47,035 tons in 1916. It is expected that the 1918 output will amount to 65,000 tons of all grades. A list is given of owners and operators of chrome mines in the United States.

EASTERN METAL MARKET

(By wire from New York)

August 20.—Copper is unchanged. Lead is scarce and firm. Spelter is strong and higher.

SILVER

Below are given official (not Government) quotations, in cents per ounce of silver 999 fine. In order to make prompt settlements with smelters and brokers, producers allow a discount from the Government price of $1, hence the lower price. The Government has not fixed the general market price at $1, but will pay this price (as from April 23, 1918) for all silver purchased by it. The equivalent of dollar silver (1000 fine) in British currency is 46.65 pence per ounce (925 fine), calculated at the current rate of exchange. On August 15, 1918, the Treasury announced that the maximum price was fixed at $1.01½ per ounce.

Date	New York, cents	London, pence
Aug. 14	99.62	48.81
" 15	99.62	48.81
" 16	99.62	48.81
" 17	99.62	48.81
" 18 Sunday		
" 19	101.50	48.81
" 20	101.50	48.81

Average week ending	
July 9	99.62
" 16	99.62
" 23	99.62
" 30	99.62
Aug. 6	99.62
" 13	99.62
" 20	100.25

Monthly averages

	1916	1917	1918		1916	1917	1918
Jan.	56.76	75.14	88.72	July	63.06	78.92	99.62
Feb.	56.74	77.54	85.79	Aug.	66.07	85.40	....
Mch.	57.89	74.13	88.11	Sept.	68.51	100.73	....

May	74.27	74.61	99.50	Nov.	71.60	85.97	....
June	65.04	76.44	99.50	Dec.	75.70	85.97	....

On August 15 the U. S. Treasury announced that it had virtually fixed the maximum price of silver at $1.01½ per fine ounce, and that export licenses for silver would be granted by the Federal Reserve Board only for essential civil or military purposes, also on condition that the maximum price was not exceeded by the purchaser. On the 19th the new price was officially quoted by dealers in the metal.

The Shanghai Exchange eased to 4s.8½d. ($1.13) per oz. late in July. It is reported from India that the monsoon was, up to that time, less favorable than usual, particularly in the Bombay province. There is still plenty of time for better conditions to prevail. India has had such a succession of good harvests that a poor monsoon would not be of such importance as it would otherwise have been. Incidentally, such an untoward event would tend to curb the demand for silver coins.

COPPER

On September 21, 1917, the Government fixed copper prices at 23.50c. per lb. for large lots, and 24.67½c. for small lots, effective until June 1, 1918. On this date the prices were re-fixed until August 15; but on July 2 the price was increased to 26c. and 27.35c., respectively, until August 15. On August 7 the current rates were again fixed until November 1, prices to be effective on the day of shipment, not the day of sale.

Quotations in cents per pound are as under:

ZINC

Zinc is quoted as spelter, standard Western brands, New York delivery, in cents per pound. On May 25, 1918, the Government fixed prices until September for grade A spelter at 12c. per lb. for itself and the open market. Lower grades can make their own prices as usual. Sheet-zinc is fixed at 15c., and plate at 14c. per pound.

QUICKSILVER

The primary market for quicksilver is San Francisco, California being the largest producer. The price is fixed in the open market, according to quantity. The Government is taking 40% of the United States quicksilver output, paying therefor $105 per flask. Outside of this business the competitive market can make any price as usual. Prices, in dollars per flask of 75 pounds.

ORES (New York)

Ferro-manganese: There has been no decided response to the official appeal that consumers contract ahead as far and as soon as possible. The market is firm at $250 per ton for 70% alloy, plus $4 per unit above this.

Tungsten: There has been fair activity and some sales at the ruling quotations of $20 to $24 and $24.50 per unit, the better grades going at the higher prices. Ferro-tungsten is quoted at $2.30 to $2.40 per lb. of contained tungsten.

Eastern Metal Market

New York, August 14.

Practically all the markets continue to be quiet and devoid of special interest, possibly with the exception of copper. This metal is active, after the announcement of a continuance to November 1 of the present fixed price of 26c. per pound.

Tin is still scarce and unchanged.

Lead is no more plentiful, but is maintained at a fixed price-level.

Zinc is fairly firm, because of a little more interest shown by consumers.

Antimony is practically unchanged.

Aluminum has a fixed Government maximum level.

The pig-iron output in July, according to the blast-furnace reports of the 'Iron Age', totaled 3,420,988 tons, or next to the largest this year. May holds the record of 3,446,412 tons. The daily output in July was 110,354 tons, which compares with 110,793 in June, and 111,175 tons in May, showing that it is not an easy matter to increase the output. Furnaces in blast on August 1 totaled 364, a net gain of 8 for July, the estimated daily capacity being 112,600 tons. July tin-plate production was 3,000,000 boxes, a good result. The most important event last week in the steel world was the award of the War Labor Board to the machinists of the Bethlehem Steel Co., involving an 8-hour day, collective bargaining, and the revision or discontinuance of the bonus system. Ship steel in process or in stock at shipyards and fabricating plants amounts to 1,000,000 tons. The War Industries Board seems confident that there will be no break in the shipbuilding program for lack of steel.

COPPER

It is difficult to say whether the expected or the unexpected happened at the meeting at Washington on August 7 to fix the price for copper. The new price took effect on August 15. The unexpected happened when it was raised on July 2 from 23.50 to 26c. per lb. On August 7 the price was continued at 26c. from August 15 to November 1 next. While many expected an advance to 27c., it now appears that there were many who did not look for a change, and they belong to the usual "I told you so" party. Anyhow there did not seem to be any decided dissatisfaction, but there is persistent talk that an adjustment upward on November 1 will be necessary, due to constantly advancing costs and other reasons. The heat both in the West and in the East, particularly, is not stimulating output. Around New York there has been over a week now of hot and humid weather. Many plants were forced to shut-down on August 7 because of the unprecedented temperature of 102° F. in the shade. This of course affected the copper refinery output, as over 90% of the country's copper is treated nearby. As a result of a settlement of the price for a definite period, there has been a big demand for the metal for delivery, to November 1 at 26c., and producers have been overwhelmed with inquiries and orders. Those desiring to buy beyond that date can only do so by contracting for the metal at the price ruling at the time of delivery. There is a rumor, unconfirmed, that the Price-Fixing Committee of the War Industries Board ruled that contracts made at the 23.50c. price, advanced automatically to 26c. in case shipment had not been made prior to the date the new price of 26c. went into effect, or prior to July 2. Jobbing lots, 5 tons and less, rule of the fixed maximum price of 27.35c. per pound.

TIN

The market continues quiet with consumers not anxious on the surface, and fewer showing little interest. They are awaiting probably the results of important deliberations in London, where a conference is to be held as soon as possible by a group of tin experts, including part of a special mission from the United States government. The two representatives of this country are John Hughes, chairman of the subcommittee on tin of the American Iron & Steel Institute, and George M. Armsby, chief of the tin section of the War Industries Board. They are to study the entire tin situation of the world, and it is expected that some arrangement will be made that will facilitate trading between America and England. Difficulties are now many and exasperating. Imports of the metal continue large. For the 11 months ended May 31, the receipts of tin in bars, blocks, pigs, etc., were 121,153,105 lb., of which 28,000,000 lb. came from the United Kingdom and 48,520,000 lb. from the Straits Settlements. For the 11 months ended May 31, 1916, or two years ago, the total was 123,956,905 lb., of which 35,000,000 lb. came from the United Kingdom and 73,000,000 lb. from the Straits Settlements. This shows the great change in sources. Still another instance, however, is the receipts from the Dutch East Indies. In the 1918 period these imports of Banca tin were nearly 22,000,000 lb., contrasted with 10,000,000 lb. in the 11-month period of 1916. The London market is lower, Straits tin on August 12 being quoted at £387 10s., compared with £394 10s. per ton the week before.

According to the market report of Henry R. Merton & Co. of London, dated July 20, arrangements have been made by the British authorities controlling supplies and prices of tin, that in future offers will be regulated in such a way that the offers to America will be more on equality with the prices ruling for the United Kingdom.

LEAD

The feature of this market continues to be the scarcity of the metal. Government needs come first, and when those are taken care of there seems but little left for other purposes. Production is large, but not at present equal to the demand. There are evidences of some speculation, certain brokers having small stocks being able, it is said, to part with them at prices above the agreed maximum average among producers, which continues to be 7.75c., St. Louis, or 8.05c., New York. Such speculative lots have gone as high as 8.75c. per lb. New York for spot delivery, an instance of one car at this price being noted.

ZINC

The tone of the market is a little stronger than a week ago, but the change is not of much consequence. The Government is buying again, 3000 tons having been purchased in the last few days. There is a little more inquiry. Prime Western for August-September delivery is quoted at 8.12½ to 8.25c., St. Louis, or 8.37½ to 8.50c., New York. Grade A spelter is fixed at 12c. per lb. as a maximum Government price. Sheet-zinc is regulated at 15c. per lb. with plate-zinc at 14c. per lb., both maximum prices.

ANTIMONY

Quietness continues to characterize this market. Quotations are unchanged at 13 to 13.25c. per lb., duty paid, New York, for prompt and early delivery of Chinese and Japanese grades, the only metal available.

ALUMINUM

Government maximum prices govern this market. No. 1 virgin metal 98 to 99% pure, and also scrap, in 50-ton lots are held at 33c. per lb., in 15 to 50-ton lots at 33.10c. per lb. and in 1 to 15 tons at 33.20c. per pound.

Company Reports

Reports of the silver mines at Tonopah, Nevada, are as follows:

TONOPAH BELMONT DEVELOPMENT CO.

Property: silver mine and mills at Tonopah, Nevada; also controls the Belmont Surf Inlet Mines, Ltd., in British Columbia, Belmont Shawmut Mining Co. in California, and Belmont Wagner Mining Co. in Colorado.

Operating Officials: (at Tonopah) Frederick Bradshaw, general manager; T. F. M. Fitzgerald, mine superintendent; L. R. Robins, mining engineer; G. H. Garrey, consulting geologist; A. H. Jones, superintendent of milling; W. H. Royston, mill superintendent; and Temple Jackson, auditor.

Financial Statement: this covers the period ended February 28, 1918, and may be compared with previous years as under:

	1917-'18	1916-'17	1915-'16	1914-'15
Gross value of ore	$2,171,521	$2,531,737	$2,332,253	$3,037,435
Loss in treatment	123,017	165,746	171,730	231,066
Value realized	$2,048,504	$2,365,991	$2,160,523	$2,806,369
Operating expense	1,097,802	1,112,349	1,170,107	1,304,379
Net profit, including other income, less taxes, etc.	$1,018,125	$1,245,100	$1,001,028	$1,456,698

Current assets total $966,790, and liabilities $292,268, including $105,656 for taxes due. Investments, in subsidiaries, total $1,913,214. A large part of the surplus assets have been converted into the capital stocks of new companies organized to take over and operate properties under option agreements. To the end of the financial year $1,291,410 had been spent on the Surf Inlet mine.

Dividends: in 1917-'18 amounted to $750,018, making a total of $9,518,063 since 1906.

Development: at Tonopah, new work completed amounted to 14,437 ft., 25% less than in 1916-'17. This did not add to the reserves, which are estimated at 75,823 tons.

Treatment Plants: the Tonopah mill treated Belmont ore only for 9 months, after which it received ore from the Jim Butler and Tonopah companies, on a custom basis. Each lot of ore is crushed, weighed, and sampled separately before being distributed to the battery bins, the system being entirely satisfactory. The plant for treating sweepings from tailing ponds worked from April to December—the season. The mill at Millers worked until December as a custom plant, after which it was shut-down and partly dismantled. During 11 years it treated 568,345 tons of ore valued at $11,989,513.

Production: from the company's mine this was as follows, compared with previous years:

	1917-'18	1916-'17	1915-'16	1914-'15
Ore treated, tons	131,100	144,762	165,157	181,424
Value per ton	$16.57	$17.45	$14.13	$16.74
Extraction, per cent	94.05	93.35	92.97	92.99
Gold, ounces	19,953	27,831	31,112	40,591
Silver, ounces	1,946,757	2,629,466	2,968,565	3,714,862
Silver av. per ounce, cents.	84.13	69.30	51.76	55.16

Costs: these were as follows for the last four years:

	1917-'18	1916-17	1915-'16	1914-'15
Mining	$4.439	$4.179	$3.800	$4.020
Treatment	3.204	2.897	2.699	2.560
General	0.826	0.678	0.683	.....
Total net	$8.381	$7.670	$7.093	$7.190

TONOPAH EXTENSION MINING CO.

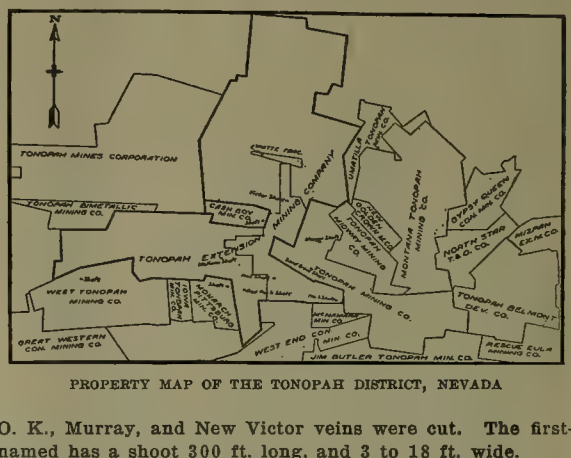
Property: silver mine and mill at Tonopah, Nevada.

Operating Official: J. G. Kirchen, general manager.

Financial Statement: during the year ended March 31, 1918, sales of silver and gold realized $1,250,983. After paying all accounts there remained a profit of $230,332, compared with $673,394 in 1916-'17.

Dividends: none was paid, the total remaining at $1,912,-399.

Development: at No. 2 shaft 3910 ft. of work was done, and 7067 ft. at the Victor. Operations at 660, 850, and 950-ft. levels of the former shaft consisted of stoping on the Murray vein, where a small quantity of ore remains. At 1170 ft. the Murray and Merger produced poor ore. At 1260 ft. the No. 2 Merger Footwall vein yielded the best ore during the year. At 1350 ft. the Murray and O. K. veins are worked out. At 1440 ft. the Murray supplied a large quantity of average-grade ore, so did the Merger and O. K. Indications on this level are good. At the Victor shaft, 1759 ft. deep, the Murray at 1540 ft. was stoped out. An intermediate level has exposed a good shoot. Pumps are to be placed at 1680 ft. in the shaft. On this level the Merger,



PROPERTY MAP OF THE TONOPAH DISTRICT, NEVADA

O. K., Murray, and New Victor veins were cut. The first-named has a shoot 300 ft. long, and 3 to 18 ft. wide.

Production: a comparison of previous years shows:

	1917-'18	1916-'17	1915-'16	1914-'15
Ore treated, tons	110,188	109,402	91,981	71,882
Value per ton	$12.543	$17.107	$18.038	$19.966
Extraction, per cent	90.51	.....	92.39	89.57
Silver, ounces	1,169,671	1,882,402	2,106,519	1,790,032
Gold, ounces	11,809	18,052	20,576	17,585
Costs per ton	$8.64	$8.82	$9.59	$9 39

TONOPAH MINING CO.

Property: silver mines at Tonopah and mill at Millers, Nevada.

Operating Official: W. H. Blackburn, superintendent.

Development: three main shafts were operated during 1917. All work is done on day shift only. A new shoot was discovered between the 1400 and 1000-ft. levels on the upper Sand Grass vein. In mining old pillars, or in cleaning out old stopes, small orebodies are found. No estimate of reserves is possible. Ore-house rejects, up to 5635 tons, assaying $5.78 per ton, were treated profitably in a month.

Production: a comparison shows the following:

	1917	1916	1915	1914
Ore treated, tons	109,835	*81,782	136,246	143,422
Value per ton	$14.80	$15.65	$13.66	$16.25
Extraction, per cent	91.9	90.1	.....	.....
Silver, ounces	1,443,368	.....	.....	.....
Gold, ounces	16,929	.....	.....	.....
Cost per ton	$9.159	$8.71	$7.78	$8.51

*9 months only.

Subsidiaries: the three dredges of the Tonopah Placers Co. at Breckenridge, Colorado, worked nine months.

At the Eden Mining Co.'s property in Nicaragua, the mill was closed on account of power shortage. There will soon be 1400 hp. available. Costs have risen so much that the ore must be of 50% higher value than before the War.

At the Tonopah Nicaragua property, in Nicaragua, drilling will be completed about the middle of 1918.

The Mandy Mining Co. in Manitoba, Canada, produced 8500 tons of ore during the past winter. This was sent to smelters when navigation opened. From December 1916 to June 1917 there was shipped 3335 tons of ore containing

1,113,935 lb. of copper (equal to 17%), 337 oz. of gold, and 7560 oz. of silver. This was worth $231,730. The net result was a loss of $11,413.

The Tonopah Canadian Mines Co. and Brutus Mining Co. may be wound up if the properties fail to develop better.

WEST END CONSOLIDATED MINING CO.

Property: silver mines and mill at Tonopah, Nevada.

Operating Officials: J. W. Sherwin, superintendent; F. C. Ninnis, mill superintendent.

Financial Statement: receipts in 1917 totaled $1,335,214, including $1,044,896 from ore reduction. The balance remaining after operations, mill rental, deposits in escrow for ore suit, ore purchased, and dividends had been paid for was $47,656. Current assets total $911,147, including cash and bullion $346,734, deposits in escrow for disputed (with Jim Butler company) ore $376,701, loans receivable $52,000, stores $80,116, and litigation appropriation $30,000. Liabilities total $572,377, inclusive of disputed ore and interest $376,701, and depreciation reserve $143,020.

Dividends: $89,424 was distributed.

Development: the Ohio shaft was sunk to 1212 ft., and 4923 ft. of lateral work was done from this and 2702 ft. from the West End shaft. In April a new vein was found on the Ohio 500-ft. level. Owing to its low angle of dip this ore has been opened by foot-wall cross-cuts and raises therefrom. Twenty have been put up, fifteen being in commercial ore, the remainder being second-class ore. Of the lateral work on this vein—1225 ft.—1010 ft. was in profitable ore, the remainder on second-class ore. Between April and December the orebody had yielded 11,837 tons valued at $250,000. Reserves consist of 10,333 tons of positive ore valued at $206,660, 35,905 tons of probable ore worth $1,015,633, and 61,111 tons of possible ore. But the vein is irregular, and estimates are difficult. The vein is in trachyte, a good ore-bearing formation at Tonopah.

Production: the mill and cyanide plant treated 45,910 tons of company ore, averaging $15.73 per ton. This contained 7161 oz. gold and 677,117 oz. silver, of which 94.56% and 92.67%, respectively, was extracted. The bullion was worth $1.055 per fine ounce. Custom ore treated amounted to 20,923 tons. The total bullion extracted was 12,854 oz. gold and 1,219,860 oz. silver. A number of improvements were made at the plant.

Costs, per ton:

	1917	1916
Mining	$3.34	$2.95
Development	1.87	1.43
Treatment	3.27	3.42

INTERNATIONAL NICKEL CO.

Property: through subsidiaries the company operates nickel-copper mines at Sudbury, reduction-works at Copper Cliff, Ontario, and a refinery in New Jersey. A new refinery has been erected in Ontario. The capital is $62,000,000, of which $50,747,200 is issued. There are now 12,824 shareholders, against 9252 a year ago.

Financial Statement: this covers the year ended March 31, 1918, and may be tabulated as under:

Net earnings of all properties	$15,791,485
Other income	390,016
Total	$16,181,501
Administration charges	610,024
Federal and State taxes	3,590,836
Plant depreciation and mineral exhaustion, etc.	1,850,654
Net profit	$10,129,988

Current assets total $17,638,387 and liabilities $7,630,017.

Dividends: preferred stock received four (No. 47 to 50) of 1½% each, amounting to $534,756; and common stock one (No. 33) of 6% and three (No. 34 to 36) of 4% each, totaling $7,530,228.

Mining Decisions

Percentage of Extraction—Evidence Necessary

Courts cannot take judicial notice of what percentage of mineral can be extracted from a particular class of ore, it being a matter of proof for each particular case. It has been held, however, that a court will take judicial knowledge of the fact that such extraction will not be 100%.

Dixon v. Southern Pacific Co. (Nevada), 172 Pacific, 368.

Mining Partnership—Limits of Duration

Mining partnerships exist between co-owners only when they actually engage in working the property. Before actual operations begin, and after actual operations cease, they are simply co-tenants, unless, of course, an ordinary partnership has been formed. A receivership may, however, be legally based on such co-tenancy.

Huston v. Cox (Kansas), 172 Pacific, 992.

Grant of Mineral Rights—Incidents

A grant or reservation of mineral under the surface carries with it, or reserves, the right to use so much of the surface as is reasonably necessary for mining such material. In the absence of a provision in the deed to the contrary, however, the owner of the mineral right must provide subjacent support, and protect the surface against subsidence.

Hammarstedt v. Bakeley (Iowa), 166 Northwestern, 729.

Oil-Well Drilling—Damages for Breach of Contract

When a land-owner breaks a contract with an oil-well driller for the drilling of a well to a certain depth and refuses to allow him to proceed, the measure of damages is properly stated as the cost of moving the rig and drilling machinery to the point of operation, setting them up and drilling to the point of interruption, together with reasonable compensation for the driller's services and loss of time.

Letcher v. Maloney (Oklahoma), 172 Pacific, 972.

Mine Promotion—Stock Option Construed

An option on mining shares, "to be taken and paid for in such sums and amounts as may be required in prosecution of the work of the development of the company's property," was only an option to purchase so much of the stock as was required to pay for development work, and ended when the mine became self-supporting.

Woldson v. Richmond Mining, Milling & Reduction Co. (Washington), 172 Pacific, 1162.

Annual Labor—Value of Improvements

The actual cost of labor and materials expended in the performance of annual labor on a mining claim is competent evidence to show the good faith of the parties doing the work, but is not conclusive upon the question of the value of the improvements. Where the actual cost was shown to have been $15 to $25 per foot, but the testimony supported the finding that work was actually worth $35 per foot, the finding of the trial court based on conflicting evidence will not be disturbed on appeal. A party owning six adjoining claims may apportion the value of the work done on any one of them for the benefit of all of them in any way he sees fit. The apportionment need not be uniform, and if he elects to apply all the work to a portion of the claims and forfeit the remainder, he may do so. Resumption of work on another group prior to adverse re-location will prevent forfeiture thereof.

McKirahan v. Gold King Mining Co. (South Dakota), 165 Northwestern, 542.

INDUSTRIAL PROGRESS

INFORMATION FURNISHED BY MANUFACTURERS

THE CINCH ANCHORING SYSTEM

The need of an adequate system of fastening ornamental and structural fixtures to concrete, cement, and other masonry was not met fully until the introduction of the Cinch system. A Cinch expansion-bolt consists of a conical-wedge male part of malleable iron either plain or threaded, and a lead-composition female part. The plain two-unit anchorage consists of two of each of the above parts, neither of which is threaded, while for a threaded two-unit anchorage one of the iron parts is threaded. There are three kinds

FIG. 1 AND 2. PLACING AND CAULKING UNITS.

of Cinch anchorage specialties—the Cinch expansion-bolt, Cinch anchor, and Cinch stud-anchor—all of which are combinations of the units above described, together with either a standard machine-bolt or a stud-bolt. Since these anchorages are made of malleable-iron and lead-composition units, a complete cylindrical surface-contact is made with the walls of the hole, whether it be regular or irregular. Vibration will not loosen the hold since all parts are under complete restraint.

As shown in Fig. 1 the head of the bolt and the first unit are first placed in the hole. The unit is expanded by means of the caulking tool as shown in Fig. 2. Other units are added as required, each unit being expanded as it is put in place. After all have been expanded the piece to be hung is placed and the nut screwed on the bolt, an operation of but a few seconds. When it is desired to use a stud-bolt or to have the head of the bolt outside the work the same caulking method is employed. A threaded iron wedge is screwed upon the end of the stud-bolt and with the first alloy is placed in the hole. This is caulked in place and is followed by a plain iron wedge with its alloy, which is also caulked in place. The stud-bolt can now be unscrewed, leaving the expanded units in the hole. When ready to attach the work the bolt is engaged with the threaded wedge in the bottom of the hole. A plain piece of pipe can be used instead of the caulking tool if desired. These Cinch anchorages are carried in stock by Harron, Rickard & McCone, of San Francisco.

COMMERCIAL PARAGRAPHS

The Ducktown Sulphur, Copper & Iron Co., Copper Hill, Tennessee, is planning extensions to its works to increase the present capacity. These will include the erection of several new structures.

The Ontario Smelting Co., Ontario, Ohio, has increased its capital from $250,000 to $500,000 for extensions and improvements. The company is planning to erect an addition.

The Copper Exploration Co., Wilmington, Delaware, has been incorporated with a capital of $2,000,000 to operate copper properties. F. D. Buck and J. D. Frock, Wilmington, are the incorporators.

The Globe Smelting & Refining Co., Passaic, New Jersey, has been incorporated with a capital of $50,000 to operate a plant in that vicinity. Benjamin Friedman and Morris Lefferts, Passaic, are the incorporators.

The American Zinc, Lead & Smelting Co., 120 Broadway, New York, is said to be having plans prepared for its new smelting plant near Mascot, Tennessee. In connection with the smelter will be an electrolytic plant for zinc production.

The American Tin & Tungsten Co., 50 Broadway, New York, has secured additional operating capital and is planning for the immediate operation of its properties. This work will include the mining of ore and the operation of the existing milling plant.

The American Sheet & Tin Plate Co., Frick building, Pittsburgh, Pennsylvania, a subsidiary of the United States Steel Corporation, is having plans prepared for the construction o fa large addition to its works at Gary, Indiana, to cost in the neighborhood of $10,000,000. The buildings will consist of 24 tin-plate mills.

The Jonathan Bartley Crucible Co. advises us that on August 7 its No. 2 plant was partly destroyed by fire. All business that has been placed with the firm will be taken care of as usual, with practically no delay. New equipment has been ordered and repairs were commenced on August 12; the renewed works should be in operation by November 1.

535 WILFLEY TABLES
AT THE NEVADA CONSOLIDATED COPPER COMPANY

Many plants which have had the time and money to test out concentrating tables thoroughly have standardized with the Wilfley.

Several plants have more than 500 Wilfleys and use them exclusively.

One of these plants is the Nevada Consolidated Copper Co., with 535 Wilfley Tables.

Among these tables are 84 of our No. 9's—Double Deck Wilfleys—increasing capacity without increasing floor space, and maintaining highest metallurgical efficiency.

Other large concentrating plants have also followed through the same line of reasoning as the Nevada Consolidated Copper Co.

These plants, too, have arrived at the conclusion that Wilfley tables are the sure tables for **extraction** with great capacity and a minimum amount of operating attention.

Remember—the Wilfley was the pioneer concentrator—and is still the leader

Wilfley Table reputation extends around the world. The following orders have been received during the past few weeks:
64 Wilfley Tables, Burma Corporation, Ltd., Rangoon, Burma; 60 Wilfley Tables, Union Miniere du Haut Kantanga, Belgian Kongo

Crushers, Pulverizers, Clay Goods, Chemicals, Instruments, Etc. **Headquarters for Mine, Mill, and Smelter Equipment**

EDITORIAL

NOTES 271

GOLD AFTER THE WAR 272

Discrimination between 'price' and 'value' in discussing gold and currency; forthcoming gold convention at Spokane; co-operation with the American Gold Conference; what determines a premium on gold; safeguards taken against such a derangement of the market; effect of German demand for gold after the War. M. & S. P., August 31, 1918.

GOLD-DREDGING AND ELECTRIC POWER 273

Shortage of power in California, agreement of dredge-owners to curtail operations 33%; number of operating dredges, power consumed, and metallic output; reducing gold dredging curtails product of platinum; other means of limiting power consumption should be applied. M. & S. P., August 31, 1918.

NITRATE DEPOSITS 274

Problem of nitrogen fixation; no commercial deposits of nitrates in the United States; electrically fixed nitrogen will supersede the demand for Chilean nitrate; the bacterial theory for nitrogen fixation in nature; its limitations; theory of magmatic ammonia the more probable explanation. M. & S. P., August 31, 1918.

DISCUSSION

THE MARKET-VALUE OF GOLD

By W. de L. Benedict 275

Criticism of the resolutions adopted by the American Gold Conference; the 'price' of gold is not invariable; it depends on its purchasing power; on that basis the market-value of gold has decreased 50% for some commodities, and increased 20% for others; the invariable relation is that 20.6718+ times 23.22 gr. is 480 gr. or a Troy ounce. M. & S. P., August 31, 1918.

THE STATUS OF GOLD MINING

By S. Kawakami 275

The solution of the gold difficulty may be found in an international agreement to increase the price, or in giving a bonus to gold miners; the logical plan would seem to be for the Government to operate the gold mines. M. & S. P., August 31, 1918.

FORMULAS FOR MINE-VALUATION

By D. B. Morkill 276

Criticism of the Hoskold and Whitton formulas; a new formula suggested, based on the assumption that the investor, while drawing risk-rate interest on the invested capital, is entitled to security-rate interest on the portion that is to be returned. M. & S. P., August 31, 1918.

Page

FLOTATION AND OTHER TROUBLES IN MEXICO

By Bennett R. Bates 277

The Cubo company at Guanajuato, operating a 200-ton flotation plant, on ore averaging 350 gm. silver and 5 gm. gold; using table concentration, with K & K flotation machines and Hynes disc flotation apparatus; recovery is 95%; difficulties with acid water; undesirable to use water from thickeners. M. & S. P., August 31, 1918.

ARTICLES

THE GOLD PRODUCERS' HARVEST WILL COME WHEN THE WAR ENDS 279

Producers under no compulsion to sell their gold to the Mint; the Mint-price has nothing to do with the worth of gold; that is settled by the universal commodity-market; tendency to a premium in England, and gold has practically disappeared; gold in the national treasuries; the German demand for gold that will develop after the War; opportunity for profitable gold mining after the War. M. & S. P., August 31, 1918.

CHROMITE

By J. C. Williams 281

Production of chromite by countries; first discovery in the United States; chemical and physical characteristics of chromium; use of chromium; chromite deposits of the Pacific Coast; how to produce marketable grades of ore. M. & S. P. August 31, 1918.

ANOTHER LETTER FROM THE FRONT 283

Experiences of a War-hero in the Guards division of the British army; discomforts of life at the Front; petty annoyances worry the soldier more than danger; the crucial test of going over the top. M. & S. P., August 31, 1918.

NITRATE DEPOSITS OF SOUTH-EASTERN OREGON

By Ira A. Williams 285

Geological association of the nitrate deposits; always with rhyolitic rocks and their derivatives; sometimes closely related to organic residua; analyses of samples; extent of prospecting; the bacterial theory of genesis of nitrate deposits. M. & S. P., August 31, 1918.

CONCENTRATES 290

Simplified Arc Welding Equipment Now Ready to Demonstrate

Before ordering your welding equipment investigate the General Electric Company's novel welding system. Some of its points of superiority are:—

1. Constant Energy.
2. Shortest known arc.
3. High efficiency.
4. No resistance in series with arc.

By the use of this equipment good operators are producing consistently perfect welds.

We are prepared to demonstrate this equipment and make good deliveries.

GENERAL ELECTRIC COMPANY

EDITORIAL

LAST week we published a letter from the Front; this week we publish another, feeling certain that they will be read with keen interest. We hope our friends in France and Flanders will avail themselves of the opportunity of sending an occasional greeting, by way of a published letter, to the folks at home. We want to keep in touch with our gallant defenders.

PRESIDENT WILSON'S autograph appeal on behalf of the fourth Liberty Loan is to appear on September 24. It should prove a great help to subscription, for the President has won the confidence of the people and is today recognized as the leader of the embattled democracies of the world. The drive for the next Liberty Loan is set for September 28. This time the flow of subscription should be stimulated by the victorious offensive made by our troops in France; the country must show them that their splendid efforts are appreciated, by over-subscribing the loan.

IMPORTANT additions to our supply of sulphur are being made by the coal mines. Steps were taken in Illinois some time ago to concentrate the pyrite, which occurs in bands, nodules, and lenses, in coal seams, and the same thing is being done in Ohio, West Virginia, and other States. Mr. Wilbur A. Nelson, the State Geologist of Tennessee, announces that several of the larger mines of his State are producing large quantities of that mineral, assaying above 42% in sulphur. The utilization of this valuable by-product is not only helpful at the present crisis, but is in conformity with the principles of true conservation. It will add to the revenue of the coal mines, both now and after the War, and will tend to make the United States independent of imports from abroad.

OUR excellent contemporary 'The Wallace Miner' reproduces the letter by Mr. Thane appearing in our issue of August 3, in which the proposal was made to increase the 'price' of gold to $40 per ounce, and itself publishes a letter from Mr. Chester T. Kennan, in which it is proposed to fix the price of gold at $30 per ounce. Needless to say, we consider such schemes utterly impracticable, if not absurd. The United States is not an island in the Pacific, but one of a comity of nations doing business under an established monetary standard, which cannot be changed except by international agreement. Our own comment on the status of gold mining will have made it clear that we would not for a moment support a proposal so revolutionary, but we do think it feasible to encourage the production of gold by paying a royalty on the metal when produced at the mine.

DESPITE the fact that we have tried, not unsuccessfully perhaps, to give our readers all the information available concerning the mining and marketing of chromite, manganese, magnesite, and other war-minerals, we receive letters asking for data that have appeared again and again in our pages. Since July 1914, for example, we have published 26 pages on chromite and 12 pages on magnesite, not including notes, every week, on the market for these products. Two thousand pamphlets on chromite, by Messrs. Burch and Dolbear have been printed by us and distributed broadcast. Further information concerning the concentration of chrome ore and the preparation of manganese ore for the market is desirable, and we hope that engineers having experience in these matters will aid the national cause by contributing notes on these subjects. Too many people consider the matter that we publish insufficient unless the affairs that lie nearest to their own hearts are given undue publicity. They only need to be reminded of this to appreciate the value of proper proportion. Read this paper carefully, be grateful to the contributors that furnish guidance from their experience, and 'chip in' yourself when you can do so for the general good.

IN the resolutions passed by the American Gold Conference at Reno on August 12, it was stated in the first paragraph that "the [gold] production of California alone having declined $3,000,000 in the first six months of the present year * * *." This is incorrect. An investigation made for the United States Geological Survey by Mr. Charles G. Yale shows that the newly-mined gold received at the depositories in San Francisco for the first six months of 1918, was $1,174,500 less than in the corresponding period of 1917. The State showed a reduction in gold yield of $1,323,237 in 1917, as compared with 1916, so that, on the basis of the above estimate for 1918, the deficit in the output of gold for two years will be $3,672,237. On the other hand, it is well known that two of the leading gold mines of the State are continuing

production at a loss, and must soon cease unless aid be extended; the famous old La Grange hydraulic mine in Trinity county has made its last clean-up; and many other mines are struggling against adversity in the hope that something may happen soon to save them from financial destruction. Therefore the decline during the first half of the current year is not a measure of what will happen in the latter half. The fact that the decrease in gold production in the six months ended June 30 was almost as great as that recorded in 1917, compared with the output in the previous year, may be taken as evidence of a rate of decline that is alarming. If the rate be accelerated in that proportion gold will soon cease to appear in appreciable amount among the products of what was once justly named the Golden State.

NEWS from the Front continues to be splendid. Each of the principal Allies has dealt the Enemy a hard knock, and in such quick succession that he staggers backward to his old defensive line. Our casualties have been relatively small, while the German loss is great enough to prove that he is being out-fought and outgeneraled. This is no time, however, for prophesying a speedy ending of the War; it is a time for concentrating all our energies on fighting it with increasing intensity, so that the German may learn what it means to be invaded, to be bombed, to be driven from hearth and home, to be subject to the pain and horror that he did not scruple to bring upon his peaceful neighbors. All our effort, all the losses of the Allies, will have been in vain—a tragedy so stupendous that it is unthinkable—unless the Germans are deterred from ever again backing their leaders in a mad and murderous ambition to subjugate other nations, and unless the Germans themselves are driven, by the logic of events, to bring those leaders to account. This is no time for boasting nor for complacent satisfaction with our military and naval successes; we must see the thing through to the end, and that end is expressed by two words: Never again.

ANNOUNCEMENT is made in dispatches from Madrid that a diplomatic agreement has been reached between Ambassador Willard and the Spanish government whereby a credit of $100,000,000 will be established in that country for the benefit of the United States, to be applied in the purchase there of supplies needed by our Army in France. This advance will be covered by consignments of cotton and other raw materials urgently needed in Spain. It is a happy arrangement, and will help to cement cordial relations between the two countries. After some minor friction, induced by the pernicious activities of German propagandists in the Peninsula, this *entente cordiale* is most opportune, coming as it does at a moment when the irritation of the Spanish government has grown acute over the persistent sinking of Spanish ships. No one can account for the psychologic dullness of the Teutons, which allowed them to arouse the animosity of the American people, and has again led them to affront the Spaniards, who were disposed to maintain a rigid neutrality. They evidently counted too heavily on the somewhat remote blood-relationship of King Alfonso with the House of Austria. They seem to have forgotten that he has shown a conspicuously democratic spirit, which has made him a popular ruler in a sense that the Hohenzollerns have never realized. A declaration of war between Spain and Germany is wholly probable, and the work being done by Ambassador Willard is demonstrating that the Spanish government may count upon our friendly co-operation.

Gold After the War

In this issue we publish another letter from Mr. Benedict, continuing his useful and timely effort to clarify the terms used in the economics of gold. It is well to take pains not to confuse such terms as 'price' and 'value,' one being exchangeability in money and the other in commodities. 'Price' is the money for which a thing is bought or sold; 'value' is the exchangeability of a commodity in terms of other commodities, of which money is only one. We note that another Gold Conference is to be held, at Spokane, on September 5. We venture to suggest to those participating in the discussion that they take care to use economic terms circumspectly, so as "to avoid confusion and prevent imposition," as is stated not infrequently in public notices. Apparently the Conference at Spokane will follow the lead of that at Reno in being conservative, that is, in rejecting impossible schemes for 'raising the price' of gold, while advocating the payment of a royalty on newly produced metal, an increase in the facilities for transportation, an immunity from Federal taxation, and other helps to an industry now threatened with extinction. It is pleasing to note that the Northwest Mining Association has asked representatives of the American Gold Conference to co-operate at the forthcoming convention at Spokane. On another page of this issue we give an abstract from a thoughtful article appearing in a recent issue of 'The Annalist.' It is worthy of serious attention. The expectation that gold will be in such demand as to command a premium, after the War, if not before it ends, has troubled many men whose experience in finance has made them conscious of the calamity that would result from such a derangement of the money market. A premium on gold signifies a scarcity, and in times of war or political disturbance this shortage is commonly produced by hoarding. Gold, as the measure of value, is a sensitive medium of exchange, and when large amounts of it are in circulation it shrinks into hiding at the first symptoms of over-strained credit. Gold can then go to a premium, but it cannot do so except there be a considerable quantity of it in the possession of individuals. It is the fact of it being offered in the market, appraised by the holder at a high equivalent in terms of the circulating credit-money, that gives it what we call a 'premium.' If the gold is all gathered at the Treasury, that is, in the hands of the collective people, it cannot go to a premium. Our Government has wisely expanded its Treasury-reserve; it has placed it in the vaults at Washington, and

in the keeping of the Federal Reserve Bank as a basis for loans to the National banks; and only a fraction of the total remains in private hands. Even the majority of that small portion is held by State banks, and is not beyond Federal control. So far as the United States is concerned, the safeguards against disturbance of our currency by a premium on gold would seem to be ample. The exchange-value of the circulating medium may be subject to discount if the quantity is in excess of commercial needs at a moment of contraction in the production of commodities, or if the gold foundation for the outstanding currency should prove inadequate. We are not in that position today, and the importance, for financial reasons, of maintaining a steady flow of gold from the mines to the Mint is the valid argument of the gold-producer for Federal assistance at this particular time. *Aprés la guerre* the Germans might be able to do business on three bases: goodwill, credit, or cash. For goodwill they have exchanged, and will continue to receive, during many long years, detestation. Their credit will be shattered, for bankruptcy stares them in the face. They can do business with the civilized world only on a cash basis, and that means gold, and more gold, to obtain which they will have to sweat blood. Their insistent demand for gold will be a prime factor in causing an appreciation as helpful to the miner as the present depreciation, in terms of other commodities, has been crippling. However, the belief that such will be a consequence of the War furnishes no excuse for failure to aid the gold-mining industry now, because every engineer knows, and those in authority, whether executive or legislative, should understand that the cost, in time and money, of reopening a mine that has been idle, is excessive, as compared with the profit to be made therefrom. The economic waste of shutting-down the gold mines and of restoring them later to productive activity ought to be avoided if it be at all possible.

Gold-Dredging and Electric Power

The shortage of electric power in California becomes worse as the dry season advances. The State Director of Power, Mr. H. G. Butler, is urging drastic economy in the use of hydro-electric energy until the reservoirs become filled by the autumn rains. At the present rate of consumption for all purposes in northern California—5,000,000 kilowatt-hours per day—the water stored may be exhausted before the end of the year. An early rainfall is not dependable. It is proposed to reduce the consumption of power for the next two months by 15,000,000 kilowatt-hours per month, equal to 10%. To do this, cement-plants, gold-dredges, and rock-crushing plants, which use 5,000,000, 11,000,000, and 3,000,000 kw-hr., respectively, per month, are to be allotted less power. In a telegram to Mr. McAdoo, Mr. Butler said: "We are convinced that taking off the gold-dredge load would work the least injury to the War needs, and propose taking off this load unless you advise that gold production is equally essential to shipbuilding, food production, transportation, and other direct war industries. Rainfall will probably relieve the situation in three months, possibly before." From this it would appear that gold mining is not included, only dredging. Although the power needs of shipyards, ironworks, munition-plants, irrigation, and food industries, are vital, we venture to protest against this latest order. The Priorities Commission of the War Industries Board recently declared gold to be an essential, and good suggestions have been offered to relieve the crisis, yet dredging, which contributes 14% of the American production of gold, and 41% of that from California, is to be curtailed. A dredge uses a good deal of power, a 15-cubic foot boat of the Natomas company, in fairly tight ground, consumes a total of 1072 horsepower; yet this is the cheapest method of recovering gold from the earth. On one of the dredges of the Powder River company in Oregon the cost of production during the last financial year was $7.40 per ounce of gold. The Natomas company in 1917 recovered 111,000 ounces of gold at an approximate cost of $10.80 per ounce. Compare this with $13.25 per ounce extracted from ore mined and milled at the Plymouth mine, one of the best equipped in the Mother Lode region. Other lode mines show a much higher cost. Some recent statistics of the U. S. Geological Survey, prepared by Mr. Charles G. Yale, bearing on the relation of gold-dredging to total production are illuminating: The gold output of California in 1917 was $20,087,504, a decrease of $1,323,237 when compared with that of 1916; the value of the yield from deep mines declined 14.19%; while that from placer mining showed a gain of 5.81%. Dredges recovered $544,300 more than in 1916. The only increase in 1917 was from dredges. Lode mines contributed 55% and placer deposits 45% of the 1917 output, against 60% and 40%, respectively, in the previous year. Dredges saved 41% of the Californian gold in 1917, equal to 92% of the yield from placers. Yuba—a dredging region—was the only county to show an increase in gold. There were 55 boats operated in 1917, a decrease of five. From 1898 to the end of 1917, the dredges have dug gold worth $95,186,985. Platinum is considered by the Government to be highly necessary, yet, if the dredges are stopped, 90% of the new platinum produced in America will be cut off. The quantity—460 ounces in 1917—is not large, but, in view of conditions in Russia, every ounce counts. It has been officially computed that mining throughout California consumes 15.5% of the total power generated, manufacturing 30.5%, and commercial lighting 14%. The last mentioned is practically equal to the first, but what is its actual value? If 150,000,000 kw-hr. is used each month for all purposes in the State, and 11,000,000 kw-hr. is consumed by gold dredges, they use 7.3% of the total; yet commercial lighting uses 14%. On the one hand, one kilowatt-hour produces 12 cents of new gold, the basis of international credit; while one kilowatt-hour for lighting is relatively non-productive. There is no more need for bright street-lights and signs on Saturdays and Sundays than on the other nights when they are prohibited; also much more power can be saved by reducing

the number of cars running in the streets of our cities. Let the people walk more. Although the price of power was raised 26.6% in July, dredging companies make no plaint on that score, as they are charged a low rate, naturally, as their load-factor is high. On August 21, representatives of the dredging industry waited on Mr. Butler, and, the matter being explained to them, they decided voluntarily to curtail dredging by 33%, until there is enough water for the normal generation of power. There are now 47 dredges working in the State, from Merced in the south to Lewiston in the north. Probably the Yosemite company's dredge on the Merced river and one or two on the Trinity river will not be affected by the ruling; but out of the remaining 42 dredges, 14 will suspend digging for fully three months. The Yuba Consolidated is to stop one 17 and three 7½-cu. ft. dredges, out of eight. The Natomas company will probably shut-down as many; it has 11 at work. The decision is hard on the new dredges in the Redding district, and will certainly make capital shy of going into such ventures, for this adversity may recur. A suspension of 33% of the dredging capacity for three months will reduce the 1918 gold output of California by fully $2,000,000. Is it not a blunder to curtail the production of gold at this time, when other less necessary industries, even luxuries, are consuming electric power?

Nitrate Deposits

The problem of nitrogen fixation is one of perennial interest. The farmer is vitally dependent upon nitrates; the chemist has not yet succeeded in providing the soldier with a reliable, convenient, and sufficiently forceful explosive without taking advantage of certain delicately balanced molecules into which nitrogen enters. For this reason discussions of the origin of nitrates in nature are always welcome, and the article by Mr. Ira A. Williams on the nitrate deposits of south-eastern Oregon, published on another page of this issue, will be read with interest. The conclusion may be drawn from it, as well as from articles and bulletins on nitrate deposits in various parts of the United States written by other observers, that they might almost have treated the subject in the manner of the Celtic historian who won a famous record for brevity in his laconic, but negative, chapter on snakes in Ireland.

The fact is, however, that nitrates have been found in a few localities in sufficient quantity to entice well-meaning and too courageous capitalists to expend money unwisely in a hopeless quest. Mr. Williams adds his warning to that of Mr. Hoyt S. Gale, who discussed the same subject in our columns last November. From this time forth the importance of nitrate deposits will decrease steadily. The only really great commercial bodies of such salts in the world are in Chile, and no great nation will hereafter depend wholly on that distant country for its fixed nitrogen, since technical progress has shown the way to draw it from the atmosphere economically by aid of the electric current at a rate that makes the azotobacteria seem more old-fashioned than a metallurgist of the days of King Og of Bashan. Man will harness the water-powers to fix his nitrogen in future; he will presently do it for less than the cost of leaching and evaporating it from the caliche in Chile; and those economists who had thought of proposing fixed nitrogen as a safe measure of value in a highly cultured currency must despair of ever finding a stable monetary unit. The question of the origin of natural nitrates, therefore, is more academic than important, aside from the application of the argument made by Mr. Williams to disillusion those who seek nitrate in the solid rock. It is a notable fact that the accumulations of nitrate in this country, except as they remain here and there as fractionated concentrations from evaporated lakes in the desert 'bolsones,' are almost wholly on the protected faces of cliffs composed of tuffs, tuff-breccia, and porous lava-flows, of acid types. This is no accident. There must be a genetic relation in a condition that recurs so persistently. Mr. Williams attributes the fixation of the nitrogen to certain bacteria, but he is also puzzled by the facts that the phenomenon is absent from cliffs of other classes of rocks, and that ideal conditions for the formation of nitrates on the acid rocks in the region where some are found do not always produce them. He displays hesitation again when he faces the contradiction that the soil at the base of certain cliffs was not abnormally rich in nitrogen, while the bare rock 25 feet higher was impregnated with nitrate salts. It is evident that both the nitrifying and the nitro-fixing bacteria would have found the soil a more congenial residence. It is a bit surprising, considering the ease with which the plate-test can be applied, that geologists have not taken samples and positively settled, once and for all, the question as to the presence of these bacterial organisms on the nitrate-encrusted cliffs. It raises a question whether the bacterial theory, long invoked to explain the Chilean deposits, is not being overworked when it demands a high degree of discrimination on the part of the azotobacter for special kinds of rocks, considering that his colonies flourish so readily in the soil-detritus from any kind of rock that is not wholly deficient in lime to protect him against too much acidity. The observation made by Mr. Williams that the rocks in which the nitrates are formed show unmistakable signs of hydrothermal action is likely to prove significant. In any case secondary silica is quite certain to form as a result of the alteration of the alkaline silicates to provide the bases found in the encrusting salts. It has been suggested that the occluded nitrogen in the original gases accompanying these acid tuffs and lavas may have continued to react, as they are supposed to do in the magma, producing ammonia, which would oxidize to nitric acid, and thus gradually accumulate at the point where evaporation of the capillary flow took place. The question is worthy of further attention because the public will need to be convinced again, for the cheerful promoter will rise superior to these sane warnings of capable geologists, and an explanation that leaves fewer exceptions unexplained will be more conclusive.

The Market-Value of Gold

The Editor:

Sir—As stated in the daily press, the recent conference of gold miners at Reno adopted certain preambles and a resolution of which the following is an extract; "Whereas, * * * the price of gold, as our standard of value, being fixed by law at the invariable figure of $20.6718 per ounce, thus being the only important product which has not obtained an increased market-price due to the present war conditions."

The phraseology of the foregoing extract is somewhat vague, but it seems to mean that, because our Government has passed a law fixing the 'price' of gold invariably at $20.6718 per ounce, its market-value cannot increase, as have the market-values of other important products on account of the present war-conditions.

Assuming that the above extract is substantially correct, it would appear that the framers of the preambles and resolutions were not entirely conversant with the basic principles of money. These principles have been outlined in my previous letters, in your issues of August 3 and 17, but permit me to add the following, with the object of bringing about a better understanding.

Since gold is the standard by which exchange-values are compared, if any product (commodity) increases in 'price' it means that it will require more gold to purchase a given quantity of such product; therefore, as compared with such product, the exchange-value or purchasing power of gold has decreased. To illustrate this, let it be assumed that about four years ago the 'price' of wheat was $1.10 per bushel, which means that a bushel of wheat was exchangeable in the market for 25.542 grains of gold. The price of wheat now, as fixed by the Government, is $2.20 (that is 51.084 gr. of gold) per bushel, hence it takes twice as much gold now to buy a bushel of wheat as it did four years ago; therefore, as compared with wheat, gold has only one-half the purchasing power now that it had four years ago, or, in other words, its exchange-value (market-price) has decreased 50%.

Again, about two years ago copper sold at 32½ cents (7.5465 gr. gold) per pound in the open market; now it sells at 26c. (6.0372 gr. gold) per lb., (the price temporarily fixed by the Government) a decrease of 6.5c. (1.5093 gr. gold) per lb.; hence, the exchange-value or 'market-price' of gold as compared with copper has increased 20% in the last two years, because it requires only 6.0372 gr. of the former to buy a pound of the latter, in place of 7.5465 grains.

These two illustrations will serve to show that, within a comparatively recent period, the market-value of gold has decreased 50% in respect to one commodity and has increased 20% in respect to another. In each instance, the 'price' of the commodity has been 'fixed' by the Government, consequently the Government has diminished the "invariable" market-price of gold 50% as compared with wheat and has increased it 20% as compared with copper, which proves that the "market price" (meaning exchange-value) of gold is not "invariable," as it is stated in the foregoing quotation from the proceedings of the conference at Reno. The only thing about it that is "invariable" is the fact that 20.6718+ times 23.22 gr. is 480 gr., or one Troy ounce; but that fact has nothing whatever to do with the worth, exchange-value, or purchasing power of an ounce or any other quantity of gold.

W. DE L. BENEDICT.

Del Monte, California, August 19.

The Status of Gold Mining

The Editor:

Sir—Owing to the rising cost of machinery, foodstuff, and labor, while the value of their output is fixed, the gold miner in Canada and the United States is facing unprecedented conditions. At no time, says Secretary McAdoo, has the country so much required the largest possible production of gold. Next to food and ammunition, gold is one of the most important war essentials. The United States and Canada have put an embargo on the exportation of gold from their respective countries. How the gold-mining industry is to protect and maintain its production at the maximum point is no longer a local issue; it has become an international matter. Inasmuch as gold is such an important factor in carrying on the War it is the duty of every loyal citizen to help in solving this insistent problem.

I have seen many valuable suggestions for a solution of the question, among which the two most sensible were: first, by an international agreement to increase the price of gold; second, to give a bonus to the gold miners.

The first suggestion, in my opinion, is excellent, but there is the difficulty of receiving the consent of all the powers interested, because such a change in the standard unit might create a disturbance in the world's economic conditions, with far-reaching consequences. And we must include the neutral countries, which trade with the Allies as well as with the Enemy. They would face a considerable difficulty in adjusting a rate of exchange

and a trade-balance if there were a change in the price of gold.

It is true, the gold-mining operators in Canada and the United States are facing a rising cost of raw material and labor, but many a gold-producing country is still enjoying a fair return from its gold-mining industry, some by having cheap labor while others have cheap foodstuffs as well. These countries would prefer the price of gold to remain as it is rather than take the chances of stretching its long-established standard value. The mine-owners of Canada and America are hit the hardest; especially is this true of those in the Yukon and Alaska, where gold mining is a paramount industry and operating expenses are excessively high at all times. These questions, as matters stand, are American and Canadian questions. Because these two countries are mainly supplying war materials to the Allies and feeding those in the trenches, as well as the civilian populations of Europe, the prices at home have gone up to the present unprecedented mark; and industrial activities have been so intensified as to cause a great demand for both skilled and unskilled labor, and farm-hands as well. The shortage of labor and the high wages, with a fixed value for gold, are indeed the greatest handicaps to the gold-mining industry of this country and that of our neighbor.

The second suggestion, that the Government subsidize the gold miners, may be feasible. The purchasing power of gold has declined to half of what it was before the War. It may decline further before hostilities cease and the market returns to its normal condition. It is doubtful whether the Government would subsidize mining investors, as such, so that they would be justified in continuing operations after paying fair wages to the mine-workers. They may consider that they can make more profit to themselves by investing their capital in digging for copper, lead, or some metal other than gold.

Reviewing the situation, I suggest that the gold mines, for the duration of the War at least, should be controlled and operated by the Government. A satisfactory arrangement to the Government and to the mine-owners themselves could be reached and the investor's interest fully protected. While an individual cannot run his mine with loss for long the Government could, if necessary, for the reason that any deficit may be met by a taxation or else it could be balanced against the profit made in the other departments, such as telegraph, customs, railroad, or post-office. That is why I say that the question is now a Government question, and a question, it might be added, requiring an immediate decision. The principal advantages to the Government would be:

1. An abundant gold reserve in the Treasury, to stabilize the national credit.

2. The returned soldiers could be given suitable employment in mining.

Gold mines, it seems to me, ought to be operated by the Government, because the largest portion of the production has been and is being used by the Government. Nearly 80 to 90% of a country's production, it is said, goes to the Government for coinage, while 10 to 20% is used in manufacturing ornaments. This is not true of the other metals.

S. KAWAKAMI.

Dawson, Y. T., August 8.

Formulas for Mine-Valuation

The Editor:

Sir—I have read with interest W. W. Whitton's paper on 'Mine Valuation' which appeared in your issue of May 18 and, while agreeing with him that the Hoskold formula is in error, and that a new one should be adopted for the valuation of mining investments, I do not consider that Mr. Whitton's is constructed on the correct hypothesis to fulfill the purpose. A new one is here suggested, and a short comparison of the three formulas given, with redemption-tables for the typical case cited by Mr. Whitton.

The theory on which the Hoskold formula is based is that the dividend received from a mining investment must be regarded by the investor as being composed of two constant parts, one representing interest on the original investment (at a rate which is considered commensurate with the risk) and the other a return of capital, which latter must be of such amount that, when re-invested at compound interest (security rate), it will equal the amount of the original investment when the mine is exhausted and the dividends cease. Mr. Whitton agrees with the Hoskold theory of separating the dividend into two such parts, but disagrees with Hoskold's method of apportionment, and he considers that the risk-rate of interest should be expected only from the amount of capital remaining unreturned, and that, therefore, the two parts of the dividend should not be constant but varying, the amount of risk-rate interest annually decreasing, and the returns of capital correspondingly increasing in the investor's segregation of dividend. I agree with him up to this point, but believe he is in error in constructing his formula on the assumption that the compound interest on accumulating returned capital is to assist in bringing it up to the amount of the original investment in the stipulated time, and I suggest that it should be so constructed as to bring about that result without the assistance of interest; otherwise the investor places himself in the position of having the whole amount of the original investment tied up while drawing interest on a continually decreasing portion.

The formula here suggested is based on the assumption that the investor, while drawing risk-rate interest on the amount of capital remaining in the original venture, is also entitled to security-rate interest on the portion that is considered to be returned, for it necessarily does not come into his use if it must be set aside as a sinking-fund. By way of illustrating the application of the three formulas in discussion, a comparison of redemption-tables for the typical case cited by Mr. Whitton is appended. The typical case is that of a mine with an expected life of 10 years, paying an annual dividend

of $1000, the rate to be allowed on the investment to be 10%, and the redemption-fund placed at interest at 4%.

Using the same notation:

j = rate at which sinking-fund is to be placed at interest.

i = rate to be realized on the mining investment.

d = amount of annual dividend in dollars.

n = years of life of the mine.

V = present value of the investment.

The formulas are as follows, with values of investment computed from them:

HOSKOLD—

$$V = d\,\frac{(1+j)^n - 1}{(1+j)^n i - i + j} = \$5455.81$$

WHITTON—

$$V = d\,\frac{(1+i+j)^n - 1}{(1+i+j)^n i + j} = \$6591.37$$

NEW—

$$V = d\,\frac{(1+i)^n - 1}{(1+i)^n - i} = \$6144.58$$

The redemption-tables constructed on the above formulas are as follows:

HOSKOLD

Year	V	d	Vi	$(d - Vi)$	Amount in sinking-fund
1	$5455.81	$1000	$545.58	$454.42	$454.42
2	5455.81	1000	545.58	454.42	972.02
3	5455.81	1000	545.58	454.42	1418.52
4	5455.81	1000	545.58	454.42	1929.68
5	5455.81	1000	545.58	454.42	2461.28
6	5455.81	1000	545.58	454.42	3014.15
7	5455.81	1000	545.58	454.42	3589.14
8	5455.81	1000	545.58	454.42	4187.12
9	5455.81	1000	545.58	454.42	4809.03
10	5455.81	1000	545.58	454.42	5455.81

WHITTON

Year	V	d	Vi	$(d - Vi)$	Amount in sinking-fund
1	$6591.37	$1000	$659.14	$340.86	$340.86
2	6250.51	1000	625.05	374.95	729.44
3	5861.93	1000	586.19	413.81	1172.42
4	5418.94	1000	541.89	458.11	1677.43
5	4913.93	1000	491.39	508.61	2253.13
6	4338.22	1000	433.82	566.18	2909.44
7	3681.91	1000	368.19	631.81	3657.62
8	2933.72	1000	293.37	706.63	4510.56
9	2080.78	1000	208.08	791.92	5482.90
10	1108.44	1000	110.84	889.16	6591.37

NEW

Year	V	d	Vi	$(d - Vi)$	Amount in sinking-fund
1	$6144.58	$1000	$614.46	$385.54	$385.54
2	5759.04	1000	575.90	424.10	809.64
3	5334.94	1000	533.49	466.51	1276.15
4	4868.43	1000	484.84	513.16	1789.31
5	4355.27	1000	435.52	564.48	2353.79
6	3790.79	1000	379.08	620.92	2974.71
7	3169.87	1000	316.99	683.01	3657.72
8	2486.86	1000	248.68	751.32	4409.04
9	1735.54	1000	173.55	826.45	5235.49
10	909.09	1000	90.91	909.09	6144.58

An analysis of the redemption-tables above will show the return to the investor to be as follows, under the several formulas:

Year	Hoskold, %	Whitton, %	New, %
1	10	10	10
2	10	9.48	9.62
3	10	8.89	9.21
4	10	8.22	8.75
5	10	7.45	8.24
6	10	6.58	7.70
7	10	5.58	7.09
8	10	4.45	6.43
9	10	3.16	5.69
10	10	1.68	4.89

The Hoskold formula provides for an income at risk-rate each year on the original capital, irrespective of the fact that an annually increasing amount of it has been removed from the venture on which the risk-rate should be paid.

The Whitton formula provides for an income at a risk-rate on the unreturned capital, but no income on the returned capital tied up in the sinking-fund.

The new formula provides for an income at a risk-rate on the unreturned capital and security-rate (or as the investor may elect) on the returned capital, the combined income varying from risk-rate to security-rate according as capital is removed from one class of investment to the other.

In the tables given above for rate of income, it is presumed that the investor under the new formula has reinvested his returned capital at 4%.

D. B. MORKILL.

Hazelton, B. C., June 1.

Flotation and Other Troubles in Mexico

The Editor:

Sir—Appreciating your endeavor to print only correct English, I believe you should be consistent and print pictures that are true to life even though they be advertisements. Like the man that wants to boost your 'Review of Mining' automobile to the top of the hill, I would like to give orders immediately that no more concentrate be left on an open platform as shown in your advertisement of the K & K Flotation Machine Co., on page 24, of the advertisement section in your issue of July 6. This building should be enclosed at once, a 10-ft. stone or adobe wall built around the mill placing broken bottles in mortar at the top. Gun-towers should be placed at the corners and an 'escolta' of at least 20 men. We have done this to our mill and have even installed two K & K machines, yet they are stealing. The picture apparently is supposed to represent a mill in Mexico.

Our company, the Cubo, is operating a 200-ton per day flotation plant (at present treating only about 150 tons per day) with fair success. The ore averages approximately 350 grammes silver with 5 gm. gold. The mill is equipped with 40 stamps, eight No. 2 Deister tables, two 5 by 18-ft. tube-mills, Dorr thickeners, two K & K flotation machines, and two Hynes disc flotation

machines, and a Portland filter. We consume 400 gm. of oil per metric ton: Mexican crude for a 'collector,' plus about 90 cc. No. 350 Pensacola T & T Co.'s pine-oil as a 'frother.' The concentrate assays approximately 10 kg. silver with 190 gm. gold. About 25% of the silver and 45 to 50% of the gold is recovered on the tables before flotation. We are equipped to table-concentrate either before or after flotation, or both before and after. We now believe table-concentration before flotation is the better method. The recovery of the gold is almost complete—say, 95% or better. We have not run long enough to determine the exact figure. I am having a hard time explaining how my actual concentrate shipments show a gold recovery of 101% for the last two months as against the assay of ore to mill-bin. I had insisted that our automatic bin-sample was quite accurate. Gold in tailing is a mere trace. Recovery of the silver is not so good, but our experimental work gives us hopes that it will improve. One of our hindrances is the lack of clean water. We have mine-water containing ferric oxide and iron sulphate; this comes from an old abandoned mine, our own mine-water, which is quite clear, being unavailable. Creek-water at this time of year is a nice bright-yellow. We can take our choice, though both are limited and we have to recover the water. The pulp will not settle in acid mine-water or dirty creek-water. Lime unquestionably interferes with flotation on our ore if added in excess. A small amount of lime apparently is not harmful, it is less harmful at least than dirty solutions. We are using a small amount; solution tests show 10 to 15 gm. CaO per ton as it goes to the flotation machines. If lime goes over 20 gm. CaO per ton, the recovery drops. If the operator goes to sleep and allows the Dorr overflow to run dirty, the recovery drops almost to nothing. Soda-ash added just as the pulp enters flotation machines precipitates the excess lime, forming calcium carbonate and sodium hydroxide. Our best experimental results are obtained in an alkaline solution of sodium hydroxide. The soda-ash undoubtedly helps to some extent, but so far the increase in the silver recovery by its use does not pay. The cost at mine is 20½c. U. S. per kilogramme.

Like most of the Guanajuato companies, we have considerable old filling. Some of this is mixed with our present ore; however, we are gradually getting the old chutes cleaned out and shortly will have only freshly broken ore. Experimental work on the 'fill' ore has not been satisfactory. The small amount in our present output may be interfering with the milling. I find that the ore from certain parts of the mine contains silver chloride; I am now working on this question to see if it be possible to float this mineral by the use of sodium sulphide. Thus even though today we could do slightly better with cyanide, our results are sufficiently satisfactory to warrant us in going ahead with flotation. We can repeat our present work; we have hopes of doing better.

At first we tried to get flotation operators from the States. We have found that their half-baked knowledge, obtained from practice in copper mills, is of more harm than benefit. We prefer a green man. Flotation of silver ores where the flotation ratio or rather concentration ratio is from 40:1 to 50:1 is quite different.

We prefer the Hynes disc machine. The rotor is made of a shaft on which are mounted a hundred perforated discs, 30 in. diam., spaced 1¼ in. apart. The rotor revolves 100 times per minute. The revolving discs tend to agitate the pulp and the perforations carry the air down into the pulp. The froth collects and is removed as in other machines of this type. The Hynes machine is not sensitive to a slight change in the density of the pulp or a change in the oil. It has given very little trouble mechanically.

Operations are all but impossible here now; how we manage to work at all is a question we ourselves could not answer, yet we work along. I often wonder 'if the game is worth the candle'; at best we hope only to about break even. I all but forget at times that I am married and have a family, for I see them so seldom (my home is at Berkeley). I believe it would be better to join the colors, there would be a little glory in being bumped off at least in France, it would be most humiliating to let a pelao have that honor.

I have just received the results of a run we made with a stock of clear water that we succeeded in obtaining. The silver recovery shows a decided improvement, more nearly approaching our experimental work in clean water. This would confirm Mr. Pearce's conclusions, as well as your own as mentioned in the article on 'Flotation of Gold and Silver,' at the Argo. It is better to use fresh water than attempt to recover water from the thickeners. I now consider this our main problem; how I am to get clean water is a question I cannot answer at this moment. Both the mine and creek water are exceptionally dirty at this time of the year (rainy season). Rain-water has entered the mine, washing down various salts and 'muck' from the upper levels.—Vale.

Guanajuato, July 19. BENNETT R. BATES.

SALT is so abundant and so widely distributed in the United States that the industry can meet domestic requirements in spite of unfavorable conditions, according to R. W. Stone of the U. S. Geological Survey. At some plants in 1917 there was shortage of labor, difficulty in obtaining fuel, and an inadequate supply of freight-cars, yet the total production for the country was a notable increase over that of 1916. The salt produced and sold in 1917 was 6,978,177 short tons, valued at $19,940,442, an increase of 9.7% in quantity and 46.1% in value over the production of 1916. Evaporated salt amounted to 2,482,564 tons, in brine 2,890,588 tons, and rock salt 1,605,025 tons. While Michigan leads in output, it is followed closely by New York. Ohio yields half as much as New York. Kansas, California, Texas, and Utah are the other important States. Imports were negligible in 1917, totaling 64,922 tons; while exports were nearly double this quantity.

The Gold Producers' Harvest Will Come When the War Ends

From 'The Annalist', of August 12, 1918

Doctors remark that patients seldom have major and minor diseases at the same time, but when they do fatal results customarily follow the complication. The War is trouble enough, without having price and credit troubles as "added attractions," according to the vaudeville programs. It would make for the world's recovery from its afflictions if it could deal with its troubles in order and postpone what can be postponed.

All the arguments for action in favor of the gold industry regard it as a burden instead of a convenience that there should be a fixed Mint price for gold. They fail to remark that they are under no compulsion to sell to the Mint, and that they do not sell to the Mint as selling usually is understood. Theoretically they receive their metal back again, in coins of certified weight. They often are paid in checks rather than in bullion, but that does not alter the fact that they get from the Mint all that they give to the Mint, less only an inconsiderable Mint charge. The Mint price has nothing to do with the worth of the gold. That is settled now, as it was originally settled in England, by the universal market for all commodities. Gold is worth what it will buy, no more, no less. The worth of gold is fixed by the price of commodities as much as the worth of commodities is fixed by the price of gold. The goods buy the gold, and the gold buys the goods. The market is free even in these war times, and all buyers and sellers fix their own prices for whatever they own, whether goods or gold, subject only to the control which affects goods and gold alike, for reasons independent of the price or value of either goods or gold.

It would make little difference whether the Mint price were doubled or halved. In either case the bargains would be for the weight of gold which passed, and which is certified to all buyers and sellers. The producers of gold get their profit when they spend it, not when they mint it. The alteration of the Mint price would be disturbing generally, without benefit to them. What they want really is an alteration in their favor of the relation of the prices of goods to gold. It is difficult enough to control individual prices. It is practically impossible to control the relation of one price to another. Gold and goods are exchanged around the globe in these days, and the attempt to control the value of gold in international exchange—something quite different from the control of the Mint price—requires control of world conditions.

The point may be illustrated by what is happening in London now. The Mint price of gold in England is unchanged at 85s. an ounce, but the market price for gold as a commodity is 115s. Thus minted coins have a premium worth, and Scotland Yard is busy checking the illegal traffic in sovereigns and eagles. This is a sequel of profiteering by labor. Workers are receiving wages beyond all their experience, and there is a run for jewelry which exhausts the supply of gold, the commodity. A sovereign makes a ring for which jewelers can get half more than the Mint price of the coin, and gold has disappeared.

Before the War strangers were paid gold in England, and checks were paid to those having bank accounts only. Gold then passed from hand to hand, but now the stranger offering gold in London is looked upon with suspicion. The place of gold in circulation has been taken by Treasury paper, resembling either our greenbacks or 'shin-plasters'. Gold is rationed, and the police observe the uses made of it. If our gold producers want more than the Mint price they can hold their goods until the market meets their views of what gold is worth, as in London. The claim of the producers of gold upon the public consideration is the same as that of producers of other commodities. If they supply the thing which is especially wanted an especial price will and should be made for it. But other things are more necessary for war than gold, such as iron, coal, munitions, ships, and so on. The line must be drawn somewhere. Priority cannot be given to everybody, and a special price cannot be made for everything.

The producers approach this point when they argue regarding the universal need of gold as the basis of credit. The argument would be stronger in normal times. While it is true that the production of gold is falling off the bank reserves are increasing faster than the gold production decreases. While the British gold production has been falling some $6,000,000 this year the reserve of the Bank of England has risen $50,000,000. The Bank of France's reserve is 148,000,000 francs larger this year. Our own bank reserves are ample, and the country's stock of gold has been embarrassingly large, exceeding anything in world experience. Even in Germany the gold reserve is larger by 93,000,000 marks, swollen, it is said, by the annexation of Austria's reserves, which are probably next lowest to Russia's.

It is true that while the gold reserves are larger absolutely they are smaller in relation to the credit based upon them. But in times like these there are substitutes for luxuries when there are no substitutes for necessities. Iron is a necessity, and tin or copper another. That is why they are at a premium, commanding a scarcity price, although the production is above all records. But patri-

otism is a good basis for credit in times like these. We have seen 17,000,000 Americans subscribe for Liberty bonds at a price above the rate for credit ex patriotism, and take their loss proudly and smilingly. That is why there is strong expectation that 34,000,000 will take larger amounts at the next offering, regardless of the loss to the 17,000,000. Redemption of plighted faith is the explanation of the placidity of Englishmen under paper money circulation and a bank reserve alarming under normal conditions. France is under pillage by descendants of the execrated Huns for the second time in modern history, Germany's present demand being for the other half of the iron deposits which it left on a mistaken report of its men of science and ironmasters after the Franco-Prussian war.

There is a double reason for drawing the contrast between France's need and neglect of gold and Germany's desperate search for it in individual pockets and tills. France is an investing nation. Germany is a manufacturing and trading nation. France saves money and accumulates capital put at the use of others for interest. Germany 'makes' money by mercantile profits great in contrast to the narrow reward which satisfies French thrift and patient accumulation. When peace shall return England, France, and the United States will supply themselves with all the gold they need, either by economies, or production, or trade. It is different with Germany. She must buy her gold, for she is too poor a country to save it, even if the Germans were a saving rather than a pillaging people.

After the War there will be a demand among the Teutonic Allies which will sop up all the billions of gold which can be produced on earth. That will be the time of ancient profit for all the gold-producing and gold-owning nations. Germany must be supplied with gold least of all for the sake of Germany or the Germans. They have forced the world into indifference to the sufferings they have brought upon themselves. Germans have passed upon themselves a special renewal of the Divine sentence that in the sweat of their brows they shall earn the fine which is the penalty of their immoralities. The world was a beehive of industry which the Germans overturned, and destroyed the bees for the sake of the honey. In the future the Germans shall be the bees to which the civilized world must feed gold in order that they may make the honey which the world shall garner until Germans have earned the right to be admitted to terms of equality in trade with honest men.

No one has calculated, or perhaps can calculate, the gold which it will be necessary to supply to the Teutonic Allies in order that they may work out their own salvation. The rehabilitation of Germany's destroyed industry and trade will sop up gold like water on sand. The gold must be supplied or Germans cannot work for the world. Naturally Germany cannot get gold for nothing. She must purchase it with cheap goods, and the degree of cheapness will be decided by the owners of gold. If this war has taught anything it has taught that what men want is "goods and services," and that gold is wanted only to command them. Germany's debt to the world cannot be paid in gold, for she has it not. It must be paid in goods and services, or otherwise the world will be poorer and Germans must starve.

The demand for an economic boycott of Germany means that the world should deny itself the cheap goods which Germany can produce better than other people. No man ever thought he was ruined individually by cheap goods, but entire nations have been taught that they were in danger of ruin by being 'flooded' with cheap products. In like manner the gold producers think that the source of their troubles is the cheapness of gold, which does not now produce for them the goods and services which they want in accustomed plenty. What they really need is access to the best market for gold in the world. When the freedom of the seas is restored they can sell their gold to Germans for goods and services which will reduce the world's cost of living.

The Kaiser vaunted that Germany had abolished international law, whereas in fact international law with a sanction dates from the invasion of Belgium. If international law is established on the basis of the common law of all peoples, including the Germans among themselves, then there is an end to the uneconomic cheapness for German goods, made from stolen materials and sold in unfair competition. German goods will not be too cheap, for they must include the cost of what goes into them. That is the meaning of this war for raw materials. They must be bought hereafter by everybody. That is the moral interpretation of Belgium's glorious vicarious sacrifice. When Germany sold its soul for profit, England redeemed its soul at the cost of millions of men and billions of pounds. France fought for the world as well as for itself during all these four years when the blood which has drenched her soil has been spent that American blood need not be shed on American soil.

For three years we coined billions of money out of the agony of our allies, while we were making up our minds about the morality of the issue on which we prided ourselves in being neutrals. If we are to retain a shred of honest pride it can be only by generosity toward those whose ideas of honest trade and profit are the same as ours, and by that justice which will fall hardly short of just severity toward the accomplices of the Kaiser. Every German who has contributed to the German debt is a partner in the Kaiser's blood-guiltiness and plot to take the goods of neighbors even by wholesale murder. Germany's least penalty should be that her national debt shall be a first mortage to pay her fine under international law. Never was a debt floated for such objects before, according to the boasts and confessions of Germans of highest degree.

Germany must sweat goods to repay the sweat of blood by others, and incidentally to give to gold producers of all lands their accustomed command over other goods. There is no need of gold reserves for that object. To that we have pledged all that we have and all that we are. Meanwhile bank reserves and profits to producers of anything are "postponed," in the word of our President.

Chromite

By J. C. WILLIAMS

*The most important foreign deposits are those of New Caledonia, Turkey, and Rhodesia. In addition chromite is mined in small quantities in Russia, India, Australia, Greece, Canada, and Newfoundland. All foreign deposits occur as irregular masses, or pockets, similar to the deposits in California, so that mining and treatment methods similar to those used abroad can be used here.

When it is realized that in 1916 the imports of chrome ore amounted to 114,655 long tons, the importance of domestic sources becomes apparent. In 1913 the output in the United States was 244 tons; in 1916, about 47,000 tons; and the 1917 output is estimated to have been 41,000 tons. The yearly requirements are more than 150,000 tons. The most valuable deposits of chrome ore in the United States occur in California, Oregon, Maryland, Pennsylvania, North Carolina, and Alaska. The greatest part of the country's supply is on the Pacific Coast and the greatest demand on the Atlantic. Transcontinental transportation from the producers to the consumers is, therefore, a large problem in itself. It must be borne in mind, when noting the increase of domestic production from 1913 to 1917, that the ore that has been extracted came from localities which have been well known for a number of years and which were easily accessible. The future production must come, to a large extent, from places difficult of access with probably a long haul to a railroad. Possibly some output may come from small or low-grade deposits, in spite of the fact that the final cost of the product will be greater than that of material from deposits of a more favorable nature.

In the United States chromite in commercial quantities was first discovered by Isaac Tyson, Jr., near Baltimore, Maryland, in 1827. The story of the discovery and development forms a most interesting chapter in the history of American mining. Tyson had become interested in the recently discovered element chromium and at that time was probably the only man in America who possessed the knowledge necessary to make use of his discovery. He one day noticed a farmer driving a wagon in which were barrels kept from rolling by blocks of heavy black ore. These he determined to be chromite. He found the locality from which they came and acquired chromite-bearing ground. He studied these deposits and came to the conclusion that chromite would be found only with serpentine, a line of reasoning that enabled him to discover chromite in other localities. From 1828 to 1850 the district near Baltimore supplied most of the chrome ore consumed by the world. The manufacture of chrome yellow was started there in 1828. The export trade from Baltimore came to an end about 1860 on account of the development of the larger and richer Turkish deposits.

The demand for chrome ore arises chiefly from its use in making alloys, such as ferro-chrome and the like, used in manufacturing steel for projectiles, for armor plate, and for cutting tools; in making refractory chrome brick and furnace-lining; in chemical industries for the production of many colors and dyes; and in tanning. Its application for these purposes is increasing and the demand for it is steadily growing. On account of its great heat-resisting qualities chromite is used as a neutral refractory lining for furnaces. It is either made up into bricks with various binders, or lumps of the ore are packed in tight to make a solid lining. Chromite has two valuable qualities for these purposes: it stands change of temperature well and also resists strongly the action of molten metals. For refractories an ore containing 38 to 45% of chromic oxide can be used. The most important use, however, is for making ferro-chrome.

The word 'chromium' is derived from the Greek word meaning color, on account of the wide range in color of various salts of chromium. Chromium also forms the coloring matter of several minerals; the green color of the emerald is due to chromium. Metallic chromium is not known to occur in the native state. According to Roscoe and Schorlemmer, metallic chrome forms a light green glistening powder which exhibits, under the microscope, aggregations of crystals of a tin-white color, with a specific gravity of 6.81. The fused metal is usually as hard and tough as corundum, melts at a higher temperature than platinum, is not magnetic, and, when ignited in the air, is only slowly oxidized. Heated in the oxy-hydrogen flame it burns brightly, with emission of sparks, and when fused with saltpetre or potassium chlorate, it is converted into potassium chromate. Pure chromium was obtained in 1894 by Moissan, by reducing the oxide with carbon in the electric furnace. It is most easily prepared in small quantities by the aluminothermic process, which consists of reducing the oxide with aluminum powder. Metallic chromium made by this process is used to the extent of several hundred tons per year in the manufacture of high-speed tool steel, as some manufacturers prefer to add their chromium this way rather than as ferro-chrome.

The principal alloy of chromium is ferro-chrome; the alloy of chromium and iron, which contains usually 60 to 70% chromium. It is now produced in the electric furnace from high-grade ores. Other alloys of more than scientific interest are chromium with nickel, cobalt, molybdenum, tungsten, manganese, copper, or vanadium, as well as different combinations of two or three of these elements. One of these alloys is called 'stellite,' and is composed of cobalt, chromium, tungsten, and molyb-

*Abstract from circular issued by the Colorado School of Mines.

denum. It was developed by Elwood Haynes of Kokomo, Indiana. Two desirable qualities of this alloy are its resistance to corrosion and its ability to take and hold an edge equal to that of the best steel. It may be used for table-knife blades, pocket cutlery, surgical instruments, dental instruments, small evaporating dishes, spoons, forks, or scissors.

Chromium is added to steel in the form of ferro-chrome or as metallic chromium. This steel is particularly adapted for making armor-piercing projectiles, on account of its hardness and also its very high elastic limit. It is also used for armor-plate for the same reasons, for parts of crushing-machinery, and for very hard steel plate. It is extremely hard, tough, and dense, and possesses great tensile strength. It is especially adapted to severe service and where resistance to abrasion is desired. For the wearing parts of stamp-mills, such as battery shoes and dies, cams, and tappets, chrome-steel has proved to be the most durable and economical material obtainable. Chrome-steel in some respects resembles the higher grades of tool-steel, but in addition possesses properties combined in no other known steel. It can be made so hard as to be drill-proof against the finest tools. These qualities are taken advantage of in the manufacture of burglar-proof safes and jail-bars, built up of alternate layers of iron and chrome-steel, which cannot be cut or broken. Armor-plate contains about 2% chromium and a certain quantity of nickel. Some steels have been made that contain as much as 20% chromium which have unusual qualities.

Although a number of minerals contain chromium, virtually only one—chrome-iron ore or chromite—is a commercial source of chromium. However, it is of interest to note that the discovery of the element chromium was made by investigation of the mineral crocoite (lead chromate). The discovery was made by Vaquelin, a French chemist, in 1797.

Chromite is isometric. Massive, fine granular to compact. Fracture uneven. Brittle. Hardness, 5.5. Specific gravity, 4.32 to 4.57. Lustre, submetallic to metallic. Color, iron-black to brownish-black, sometimes yellowish-red in thin sections. Streak brown. Translucent to opaque. Sometimes feebly magnetic. Composition, $FeCr_2O_4$ or $FeO \cdot Cr_2O_3$ = chromium oxide 68%, iron protoxide 32%. Infusible before the blowpipe in oxidizing flame; in the reducing flame it is slightly rounded on edges and becomes magnetic. With borax and salt of phosphorus it gives beads which, while hot, show only a reaction for iron, but on cooling become chrome green; the green color is heightened by fusion on charcoal with metallic tin. It is not acted on readily by acids, but is decomposed by fusion with potassium or sodium bi-sulphate.

Chromite is a common constituent of basic intrusive rocks, such as pendotites and pyroxenites, and especially of serpentine derived from them. All of the commercial bodies of chromite occur in these rocks. In place it is always found in association with serpentine, which has resulted from the alteration of basic rocks consisting of olivine, hornblende, and pyroxene. In these the percentage of chromium may vary from 0.05 to 0.5. Chrome is by no means an important element in the earth's crust. The average given by F. W. Clarke is 0.033%. Although it occurs usually in basic igneous rocks, it is sometimes found in titaniferous iron ores to the extent of several percentages. It is rarely associated with other metallic minerals, except possibly magnetic and nickel minerals. The common form of occurrence is as rounded grains or more often massive granular bodies, which resemble magnetite and have sometimes been confused with it, but differ from it in being at the most feebly magnetic. It is a most resistant mineral to weathering. For this reason it is often found in unconsolidated materials such as clay, or in stream materials derived from rocks by erosion. In the weathering of serpentine the more resistant chromite will be concentrated on or near the surface and be misleading as to the richness of the deposit below. Placer deposits of chromite are found where the minerals most resistant to weathering have been concentrated in stream channels, and where these drain areas of serpentine or basic igneous rocks. Along the Pacific Coast there are placers in stream beds and beach deposits that carry, besides chromite, resistant minerals such as gold, platinum, and garnet. The pockety nature of chromite deposits makes the mining very uncertain. There may be one or more of these pockets or lenses scattered through the deposit, but they are not regular.

The production of a high-grade chrome concentrate may be made in two ways: (1) by hand-cobbing, (2) by mechanical concentration. Hand-sorting is generally practised in mining the ore, by means of which a high-grade product may be made without the losses attendant upon crushing and milling. In milling chromite the general practice is to crush in Blake crushers and then by stamps. The crushed ore is treated by classifiers and fed to tables of the Wilfley type. For deposits such as beach sands, which contain, besides chromite, many minerals with different degrees of magnetic permeability, magnetic treatment is a practical solution of the concentration problem. In general it may be said that a concentrate containing 45% of chromic oxide is sought, as material of this grade finds a ready market at satisfactory prices. In Canada ore containing as little as 10% chromic oxide has been successfully treated.

Characteristic features of chromite, by which it may be recognized: Lustre: vitreous, splendent to metallic or sub-metallic. Streak: dark brown. Infusible before the blowpipe but may fuse slightly in the reducing flame and then becomes magnetic. Usually associated with serpentine. Each grain shows a very smooth conchoidal fracture with high lustre.

MANGANIFEROUS-IRON ore occurs in large quantities in the northern part of the Cuyuna range of Minnesota. Seven deposits average 230,000 tons each, eight contain 196,000 tons each, and six contain 1,550,000 each. These contain 10% Mn. Under 10% there are nine with 530,000 tons each.

Another Letter From the Front

Somewhere in France, July 20, 1918.

About an hour after mailing my last letter to you, I received an order attaching me for duty to the famous Guards division of the British army. I have been with them until yesterday, when I returned here, where I am to be for about three months attending the General Staff College.

I hardly know how to begin to tell you of my experience with the Guards. It all seems so like a fairy tale. The mere fact that of all the divisions in the British army I should draw the Guards is a wonderful bit of luck in itself. Within a very few hours after receiving my order, I was on my way, and though I had what we would consider a relatively short distance to go, it took me nearly 36 hours to get there (it should have taken about six), but traveling in the actual war-zone is very slow, unless one is moving with troops. However, the journey was intensely interesting, because it was through a part of France where some of the most furiously fought battles of the War have taken place. A British brigadier who had fought all over that section was traveling in the compartment with me, and he fortunately was willing to talk, and gave me most interesting information about what had taken place, and how the tide of battle had ebbed and flowed over the very ground we were slowly proceeding across. Oh, the desolation and wanton destruction! It can't be described. One wanted to weep and swear at the same time—it is so pathetic and so hellish. As a result, every time I saw a Boche (and I did see hundreds of them, thank God) I wanted to kick him in the face if he had any left—many of them didn't—or violate his infernal carcass in some other way. Really, you cannot actually hate until you have been through this thing, and for your own sake I hope you never will, for it puts a streak of iron in one's soul that civilized human beings should never have. There is a bitterness engendered in man that must have an unpleasant and everlasting influence upon my life, no matter how short or how long that life may last. But I must not dwell on that. By the time I had reached my destination I had received a first-hand impression and understanding of the War as it has been, and as it is, far more vivid than I ever hoped or expected to have.

Upon reporting to the Chief of Staff, I was cordially received, and it being about lunch time, I was taken to the Major-General's mess, of which I was to be a guest while at division headquarters. Well, I wish you could have seen that meal, or more properly, could have eaten it. Instantly I thought of you and our mess at McAllen—it was so damned different. There we were within artillery fire of the German front line, we could distinctly hear the roar of the guns, yet the meal served and the manner of serving it would compare quite favorably with M's best effort, and that is going some. But this is not a panegyric on food. I merely mention it to show how wonderfully they do things after four years of hellish war. The Major-General is a man whose name you would recognize at once, but I must not mention it. He has a string of initials a yard long after his name, but be seemed really interested in questioning me about myself, our army and what they expected of us, and altogether was perfectly charming. He directed his A. D. C. personally to see to my billet and that of my 'servant,' and this suggests a subject about which one could write at length, for the servants in the British army are real artists. The one assigned to me was named Macgregor, so you can judge which one of the Guard regiments he came from. He was a wonder, and seemed to anticipate my every wish. Wherever I went to spend the night, even in the front line, he went too, packed and unpacked my stuff, and saw to its transportation. Ye gods! what luxury not to have to depend upon a 'detail' whose fingers are all thumbs, to do such things, and then finally have to do it oneself. I was to have the billet of a colonel who was going on leave, the next day after my arrival, so, after many apologies, I had to occupy for one night a heap of debris that had once been a fine room, but a 12-inch shell had taken a few liberties with it, and about the only accommodation it offered was protection against rain, provided it came down straight and not too hard. It was cold as blazes, but my man made me quite comfortable for the night. Next morning, however, it was hell. I heard him fussing around about 7:30 and watched, when he was not looking, to see what he was doing. Imagine my horror when I saw him bring in a large collapsible tub and start to fill it with water. Ugh! finally, after much formality, he informed me "Your bath is ready, Sir," and there was nothing for me to do but get up and stand in the damned thing while he poured petrol-tins full of water over me. Really, I deserve the V. C. for that, yet I would rather have been shot on the spot than to have hesitated, for Macgregor would have considered himself disgraced for life if 'my officer' had shown himself to be such a weakling. No matter what the future has in store for me, it cannot be more trying than that bath or require more courage to face. Macgregor decided what I should wear, made me change my clothes for dinner every night, even in a front-line dug-out, and in about two days had all my leather stuff so I could see my face in it. They are great sticklers for that, as you probably know, and although the mud in the trenches outside was knee-deep, you were expected to have immaculate boots when you first stepped into it upon leaving your dug-out. Of course the Guards are noted for their 'swank,' but it seems incredible that they could carry it so far, and how it does make for discipline! Our ideas are really absurd, compared to the perfection to which they have developed it. I never believed such soldiering was possible, and

with it all there is the most wonderful camaraderie between all ranks. Each officer is called by his first name, or more commonly by some queer nickname, that is, all except the General Officers and C. Os. The consideration shown to the enlisted men by the officers surprised me most of all; there is always an unbridgeable gulf, yet no one had too much rank to say "Thank you' and 'If you please.'

After two days at division headquarters, studying the tactical position, I went to the front line and spent 36 hours in a company headquarters, then two days and nights at battalion headquarters, finally getting back to brigade headquarters for three days and nights. The distance from the Boche front line ranged from 40 yards, while in the front line, to about 1000 yards when in the brigade headquarters. All the time, of course, I was living in various dug-outs. I expected to find things a bit rougher when I left division headquarters to go nearer the front, but not at all. The same delightful formality prevailed, and the dinner I had within fifty yards of the Hun line consisted of five courses, beautifully cooked and served, with Scoth, port, three liquers, and beer to select from. I had my tub and shaved every morning, polished boots, and clothes cleaned of all vestige of mud awaiting me. Now, don't think I am romancing in the least. I know it seems impossible, but upon my word, I really am moderating my description for fear you may think I am just lying. The answer is simply this: these chaps have been in this war so long that it has become a matter of routine with them. Their sirvice of supply is the most wonderful organization I have ever seen. Nothing is ever late in arriving, and there is no scarcity, but no waste. Every man has his job, does it, and never knocks the other fellow. The Brigade Commander, with whom I spent three days, is a lord—has the V. C., D. S. O., and numerous other initials after his name—yet if some of our people should see him dawdling over his dinner and sipping his port afterward, wearing a monocle the while, they might think he was a typical silly-ass stage Englishman; but believe me, folks, that chap is the real thing in the soldier game. I unhesitatingly admit that during the first few days of my stay in the trenches, I was scared green, and any man who says he isn't is a liar. No trench or dug-out seemed deep enough to suit me during those first few days, and when on the second day the Boche dropped a 'minnie' that must have been as large as the dome on the capitol at Washington plunk into the trench about thirty yards from me, and the dirt and stones began to rattle down like hail on my tin hat, I was quite ready to call off the war right there and return to the Armory warfare of Thursday-night drills, where the most dangerous thing is one of Tom Anderson's delayed-action fuse sub-calibre cartridges down in the range. However, one has to get used to such things, and in a few days, I was walking about the trenches, standing up to the full height of my 68 inches.

A little bit of everything happened while I was there. I now know what it is to go 'over the top,' stumble over a dead Boche, and fall into a mass of barbed wire. I have been sniped at, a target for machine-guns, and helped dig up one poor fellow from a shell-crater whose entire body below his chest was blown away. One of my prize possessions is a Boche bullet that knocked my stick from my hand, but did no further damage. The infernal thing is dum-dumed too, as I shall show you if I have the good fortune ever to be back. A new trench-coat that I bought in Paris just a few days before was so badly eaten up by the liquid from a gas-shell that exploded near me that I had to throw the thing away. They also pulled off a raid while I was in the line and brought back three Huns. Only one man of the raiding party was hurt. They brought him back, as they always do, but I fear the poor chap has died, as he was shot through the stomach.

I know that all this seems like fiction, but every word of it is true, for one cannot exaggerate anything about this war. Thousands of similar things are happening to thousands of men up there every day, but no one thinks anything about it. It is quite as natural to them as is your daily routine at home to you, or anyone else. Of course, happening to me, some one you know, it may seem impossible, but unfortunately it is not. We have just such things ahead of us for our daily routine until this hellish war is over.

My work here is to be intensely interesting, and by all odds the most difficult I have ever attempted. The class consists of 116 officers, with a great preponderance of colonels and lieutenant-colonels. I am the only National Guard officer in my section, and as about only one in five of the previous class qualified, you can imagine what I have ahead of me. Unfortunately, there is a strong prejudice against N. G. officers, which makes it just that much harder for me, but the goal I have set for myself is to be among the first ten at the finish, prejudice or no prejudice, for that is the honor group, and Company I would never stand for a piker.

The town here is wonderfully interesting, one of the oldest in France and more closely associated with early Roman history than the French. When I was struggling through Caesar's 'Commentaries,' I was trying to read a lot about this place and its associations with his humorous scraps with the Gauls. God knows, I hope I make a better showing in my present studies than I did then, for I never could get Latin through my head.

DECOMPOSITION of refractory minerals containing alkali metal and aluminum is effected by a process patented (Can. 183,238) by W. H. Swenarton, as follows: Finely ground feldspar is intimately mixed with an equivalent of K_2CO_3 and fused at 800 to 1200° C. for about one hour. The mass is removed from the furnace, ground, and digested with approximately 10 volumes of water, and then filtered. The precipitate is boiled with concentrated H_2SO_4 or HCl, and neutralized with alkali to precipitate the Al_2O_3 and the SiO_2. The filtrate is boiled to precipitate the K or the surplus K may be removed by neutralizing with $Al_2(SO_4)_3$ or with potassium-alum until the solution is slightly acidified.

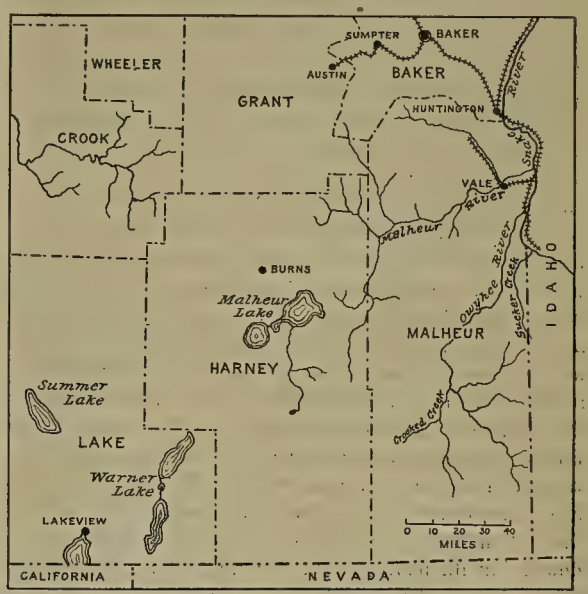
Nitrate Deposits of South-Eastern Oregon

By IRA A. WILLIAMS

The first announced discovery of nitrates in south-eastern Oregon was on Sucker creek, Malheur county, on the Snake river a few miles across the line in Idaho. Nitrate salts were recognized there in 1914, and also on Jump creek south of Homedale. The publicity given to this discovery led to a wide search for nitrates in all parts of the semi-arid portions of Oregon. Throughout the succeeding three and one-half years a large number of nitrate showings were found scattered from Deschutes county through all of the three largest counties of the State, Lake, Harney, and Malheur. Certain features are common to practically all the deposits so far examined in that region. One feature is that they are associated with the more acid types of volcanic rocks, namely, rhyolite, rhyolite tuff, and silicified rhyolite and tuff. Not a single verified instance is on record of the finding of nitrates in connection with the basaltic flows that cover enormous areas in this portion of Oregon. A second feature is that the prevailing nitrate compounds recognized in these deposits are both sodium or Chile saltpetre ($NaNO_3$), and potassium nitrate (KNO_3) or common saltpetre, and occasionally small amounts of calcium nitrate ($Ca(NO_3)_2$), or of the similar compound of magnesium. Rarely do these salts exist alone, or even constitute the main proportion of a deposit; they are accompanied everywhere by one or more of the following substances: sulphates of sodium (Na_2SO_4), of magnesium ($MgSO_4$), and less frequently sulphates of aluminum and of lime. Common alum is sometimes present; chloride of sodium and of potassium; carbonates of sodium, and lesser amounts of magnesium and calcium carbonates. The salts are frequently stained with iron compounds. A third point of resemblance among the various occurrences is the position in which they are found. With rare exceptions, all are found in the walls, roofs, or floors either of open caverns, or in partly protected crevices or other recesses in the rocks, as incrustations or coatings on the surface, as disseminated crystals or crystalline masses in the dust, rock-scale, or talus, and organic matter, which compose the floor of the caves, and in the pores, cells, and vesicles of the rock adjacent to such openings. In the majority of instances there is evidence that animals, birds, or reptiles either have inhabited, or at the present time make use of, the chambers in or near which the nitrate salts are found.

The following localities were visited in the course of my work during two seasons:

Sucker Creek. Following the discovery of nitrates here in 1914, G. R. Mansfield of the U. S. Geological Survey visited the locality and has described the deposits in Bulletin 620-B. Much of the course of Sucker creek is cut in the Eocene lake-beds, which consist generally of sandy clays, volcanic tuffs, some conglomerates, and sandstones. The lake-beds are interbedded with and overlie rhyolitic lavas, through which Sucker creek has trenched a deep rugged canyon. It is in and associated with the rhyolite that the nitrates occur. In texture, the rhyolite is dense to vesicular, and the rhyolitic tuffs vary from compact to ashy and porous. The nitrates and other soluble salts appear more frequently in the open-textured varieties. A notable feature of both tuff and lava is the generally constant presence of secondary



SOUTH-EASTERN OREGON, IN WHICH ARE NITRATE DEPOSITS

silica in the pores and cells, and in the lining of the crevices. Much of the silica is opal and agate and obviously marks a period of hydrothermal action. In 1915 and 1916 an organization known as the American Nitrate Co. undertook to prospect and exploit a group of claims on Sage and Sucker creeks. Experimental leaching vats and an evaporating plant were constructed, and an effort was made to determine the quantity and distribution of the salts, and the feasibility of extracting and refining them on a commercial scale. My samples, taken in 1916 from various openings made by this company, were tested qualitatively in the field by E. G. Stowell of the U. S. Bureau of Mines. The tests demonstrated the existence of a mixture of soluble salts in every exposure, sometimes, however, being scarcely a trace. Chlorides and sulphates were uniformly present, the bases being sodium, potassium, calcium, magnesium, and aluminum. Some of the best showings were in the outcropping slopes

of a bed of ashy shale-clay to the north of Sage creek. It was here that the leaching plant was installed with the intention of working the outer 12 to 18 inches of the sandy clays for the nitrate salts. The results of the quantitative analysis of an average surface sample from this slope is as follows:

	%		%
SO_3	0.40	Potash (K_2O)	0.30
Chlorine	0.52	Soda (Na_2O)	1.00
Calcium	0.41	N_2O_5	0.69

The above constituents represent a combined total of soluble salts of somewhat more than 3% of the sample. Operations were continued by this company for some months, and finally abandoned. In all instances, where tunnels were driven into the tuff or rhyolite, starting at points where nitrates were exposed at the surface, the quantity was found to diminish rapidly to a trace or to absolute disappearance.

Owyhee River. In northern Malheur county, deposits of nitrate salts have been found at a number of points in the canyon of the Owyhee river both above and below the Watson post-office. The salts appear at the base of a vertical cliff of rhyolite and rhyolitic tuff probably 100 ft. high, facing north. The salts are found at the head of a talus, 130 ft. above the river. The tuff is porous, pebbly, in places open-textured, and even soft and friable. For a distance of 100 to 150 ft. along the face, and for several feet above the upper border of the talus, every protected re-entrant, and particularly the walls of a series of under-cut caverns, are heavily coated with a whitish efflorescence of what proved to be chiefly sodium nitrate. The salts are also mixed with the dirt and organic matter in the floors of the caverns, and a series of open-cuts in the talus proves, according to J. H. Matthews, that the nitrate is quite generally distributed throughout a large body of material. The penetration of the salts into the rock of the cliff has not yet been ascertained. The favorable position of the rock face, at the base of which the nitrate occurs, accounts no doubt for its having been a rendezvous for stock for many years and for wild animals and birds indefinitely. The surface showings of soluble salts, which are prevailingly nitrate, are the most conspicuous and abundant of any prospect I have seen in south-eastern Oregon. This property is known as the Hercules claim. Similar exposures at intervals farther up the river are reported. Five or six miles down the Owyhee from Watson is the Stickney group of claims along the west side of the river. Here, as before, the salts appear at the foot of the cliffs at the upper limit of the talus in both rhyolite and rhyolitic tuff. It is notable, however, that, instead of nitrates being universally present, some exposures are practically free from these compounds. For example, at the slightly under-cut base of a cliff of hard jointed rhyolite, with a southern exposure, the loose broken detritus that has scaled from the rock is in places bound together by intercrystallization of a fibrous mass mainly consisting of magnesium sulphate (epsom salt). Sulphates predominate to the practical exclusion of nitrates. Above the border of the talus, for a few feet, in the exposed and scaling rock, only the less soluble calcium sulphate (selenite or gypsum) is present. No organic matter is in evidence in this exposure. One-half mile to the southward the salts occur in the dirt and talus for a few hundred feet along the under-cut base of a sharp cliff or inclined beds of buff, pebbly, volcanic tuff. Here, again, sulphates predominate, the main compound being sodium sulphate (glauber salt), with only a minor proportion of other non-nitrogenous salts. No systematic prospecting has been done. Thirteen miles west of Vale are claims held by Matthews Bros. of Twin Falls, Idaho. The lake-beds are deeply dissected by side gulches and water-courses leading into the valley of Malheur river. The showing of soluble salts appears at intervals along the outcropping edge of a 5-ft. bed of pebbly tuff or fine-grained conglomerate. The stratum rests upon a well-cemented boulder-conglomerate, and is covered by tuff and possibly by inter-bedded lava in places. The salts are on the western exposures and in under-cut portions of the bed. A sample of the richest material gave distinct reactions for sulphates, chlorides, or nitrates. The bases recognized were sodium, calcium, and magnesium, and less decisively, potassium.

Duncan Bridge. Samples containing supposed nitrates from near Duncan bridge on the Owyhee, Malheur county, were submitted to the Bureau in 1916 by W. P. Keady of Portland. Chemical analyses of four samples gave the following results:

Sample 1

	%
Insoluble (largely silica and alumina)	14.7
Sodium bicarbonate ($NaHCO_3$)	20.34
Sodium sulphate (Na_2SO_4)	18.73
Sodium carbonate (Na_2CO_3)	2.54
Potassium nitrate (KNO_3)	0.45
Sodium chloride (NaCl)	40.24

Sample 2

	%
Insoluble	16.50
Sodium bicarbonate	18.54
Sodium sulphate	20.20
Sodium carbonate	1.50
Sodium chloride	40.80
Potassium nitrate	1.34

Sample 3

	%
Insoluble	25.60
Sodium chloride	44.87
Sodium sulphate	27.84
Potassium nitrate	0.97

Sample 4

	%
Insoluble	18.97
Sodium sulphate	34.76
Sodium chloride	43.16
Potassium nitrate	1.43

In the vicinity of Duncan bridge about 300 ft. of the lake-beds are overlain by 15 to 25 ft. of more recent basalt, separated from the former by 15 ft. of gravel and sand. Two miles below the bridge, the uneven surface of the underlying silicified rhyolite appears and rises down-stream, so that the sedimentary lake-beds are shortly displaced entirely by the lava. The canyon of Crooked creek is a gash cut through the lake-beds into the rhyolite. Small showings of nitrates are found in a few protected places in the north wall of this canyon just above its embouchure into the Owyhee. The salts here are in the cells and vesicles of the lava, and in places as a coating in cracks, and in the rock detritus of the floors of under-cut recesses at the bases of cliffs that face

south. The showings here are quite inconspicuous, and to the taste there is present always a large proportion of common salt (NaCl) and of ordinary sodium-bicarbonate. Chemical tests by G. E. Stowell of a series of samples of both salts and of the parent rock demonstrated the presence of both potash and soda nitrates in three out of five. Epsom and glauber salts, soda, common salt, and some alum were found in the various samples.

McDermott. L. R. Hagler submitted samples of soluble salts said to have come from a locality close to the Oregon-Nevada line. Tests showed that they contained both potassium and sodium nitrate. A visit to this locality proved that the sample came from altered silicified rhyolite, a great thickness of which appears to occupy a considerable area eastward from McDermott. This rock, as exposed along Rock creek, one of the head-feeders of the north fork of Quinn river, weathers in places into conspicuous domes, pillars, and jagged cavernous crags projecting from the canyon wall. It is in one of these, 200 ft. above the stream in the east wall of the gorge of Rock creek, that the nitrates occur. The group of crags in which the salts are found is a contorted cavernous and scoriaceous rhyolite, obviously inhabited by both animal and bird life, as attested by the presence of guano. The salts in small quantity coat the sides and top, here and there fill in the seams, and also permeate the soils in the floor of numerous small caverns.

Rawhide Gulch. The American Nitrate Co., with holdings both in Sucker creek, Malheur county, and at Wagontire mountain, Lake county, prospected also in the gulch of Rawhide creek, which is cut through rather flat-lying acid lavas and tuffs, and is rarely more than 75 to 150 ft. deep. For several miles there are indications of nitrates along a nearly continuous rim of fairly hard, pink, rhyolitic tuff-breccia. As elsewhere, the salts are in crevices, and in the linings and floors of caves, undercut recesses, and other protected re-entrants in the faces of ledges and cliffs. They are found also to an almost unexpected extent within the pores of the rock itself, in proximity to places where coatings appear. The salts are potassium and sodium nitrates, accompanied always by sodium bicarbonate and common salt, and occasionally by alum. In the opening where nitrates are found there is almost universal evidence of the presence of animal and bird-life. The quantitative analysis of the salts from a sample of the rock in Rawhide gulch, broken from a freshly blasted face, where surface showings are favorable, gave the following results:

	%		%
Nitrogen pentoxide (N_2O_5)	0.16	Lime (CaO)	0.27
Potash (K_2O)	0.12	Chlorine	0.88
Alumina (Al_2O_3)	0.21	Sulphur trioxide (SO_3)	0.24

Similar nitrate showings were prospected by this company in Buzzard gulch 15 to 18 miles north-east from Rawhide. The salts are found here for a few miles mostly in a soft, rhyolitic, tuff-breccia. On account of variations in its character, cavernous masses of the tuff protrude from the canyon wall in places, and these seem to have been favorable positions for the soluble salts to accumulate. They are not limited to these positions, however. Exposed faces of the tuff exhibit a sort of case-hardening, by which a relatively hard outer shell of not more than an inch in thickness is produced. Within this resistant and obviously less pervious shell, the clean crystalline soluble salts were frequently observed some distance from surface showings, as though their accumulation were not only favored but their existence protected after being once formed. Hard, dense, columnar basalt appears at intervals beneath the tuffs in the walls of the canyon, which in this locality is 150 to 200 ft. deep. Qualitative tests indicate the presence of potassium nitrate, associated always with lesser amounts of chlorides, sulphates, and some carbonates. So far as can be learned, prospecting or exploitation has been abandoned in both of the last mentioned localities.

Lake County. In the Warner Lake region, the front of the great fault-scarp, which borders the Warner valley on the east, rises precipitously for the most part to a height of from 1600 to 1800 ft. above the level of the lakes. Along this front a series of relatively flat-lying beds of volcanic lava are exposed, including a considerable thickness of inter-bedded tuffs and tuff-breccia. Near the top or rim of this great wall the lavas generally consist of basalt, while underneath are many less basic varieties, probably andesites, or even rhyolites. Nitrate claims have been filed upon ground extending along the base of these cliffs on the east side of the Warner valley for a distance of 12 miles. The showings so far found came from out-cropping pink and gray beds, probably andesitic tuff, from 500 to 700 ft. above the level of the lakes. In places these beds consist of reddish scoriaceous masses, and it is in these more open-textured portions that the chief traces of nitrates are found. Samples sent from this locality by O. B. Hardy of Lakeview contained nitrates in notable amounts. I made a careful examination of these tuff-beds for some distance along the outcrop within the limits of the filings, and samples were taken from several of the most likely points. Qualitative chemical tests made by G. E. Stowell revealed scarcely a trace of nitrates and but little more of common salt and soda.

Wagontire Mountain District. Wagontire mountain is a series of dissected ridges radiating from a flattened conical elevation that has the appearance of having been uplifted since the later basaltic lavas spread over the region. The bulk of the Wagontire mountain mass is of acid varieties of lava—rhyolite, rhyolitic tuff, and breccias. The Wagontire group of hills is in northeastern Lake county, and extends eastward into contiguous portions of Harney county. The highest point rises 6375 ft. above the sea. Sheep mountain, lying to the north, appears to be a spur connected with the main elevation, and is similarly composed of acid tuffs and cellular rhyolite, impregnated in part with silica. The summit of Sheep mountain is approximately 5650 ft. above tide. Nitrates have been found in many places on Wagontire mountain and its environs. Streams have cut deep radiating gorges into the east, south, and west slopes, and in the sides of these gorges are almost continuous exposures of the rocks of which the mountain mass is composed. More resistant lavas form rim-rocks

extending for many miles. Where protected along the faces of these cliffs, in innumerable recesses at their bases, where they have been under-cut, or where they rest upon the tuffs or less resistant lavas, nitrates and associated salts appear on the walls of the rocks, as a lining of caverns, in crevices, in the talus, and in the organic matter and dirt accumulated on the floors of caves, and frequently to an unanticipated extent, permeating the pores and vesicles of the rock itself. Almost invariably there is evidence of the occupancy of these openings in the rocks by different forms of animal and bird-life that inhabit the region today. Along the gorge of Lost creek, which flows to the north-west, and in others that lead down the west and south-west slopes of Wagontire mountain, the nitrate is present in a great many exposures, and most pronouncedly on the north wall of these gorges, and in exposures which face in a general southerly direction.

The American Nitrate Co. did a considerable amount of prospecting for nitrates on Wagontire mountain in 1916. Samples taken from many places on the ground by myself and G. E. Stowell, showed the presence of nitrates, associated usually with sodium bicarbonate, sodium chloride, and often with calcium and sodium sulphate, and lesser amounts of alum. On some exposures the ordinary saltpetre was the more plentiful, while in others Chile saltpetre ($NaNO_3$) prevailed. In no sample, however, representing a large body of the rock, was the percentage of soluble salts more than a fraction of one per cent. The response to tests for nitrate on materials from below the soil-line at the top of the talus was always negative. Positive tests were obtained on the cliff as high as 25 ft. above that line, and to a varying distance inward from the face of the rock where drifts were cut, the amount invariably decreasing, with added depth. There are several facts that should be called to mind in connection with the manner of occurrence, association, and possible origin of these salts. Both potash and soda nitre are found, the latter being somewhat more common than the former. They are usually accompanied by other soluble compounds, such as carbonates of sodium and lime, chlorides of potassium and sodium, sulphates of potassium, sodium, magnesium, calcium, and also aluminum as an an alum. On the other hand, one or more of the series of soluble salts enumerated occur in many places where nitrates are absent, in positions apparently identical with those that furnish strong nitrate reactions. It is also true that many obviously favorable points in a given region will be examined for nitrates in which neither they nor any other soluble salts are found. Thus a set of conditions is observed that is nearly uniform where nitrates have been found in Oregon. So far as known, nitrate salts are formed in Nature through the action of various species of bacteria upon animal refuse, and are normally produced in soils in the process of decomposition of dead plant life or humus. The alteration of the mineral constituents of the soil or of an alkali-bearing rock provides the needed alkalies for the formation of the inorganic salts or nitrogen. The other associated salts enumerated, result likewise from the alteration and decay of rocks, but do not require the intervention of organic processes for their production. The nitrates are extremely soluble, as are the chlorides, and most of the equivalent sulphate and carbonate salts of the alkalies and alkaline earths. As a result, all of these substances are susceptible to solution wherever water can reach them, and they accumulate only in positions where concentrated by evaporation. Natural deposits of large size, therefore, are rare, and are found only in arid or semi-arid regions.

Chemical examination of the circulating waters of the earth, particularly the water from deep wells and from springs, proves the universal presence in them of dissolved mineral salts. The sulphates, chlorides, and carbonates are most common, but it is notable that, in all waters coming from any depth nitrates are conspicuously absent. Usually, though not always, waters of higher temperature carry a larger proportion of these salts, which are dissolved from the rocks through which the waters have moved, and are produced either directly by the action of the dissolved gases in the water or they are removed from positions where they have previously been deposited by waters temporarily unable longer to contain them. The dissolved salts come originally from the decomposition of the rocks. Streams of all sizes gnaw their channels into the surface of the earth; in so doing the movement of the water in each successive water-bearing bed is intercepted. Different strata hold varying amounts of water, depending upon their character, position, and upon the rainfall of the region, so that the amount issuing from dissected strata varies from springs of great volume to the tiniest seepage. In arid regions, evaporation is excessively rapid. South-eastern Oregon is a region of low precipitation, where the loss by evaporation is correspondingly great.

In reviewing the localities where the nitrates have been found, it will be seen that typically they appear at the bases of ledges or cliffs where they cannot be seen to have apparent connection with moving water. The fact that these soluble salts are crystallized upon the wall-rocks, and to some extent within the pores of the rock itself, proves that enough moisture has been present to bring about such distribution, but that it has been lost by evaporation, leaving the salts where we find them. Other salts usually are associated with the nitrates, and these are the very salts that are always present in circulating underground waters. They are deposited wherever these waters reach the surface and evaporate. This leads to the inference that where these diverse types of soluble salts are found associated the moisture that deposited one type also deposited the other; but since, so far as we know, the method of origin of the two is widely different, the sources from which they were derived by the water must likewise be widely separated. The association of the nitrates in most of the deposits in south-eastern Oregon with one or more of the groups of other soluble salts is thus fortuitous, not genetic. This conclusion is strengthened by repeated observations of sul-

phates, chlorides, carbonates, to the exclusion of the nitrates, in positions similar in every way to those where nitrates exist either almost alone, or accompanied by the other salts. Many favorable places also show no salts of any kind. The bases and outer walls of cliffs are favorable places for the escape of water into the air. If the particular stratum happens to be dry, there will be no water to escape, hence no deposition of salts. If the water that escapes carries no matter in solution, no salts will be deposited. Finally, if the point of escape is so exposed that salts once left are again washed away there will be no encrusted salts. Hence one exposure may be barren, and another, apparently of similar environment, may be charged with soluble salts. It is the presence of representatives of the group of soluble salts that characterize circulating underground waters everywhere, and particularly in regions of volcanic and related rocks, which is the key to the origin of the Oregon deposits and to the agent that has effected their accumulation.

For the origin of the nitrates we must look to one or both of these sources. The soils of the region where nitrates have been found, are generally thin or even absent over considerable areas. The chief form of vegetation is a sparse growth of sage-brush, while a low annual precipitation makes conditions less favorable to nitrification than in regions of moist climate. The other source of organic matter in a region such as this, is the accumulated refuse of animal and plant-life that exists in many of the caves and protected recesses where the nitrates are found. It is by the artificial nitrification of masses of animal refuse that some commercial nitrates are produced, and it is recognized that, in other parts of the world, cave nitrates have been formed by this process. In the presence of an adequate amount of moisture, there is reason to believe that nitrification and the production of nitrates, has taken place in many of the cave-earths of south-eastern Oregon, and that it is by this method that most if not all of those yet discovered have been produced. Of the various exposures showing nitrates in 10 separate localities in south-eastern Oregon, the majority are closely related to such cave accumulations. Caverns containing an abundance of organic refuse in which no nitrates appear are not uncommon. Also occasional showings of nitrates occur in places where organic matter is now not in evidence. In dry caverns nitrification does not proceed, in extremely wet ones, the salts are washed away; in other places caves may be abandoned by their inhabitants, or the salts may travel by capillarity some distance in a porous rock and appear where there is now no obvious relationship between them and their organic source. Where the nitrates are found in association with other soluble salts, it simply has so happened that their position coincides with the place where the underground waters, with their dissolved contents, have reached the surface in some abundance and have deposited their load of salts by evaporation.

With the above facts of origin in mind, it should now be possible to draw some serviceable inference as to the probable extent of such deposits. It has been shown that the origin of the nitrate compounds is without question at the surface. The question will at once arise, if these are but concentrations at the surface, will they not be constantly replenished, and, if removed, be replaced by a never-failing supply? The answer is that, in places, there is some evidence that salts, other than nitrates, are now being deposited, but at a much slower rate than formerly. In any case, the rate of accumulation could not be expected to furnish a recurrent supply for commercial operations.

BROMINE is derived from bittern left after extracting salt from the brine pumped from deep wells at Mount Pleasant, Midland, Saginaw, St. Charles, and Bay City in Michigan; at Pomeroy in Ohio; and at Mason, Hartford, and Malden in West Virginia, according to R. W. Stone of the U. S. Geological Survey. The element bromine does not occur in native form, but is derived in large quantities from natural brines. It exists in all sea water and in most mineral water and salt springs, and has been found in giant kelp (sea-weed). Bromine is at ordinary temperature a volatile heavy mobile liquid of a reddish-brown color, giving off reddish-brown vapor. The vapor when inhaled dilute resembles chlorine in smell and in attacking the throat and nose, but in addition it has a very harmful effect on the eyes. The liquid is very poisonous and produces burns on the skin. Bromine is used in many chemical reactions as an oxidizer instead of chlorine, also in dissolving gold and separating it from platinum and silver, and in manufacturing disinfectants, bromine salts, and aniline colors. Perhaps the best known and most widely used bromine salts are bromide of silver, used in photography, and potassium bromide, used in medicine where it is desirable to depress the nervous system. Because of its harmful effect on the eyes, nose, and throat, bromine is now used in large quantity for grim purposes of warfare. To increase the domestic supply the Government has arranged for the drilling of additional salt wells in Michigan, which were expected to be producing bromine-bearing brine by July 1918. The output of bromine in 1917 was 895,499 lb., worth 55c. per lb., a gain of 23% in quantity over 1916, but a drop of 76c. in the price.

ON first melting copper cathodes the bath takes up sulphur from traces of the electrolyte left on the sheets, and from the fuel. This sulphur is totally eliminated during the period of oxidation by the reaction of Cu_2S with Cu_2O. When the Cu_2O has been sufficiently reduced by poling, this reaction is reversed and sulphur is absorbed, some from the hot gases, but more from the cover of fuel on the bath. A coke cover gave 0.0024% S in the final product, and a charcoal cover only 0.0011%. The lower sulphur also entailed a corresponding reduction in oxygen from 0.045 to 0.021% to give the proper pitch. The data were obtained from samples taken at intervals during the various stages in the routine operation at the Raritan Copper Works, Perth Amboy, New Jersey.—S. Skowronski, in Bull. A. I. M. E.

Concentrates

PEAT is used as a fertilizer and in compounding stock feed, as well as for fuel.

THE CREEP OR SLIP of belts is largely responsible for their wear. To lessen this wear pulleys should be as smooth as possible.

SPUN GLASS woven into cloth is a light diffuser, a non-conductor of electricity, a good insulator, and acts well in the filtration of acids.

WHEN WIRE-ROPE winds upon itself on a drum there is a crushing action on the rope, and where possible this condition should be avoided.

FILTER-PAPERS are made under several classifications. For qualitative work there are four kinds; for single-acid wash, two; and for double-acid wash, four.

TUNGSTEN MINERALS—ferberite, hübnerite, scheelite, and wolframite—were originally formed during certain phases of the consolidation of granitic magmas.

THE LENGTH of the flame in coal-dust firing is an indication of efficiency in combustion. If the flame is not more than five or six feet long, good work is being done.

MICA-SCHIST is now used as a furnace-lining, blocks being cut to the desired shape. In 1917 there was 39,975 tons used for this purpose. The price was $2.15 per ton.

MOVING PICTURES are now used to show, by means of photo-micrographs, the gradual changes in the structure of a metal when it is subjected to repeated bending stresses.

PLATINUM finds another use as a 'bridge' between the two leads in an electric detonator. This connection is in the guncotton or mercury fulminate, which is loose in the detonator, lying just above the packed fulminate.

COPPER CONCENTRATE, 50% grade, weighs 157 lb. per cubic foot; that of 15% grade, 128 lb.; and 65% ore, 188 lb., as packed for shipment, according to the U. S. Bureau of Standards. Crude oil weighs 51 lb. and sulphur ore 50 lb. per foot.

SAND-FILLING of stopes in the Simmer & Jack mine on the Rand cost 1.685 pence (3.370 cents) per ton of ore milled, and 6.074 pence (12.148 cents) per ton of sand lowered into the mine. This is based on the handling of 1,722,585 tons of sand in 7½ years.

CHROME is found disseminated through tachylyte near Webster, Jackson county, North Carolina, according to the 'Manufacturers Record'. A concentrating plant has been erected to treat this material. Tachylyte is a non-olivinaceous basalt, containing 45.73% SiO_2, 20.15% Al_2O_3, 12.46% Fe_2O_3, 8.67% CaO, 4.11% K_2O, and 5.74% Na_2O.

GOLD ABSORBED by copper plates varies in quantity. A 'primary' plate (directly under mortar-box) at one of the Rand Mines mills, after 20 years' service, yielded only 13.05 oz. of fine gold after being thoroughly scaled. Four others gave 24.05 oz. each, twelve gave 23.33 oz.; while five secondary plates (below the tube-mills) yielded 14.47 ounces.

GYPSUM is widely used as a fertilizer. Its action on the soil is indirect; it is not a food for plants, but it is supposed to act on the double silicate of magnesia and potash in the soil, freeing the magnesia and potash, so that they become available as plant food. Its use is believed to be beneficial only if these elements are present in the soil, and its application to some soils would therefore be of no advantage.

AMALGAMATION OF GOLD when ore is crushed through a coarse screen is difficult. At the Van Ryn mill on the Rand, corduroy was laid down in place of copper plates. This saved the gold as a rich concentrate. The corduroy was of the 'elephant' grade, 4 sq. ft. per stamp, or 0.49 sq. ft. per ton of ore per 24 hours. The tables had a grade of 12½%. Each ton yielded 0.272 lb. of concentrate, assaying 2.1% fine gold. This was ground in a barrel, with mercury, the amalgam retorted as usual.

THE CHINESE generally do not understand the relationship between paper currency and hard coins; they exchange the former for coins as soon as they can. If a gold standard were adopted by China, the gold would be hoarded. It is easier at present to maintain a silver standard system, and for China to unify the currency, according to a Japanese financier. Once the people were educated to the value of paper money, the gold standard could be introduced. Foreign paper money circulates in China, adding to the currency complications. It is estimated that it will take ten years to reform the Chinese currency problem, at an expenditure of Y500,000,000 ($250,000,000).

LUBRICATION of air-compressor cylinders is of greater importance than supposed. Disastrous explosions have resulted from using ordinary engine-oil in the air-cylinders. Only a pure mineral oil, with a flash-point as low as good lubricating qualities will permit, should be used. As little as possible of even the best oil should be used. Numerous cylinder-oils are compounded, and such oils are likely to produce a carbon that will stick the valves and collect on valve-faces and other parts of the cylinder and valve-chambers, resulting in a dangerous condition. Lubrication of the air-cylinder with soapsuds (preferably made of soft soap, about 1 part soap to 15 parts water) for a few hours each week (or less frequently if the load is light), instead of oil, will help materially in keeping the cylinder clean. To prevent rust from this a little oil may be fed in before shutting-down any time.

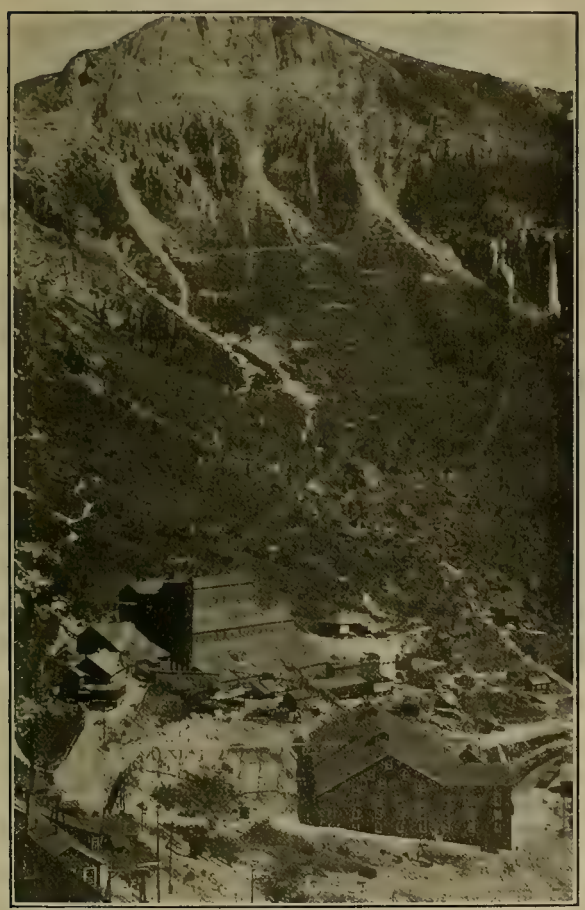
REVIEW OF MINING

SILVERTON, COLORADO

Mining in the San Juan Region.

Silverton.—The Sunnyside mill is producing 500 tons of lead concentrate per month.

The Mears & Wilfley flotation mill has three shifts working. As the season is short, the operators must work at full capacity. During the two months that remain of the present season they expect to ship over 200 tons of concentrate each month.



SMUGGLER-UNION MILL AND WATER-POWER—BRIDAL VEIL FALLS—TELLURIDE, COLORADO.

As the old Veta Madre mine has not been worked for a decade, the present operators have considerable trouble in timbering and cleaning out, but feel confident that they will be amply repaid.

Red Mountain.—This district is handicapped by a shortage of men, notwithstanding a wage of $5 per day. However, ore is being shipped in large quantities. Rich copper ore is also bringing good returns.

Some new orebodies have been opened in the Congress mine of the Kapegi Leasing Co. Regular shipments are made of 15% copper ore, about 30 tons per day.

Rico.—A large amount of development is being carried on in this district, and shipments of ore are encouraging. The Iron, Resolute, Expectation, and others report good results.

Telluride.—J. M. Belisle has found a market for oxidized iron ore from his claims near Ophir. The ore carries 50% iron, and is in demand for fluxing purposes.

The new mill of the Belmont Wagner Co. is concentrating 100 tons of ore daily. When the compressor is working this tonnage will be doubled. The hauling and erection of this large compressor involved difficulties, as the road to the Alta mines is steep, and of dirt construction. The contractors for hauling finally dismantled the large piece of machinery and hauled the separate parts.

The Carribeau Trust Co. suffered a loss of $2000 when the bunk-house, boarding-house, and assay-office were burned to the ground. The fire is supposed to have started in the assay-office from a defective gasoline heating system. The owners continue to ship ore.

Ouray.—Considerable prospecting and development is being carried on, although shipping is not heavy.

The Ouray Consolidated Mining & Reduction Co. has shipped small quantities of ore and concentrate from the Indiana, Grey Eagle, and Morning Star mines. At present the mill is concentrating Gem and Float copper-silver ores.

LEAD, SOUTH DAKOTA

New Work in the Black Hills.

Hill City.—The American Tin & Tungsten Co. has resumed work here under new management. The Cowboy mine is being unwatered. When this is done development will be continued. The concentrator is undergoing repair and additions, to enable it to handle 100 tons of ore in 24 hours. It is proposed to dress tin ore only. The Anna and Mohawk properties have been taken over under lease. To eliminate haulage by team, a motor-truck has been purchased, to carry ore from the mine to rail.

Since commencing work at the Blue Lead copper mine, 15 cars of ore have been shipped to the smelter. A new boiler and compressor are being added.

Custer.—The 100-ton concentrator at the Spokane lead-silver mine is in commission. Concentrate is hauled to Keystone, the nearest rail point, for shipment to smelter. In dressing the ore, Card sand and slime tables are employed. A satisfactory recovery is made.

A. E. Foye is erecting machinery at his mica mine east of Custer, and expects to produce both scrap and sheet material within a few weeks.

Pringle.—The Pringle Granite Co. has put in machinery, and will open a quarry within a mile from rail. The granite will be used for building and monumental purposes.

Keystone.—The Lithia mines are all active, and a large daily production is made. This could be further increased

but for the shortage of labor. Three concerns are shipping, the Standard Essence Co., the Rheinbold Met. Co., and A. T. Roos.

The Producers Mica Co. has a lease on the Last Chance mica deposit and is making shipments to Chicago.——Nichols brothers and Miners are also shipping mica from a property near Hayward.

Lead.—E. Manion, who has leased the Bismarck mine at Flatiron, is recovering considerable tungsten along with the gold ore. It is of good grade and only requires a little hand-sorting. The cyanide plant has been in continuous operation for several months, with satisfactory results.

Deadwood.—O. Seim is loading several cars of pyrite for shipment. This will be a trial to determine just what can be done with it. There is a large deposit and if the sulphur content is sufficient a large quantity can be shipped.

The Echo company has resumed work. Electric pumps have been installed and a lead-silver body will be thoroughly developed.

The Titanic is making arrangements to resume operations. Contracts have been let for driving a 1000-ft. tunnel.

Roubaix.—At the Jungle mine, one of the properties of the Custer Peake Copper Co., work continues. Shipments of ore have commenced to the smelter.

PLATTEVILLE, WISCONSIN

Principal Operations in All Parts of the Field.

Highland.—The New Jersey Zinc Co. raised miners' wages in this district 25c., making the total $4 per day. The No. 2 Clark mine is a remarkable producer of zinc ore.

Linden.—A scarcity of coal resulted in a shut-down of steam-driven plants in this district, and nearly all of the low-grade zinc ore producers are idle.

Mineral Point.—The Mineral Point Public Service Co., supplying electric power to the northern parts of this field, is reported to be in financial difficulties, and will be taken over by the Inter-State Light & Power Co. of Galena, Illinois.

The Mineral Point Zinc Co. is making shipments of 66% sulphuric acid at the rate of 6 to 10 tank-cars per week. Two separating-plants, dressing low-grade zinc ore, turn out from 700 to 800 tons of 60% concentrate, which is delivered to smelter at DePue, Illinois.

Dodgeville.—The Lucky-Five Mining Co. has completed plans for the construction of a new 100-ton mining plant to replace the one destroyed by fire several months ago.

Mifflin.—This district holds second place among producers in the field. The Coker and Yewdall mines are the largest.——The Peni mine has been abandoned and the surface equipment sold.——Extensive development is being done by the Vinegar Hill Zinc Co. on the Rundell lands. A new 200-ton mill is in course of construction.

Platteville.—There are three producers in this district. No shipments have been made recently, and it is stated reliably that there is held in bin over 3000 tons of choice zinc concentrate held for better markets.——Extensive drilling operations for the Wisconsin Zinc Co., on land north of the city, are being rewarded with fine strikes of zinc ore. H. C. George is geologist in charge.

Benton.—This district, leading the field for years in output of zinc ore, shows the stress of low markets and disrupted labor conditions. Shipments are now only 45 cars weekly, against 80 cars previously.——The Burr mine, for several years a consistent producer, has been abandoned and the mill removed to the Galena district.——New producers are the Iowa, Robson, and the Ida-Blende, the last recently equipped with a 100-ton mill. Several thousand tons of low-grade zinc ore is held in reserve at this centre.——The New Jersey Zinc Co. has developed a wonderful producer—the Hoskins—of zinc ore, shipments averaging 300 to 400 tons per week.——The Kittoe mine, under Vinegar Hill management, is said to be almost exhausted.

Shullsburg.—New producers are being developed in this district, and shipments of ore show gains. The Copeland mine of the Wisconsin Zinc Co. is shipping from 5 to 7 cars. Another good producer is the Oliver mine.

Hazel Green.—The only constant shipper from this district is the Kennedy mine, a steady producer for the past 25 years.——The Jefferson mine has had an uphill fight against water, lasting for nearly a year.——The Monmouth and McMillan mines, with two expensive rigs, are both idle.——The Cleveland and Lawrence mines are also closed. The field generally is dull.

Galena.—Two mines continue regular weekly shipments from this district—the Black-Jack of the New Jersey Zinc Co. and the North Unity of the Vinegar Hill Zinc Company.

GOLD HILL, OREGON

Shortage of Labor and Plant.—Copper, Manganese, and Chrome.

General operating conditions in the Gold Hill district since last season have been unfavorable, especially in mining, due to the scarcity of laborers and equipment. The 1000-bbl. capacity cement plant here, suspended last spring due to the inability to secure fuel-oil, has about exhausted its large stock of cement, and will be unable to resume. The State 200-ton limestone plant, built to supply Oregon farmers with fertilizer at cost, started late last fall and expected to be in operation early in the spring of 1918, has just been completed, due to a shortage of skilled mechanics and difficulty in procuring machinery. The Gold Hill Irrigation District has begun the construction of a 15-mile ditch and diverting works, three miles above Gold Hill on Rogue river. It is favored by having a number of local rock men who have been employed by several large saw-mills suspended for the season due to shortage of labor.

Jerome A. Hilbert, superintendent of the Blue Ledge copper mines, reports a monthly output of 300 tons of ore carrying over 12% metal. The wagon-haul charge to rail at Jacksonville is $10 per ton. Machinery consists of two air-compressors, Pelton water-wheel, two boilers, drills, and aerial tram. Development consists of 12,000 ft. Reserves are estimated as 250,000 tons.

D. E. Wells of Rogue River, formerly with the Engels Copper Mining Co. of California, who has been developing a gold mine 10 miles north-west of Gold Hill, has taken over the Neathammer manganese deposit in the same locality, under lease to M. S. Johnson, at Gold Hill.

D. B. Reynolds has been engaged to unwater the old Tyson chrome mine on Chrome hill, near Smith river, controlled by the American Exploration & Development Co. of Grants Pass. This property is said to be the oldest chrome mine in America, being worked in the early seventies, but abandoned in 1875. The main shaft is 85 ft. deep.

JEROME, ARIZONA

Recent Important Exploration in the Verde District.

The Grand Island Mining Co.'s shaft, recently enlarged to three compartments to a depth of 208 ft., is down three sets below the 200-ft. level. Good headway is being made in sinking. A diamond-drill hole from the surface, 250 ft. south-east of the shaft, is being run at an angle of 64° from the horizontal and will cut the shaft at about 550 ft. The bit was down 200 ft. on August 20. The formation is jasper, with occasional schist. This work is being done to prospect at depth the quartz and porphyry formation cut in a drift run west from the shaft on the 200-ft. level. The annual meeting is to be held September 11. A total of $117,971 in current assets on June 30 consisted of: supplies,

$1494; cash, $2126; United Verde Extension shares (2820 at purchase-price) $105,964; Liberty Bonds, $6000; accounts receivable, $2387. For the year ended June 30 development expense was as follows: 858 ft. of cross-cuts and drifts, $27,778; assessment work, $635; 90 ft. of shaft work, $4500; and 3097 ft. of diamond-drilling, $13,396; a total of $46,309.

Since July 27, when diamond-drilling started at the Calumet & Jerome, a total of 1060 ft. has been driven in three holes. No. 2 was driven horizontally from the long south-west cross-cut 340 ft. to the side-line of the property. No. 3 was also a flat hole, 270 ft. long. These two holes cut through a sheared schist-zone carrying some chalcopyrite and bornite. No. 1, a vertical hole, was bored in the sheared zone south-east of the shaft, on the 600-ft. level, and attained a depth of 450 ft. A new hole, No. 4, is being drilled near the winze on the 600-ft. level. This will be run vertically at an angle of 70°, to a depth of 500 ft. Its purpose is to explore at greater depth the sheared zone, which carried so much disseminated chalcopyrite. All the holes so far driven have been plugged on account of water.

The Jerome Verde will begin shipping ore from the Maintop orebody about mid-September. By that time everything will be ready for handling the ore through the Columbia shaft. A combination ore-bin, sorting platform, and waste-bin, having a capacity of 100 tons, is being constructed near the shaft, so that the ore may be hoisted and run out to the bins from a point 10 ft. below the collar. The raise from the 1100 to the 900-ft. level of the Maintop claim was finished last week, and a drift is now being driven to connect with the old 900-ft. drift, which leads to the Maintop orebody. On December 23, 1917, the contract between the United Verde Extension and Jerome Verde, which allowed the latter the use of the U. V. X. hoist, trams, etc., to handle the ore being extracted from the Maintop, expired; and it was necessary for the Jerome Verde to make other arrangements for extraction and transportation. A connection had already been started north from the Columbia shaft, thence around U. V. X. ground to the Maintop. This was finished a short time ago, so that it is now possible to tram entirely through Jerome Verde workings to the Columbia shaft, a distance of 3500 ft. Up to the time of the expiration of this agreement, 1600 tons of ore had been shipped to the smelter at Humboldt from the Maintop orebody. The last lot assayed 9.77% copper, 2.25 oz. silver, and 0.06 oz. gold. In order to reach the railroad at Clarkdale for transportation to Humboldt, the ore must be trammed by mules from the raise to the Columbia shaft, a distance of 3500 ft., hoisted to the surface, then hauled by wagon a distance of over five miles.

PORCUPINE, ONTARIO

Conditions at Porcupine, Kirkland Lake, and Boston Creek.

The supply of labor has lately been further depleted by the call for men to assist in harvesting the crops of western Canada. The situation on the goldfields, more especially Porcupine, is worse than ever; moreover, the efficiency of the labor that is obtainable is much below that prevailing before the War. The Hollinger Consolidated, despite present unfavorable conditions, continues production. It paid 1% dividend in June and another in August. The statements of output are not published now.

The McIntyre is also operating steadily, making a good profit. The annual report for the year ended June 30 is expected to show ore-reserves valued at $5,000,000, and a surplus of nearly $1,000,000. Owing to the greatly decreased demand for electric energy, due to the closing down of mines, the power-plant at Sandy Falls has been stopped.

Kirkland Lake.—The Lake Shore mine during June produced gold valued at $43,353, from 1761 tons of $24.61 ore. An initial dividend of 2½% has been paid. The July output will be slightly less, owing to mill repairs.

At the Kirkland Lake mine, good progress is being made in construction of the new mill. The shaft will soon reach the 300-ft. level, and will be continued to 500 feet.

According to cable advice, litigation in the British courts in connection with the Tough-Oakes mine appears to have resulted in favor of the London interest, Clement A. Foster having been awarded some money. Further proceedings have been taken in Canada, Henry Cecil having sued Mr. Foster and the original promoters for $150,000, as commission on the sale of shares.

Boston Creek.—Increased interest is being manifested in this district. Merchants are preparing to move to a new townsite near the railway station, on which work will shortly be begun. The Northern Ontario Light & Power Co. has entered the field, and is arranging to supply power to the Patricia mine. At this property the mill is treating 30 tons per day. The vein is from 2 to 4 ft. wide on the 200-ft. level, of high grade. About 94% extraction is made by amalgamation.

TEXAS

Condition in the Terlingua Quicksilver District.

Terlingua.—J. A. Udden, director of the Bureau of Economic Geology and Technology in the University of Texas, recently returned to Austin from a visit to the Terlingua quicksilver district, where he made an examination

PART OF TEXAS, SHOWING QUICKSILVER DISTRICTS.

of the producing mines and claims that are being developed. He said that there are four producers, namely, the Chisos Mining Co., Big Bend Mining Co., Marfa-Mariposa Mining Co., and the Ellis interests. The Chisos company is operating two furnaces, and is the largest producer. Two new groups of claims, known as the Wallingerger and Chisholm, owned by L. T. Millican of Denton, Texas, and associates, are being developed under direction of James La Faralle, formerly in charge of the Chisos mine. These claims adjoin the Chisos workings. Mr. Udden said that the road from Marathon, the nearest railroad station on the Southern Pacific, to Terlingua, 90 miles, is in fairly good condition. The Federal government has done some work on the road, as it is used by motor-trucks to supply the military patrol camps in that part of the Rio Grande border. The heat in the Terlingua district at this time of the year is intense, and little outside work can be done in the way of prospecting. Most of the buildings at Terlingua are of galvanized iron, which contributes to the intensity of the heat.

ARIZONA

Ajo.—The New Cornelia's new shaft to develop sulphide ore is down 250 ft. A station is being cut and a haulage-drift started.

The old Gunsight mine, east of this place, is said to be opening well to a depth of 170 ft. The ore carries lead and silver.

Seven miles east of Gunsight the 5-stamp mill of the Gunsight Gold & Tungsten Mining Co. is being overhauled. A 40 or 70-ton ball-mill is to be added.

Bisbee.—Shattuck Arizona has issued a statement covering the second quarter of 1918. The net profit was $116,883. There was 3957 ft. of development done. A large tonnage of 2 to 7% copper sulphide ore was found between the 800 and 900-ft. levels. Ore shipped amounted to 24,430 tons of copper and 529 tons of lead, yielding 2,489,099 lb. of copper, 272,294 lb. of lead, 46,361 oz. of silver, and 336 oz. of gold. The net operating cost per pound of copper was 13.789c. The lead concentrator was expected to start early in August. Dividends this year amount to $1.50 per share, equal to $525,000, making $6,912,500 to date.

Globe.—Copper production of the Old Dominion in July was 2,530,000 pounds.

Kingman.—The new leaching-plant of the Emerald Isle Copper Co. will be in operation by September. This plant is expected to produce 2000 lb. of refined copper and 1000 lb. of cement copper daily. A large tonnage of oxidized ore has been developed.

The Arizona Venture Mining Co., recently re-organized as the Waldron Mining Co., has commenced unwatering its 600-ft. shaft prior to commencing further development.

The Cactus Queen Copper Co. has purchased several old plants near Wickenburg, and will dismantle them to obtain the necessary machinery for its new plant.

The Washington-Arizona company at Mineral Park recently opened 18 in. of rich silver ore. The mill is now treating the low-grade ore, while the high grade is being shipped.

The Berkley mine has been unwatered. The old workings are being cleaned-out and the shaft deepened. This work is opening good ore.

Patagonia.—At the Flux mine, controlled by Bisbee people, the 200-ton mill has been re-modeled by adding tables and flotation machines to dress the lead-silver ore. A large tonnage of ore is said to be available.

Ray.—Copper production of Ray Consolidated in July was 7,300,000 lb. The report of this company for the second quarter of 1918 shows that the profit was $2,255,217, of which $1,182,884 was paid in dividends. The surplus was $1,072,333, compared with a deficit of $471,316 in the previous period. Costs totaled 16.468c. per lb. of copper, an increase of 0.740c. The mill dressed 881,800 tons of 1.643% ore, recovering 75.81%. The daily tonnage was a slight decrease, but recovery was 2.21% higher. Mining cost $1.677, including 5.60c. for coarse crushing, and 97.753c. for milling. The output was 21,963,414 lb. of copper.

Tucson.—Full ownership of the Imperial Copper Co., at Silver Bell, and the subsiduary properties of the Sasco smelter, has been acquired by the American Smelting & Refining Co., for the sum of $125,000, by the purchase of the remaining 35% interest in the estate of Frank Murphy. It is announced that operations will continue on an enlarged scale.

ARKANSAS

Batesville.—Manganese mining in this district continues to attract much attention. A number of properties have changed hands. Leases are difficult to arrange. Water is scarce.

CALIFORNIA

Eureka.—As chrome is shipped in fair quantities (3 carloads last week) from this place in Humboldt county, the Northwestern Pacific Railroad is providing better facilities for handling the ore. Vessels bringing chrome from Del Norte county and the Klamath river will be able to unload quickly into cars. In Del Norte, R. D. Adams of San Francisco, is operating most of the chrome deposits. Road building is part of the necessary work. Manganese is being mined in districts tributary to Fort Seward and Carlotta. Regular shipments are made. Shortage of miners and lack of good roads are drawbacks.

Fenner.—At the old Bonanza King mine, worked 40 years ago at this place near Goffs, San Bernardino county, a complete cyanide plant is being erected, to be ready early in September. There is reported to be 20,000 tons of 20-oz. silver ore on the dump, and a large quantity underground. The machinery includes a tube-mill, agitators, and Oliver filter. Sodium sulphide is to be used for precipitation.

St. Helena.—According to 'Magnesite in 1917,' just issued by the U. S. Geological Survey, Napa county contributed 19% (40,218 tons) of the total (211,663 tons) output of crude magnesite mined in the State last year. The principal producer was the White Rock mine in Pope valley, 20 miles east of St. Helena or Rutherford. Six vertical kilns were added, making eleven in all. Calcining is done by dumping in alternate layers of coke and ore. The company also uses two kilns at Rutherford and two at Oakland. The product is much in demand by basic open-hearth and electric steel furnaces on the Pacific Coast. We hope to publish a description of this mine at an early date.

San Francisco.—The Industrial Accident Commission has called public hearings to consider tentative quarry safety rules and tentative electrical-station safety orders. For some weeks past, committees of employers and employees have co-operated with the safety engineers of the Commission in preparing the tentative rules and orders. A. R. Wilson, vice-president and manager of the Granite Rock Co., is chairman of the quarries committee. J. P. Jollyman, engineer of electrical construction for the Pacific Gas & Electric Co. and representative of the National Electric Light Association, served as chairman of the electrical-station committee. During the 24 months of 1915 and 1916 there were 32 fatal, 60 permanent, and 2314 temporary injuries in the quarries of California. The total cost in compensation and medical fees was $176,034. Electricity caused 739 injuries in California during 1915 and 1916, divided as follows: fatal, 50; permanent, 13; and tem-

porary, 676. The sum of $153,566 represents the medical and compensation costs. The tentative quarry safety rules will be considered at two public hearings, the first on August 28 at 525 Market street, San Francisco, commencing at 10 a.m.; and the second on September 11 in the Union League building, Los Angeles, same time. The tentative electrical-station safety orders will be the subject of discussion at two public hearings, the first on September 12 in the Union League building, the second on the 25th at San Francisco, both at 10 a.m. The Industrial Accident Commission extends to citizens an invitation to attend these hearings.

Sutter Creek.—Twenty stamps are dropping at the Central Eureka mine. All ore at present comes from the 3500-ft., or lowest level. The vein worked successfully at 3350 ft. and slightly developed at 3400 ft. has been cut on the 3500-ft. level, showing indications of producing a large quantity of good milling ore. A. S. Howe is superintending this property, which is at present the only mine crushing ore between the Kennedy on the south and the Keystone mine on the north of it.

The Knight company, local foundry-men and builders of mining and milling machinery, recently added to their equipment by the purchase of the large planing-mill across the creek from its shops, and heretofore conducted by D. V. Ramazzotti.

Yreka.—Twenty 3-ton auto-trucks arrived at Seiad in Siskiyou county on August 24, to engage in hauling chrome from J. F. Reiddy's mine to the railroad at Hornbrook, a distance of 66 miles up the Klamath river. The trucks were 3½ days making the trip from Oakland. Forty-two men were in the party, in charge of E. H. Green. The trucks can make a round trip in a day between the chrome mines and the railroad, delivering a total of 60 tons.

COLORADO

Cripple Creek.—On the 1200-ft. level of the Modoc Consolidated's Last Dollar mine a good shoot was recently opened. Large shipments are being made, and larger ore-houses are under construction. A. H. Frankenburg is general manager.

Leadville.—The pyrite deposits of Leadville are described by H. S. Lee in a paper prepared for the Colorado meeting of the A. I. M. E. The distribution of pyrite in this district is general; but, eliminating the smaller bodies and those containing prohibitive quantities of zinc or lead, and considering only the larger deposits commercially valuable for their sulphur, the chief pyritic orebodies extend in a zone approximately 6000 ft. long and several hundred feet wide, from the Yak and Moyer, on the south; through Louisville, Greenback, Mahala, Adams, and Wolftone, on Carbonate hill, across Yankee hill, and into the Quadrilateral, Denver City, and Tip Top, on Fryer hill. The orebodies are replacement deposits in the limestone along some minor fracture, or contact metamorphic deposits along some porphyry dike or fault. Summarizing, Mr. Lee says that there are large deposits of pyrite in Leadville, containing a minimum of 43% sulphur, suitable for the manufacture of sulphuric acid. In these deposits there are enrichment zones containing gold, silver, and zinc; but the system of mining in use will permit selective methods whereby the portions more valuable for other metals may be stoped separately and shipped to the smelter while the pyrite is kept clean for acid use. The only material available now is run-of-mine ore suitable for crushing and roasting in 'fines' burners. The problem of lump ore, both as to suitability and preparation, will be worked out only when there is sufficient demand to warrant experiments. The returning of residue from a pyrite originally containing precious metals to the value of, say, $2 per ton, after calcination in the Middle West, for smelting in Colorado, is financially practicable.

IDAHO

Adair.—The Richmond M., M. & R. Co. made a profit of $28,751 in July. The output was about 1000 tons of copper-gold ore, valued at $37,444. Forty-five men are employed.

Mullan.—The Consolidated Interstate-Callahan Mining Co. has issued a report for the second period of 1918. The net profit was $168,916. A dividend of 50c. per share was paid on June 15, making the total $6,742,355, or $14.50 per share. Liberty Bonds worth $50,000 were purchased. The mill dressed 18,720 tons of ore, assaying 16.19% zinc, 4.40% lead, and 1.49 oz. silver. On June 1 the plant was closed for alterations, now complete. The flotation plant handled 20,082 tons of tailing. Shipments to smelter were as follows:

Class of product	Tons	Zinc, %	Lead, %
Zinc ore	915	45.75	....
Zinc concentrate	11,354	46.26	....
Lead ore	478	10.98	40.72
Lead concentrate	1,062	15.71	49.39
Zinc contents, pounds		11,781,177	
Lead content, pounds		1,438,396	

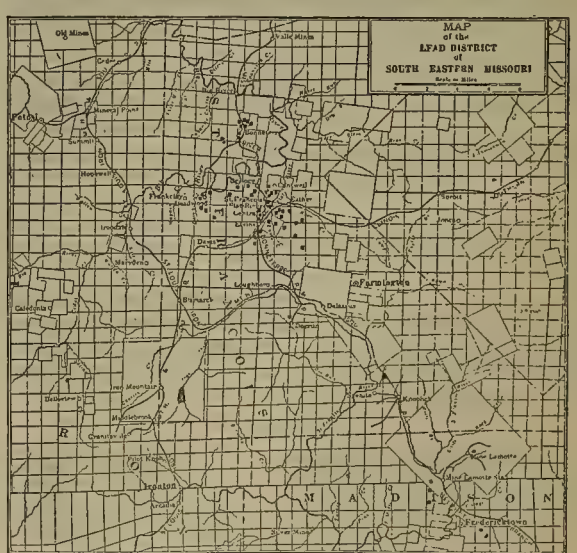
The recovery of zinc was 87.20%. The cost of mining was $5.006, and of milling $2.357 per ton. Mine development was satisfactory.

Wallace.—The Amazon-Manhattan mine in the Beaver Creek district has shipped 60 cars of lead-silver-zinc concentrate since the railway was restored. The ore was milled at the Ray-Jefferson plant, of 400-ton capacity. Reserves are said to be valued at over $2,000,000. The property adjoins the Con. Interstate-Callahan, and is owned by Jerome J. Day, Patrick Burke, Fred C. Robertson, Fred Miller, John M. Gleeson, and Joseph F. Morton.

Wallace.—The option on 1,100,000 shares of the Hypotheek company, held by J. K. George of New York at 15c. each, was given up last week. The company is to issue a statement at an early date. It has been in the limelight recently on account of the erratic price of the shares.

MISSOURI

Bonne Terre.—The National War Labor Board states that William H. Taft and Frank P. Walsh, sitting as arbitrators



on behalf of the Board in dispute between the management and employees of St. Joseph Lead Co. at its lead smelter in Herculaneum, have rendered an award which grants workers a general increase in wages, establishes a minimum wage, and provides a system of collective bargaining be-

tween employer and employees. Award is made retroactive to April 21. The arbitrators granted a wage increase on a sliding-scale in harmony with the principle recently applied by the Railroad Wage Commission giving to the $3 a day men a flat raise of $1, or 33⅓%, and graduating increase down to 10%, or 50 cents per day for those earning $5. For those earning more than $5 the increase was merely nominal.

Joplin.—Production of the region last week was 7839 tons of blende, 104 tons of calamine, and 1001 tons of lead. These averaged $56, $38, and $100 per ton, respectively. The total value was $543,103, of which Missouri yielded $105,265.

The Bankers Mining Co. is erecting a 250-ton mill northeast of Bell Center. Coal or gas may be used as fuel for boilers. I. P. Jones is in charge.

MONTANA

Butte.—The Butte & Superior Mining Co. reports a profit of $128,387 for the second quarter of 1918, against $327,982 in the first period. Costs rose from $9.7374 to $11.4451 per ton of ore, due to an accident at No. 1 shaft and other abnormal charges. The mill concentrated 114,716 tons of ore assaying 16.242% zinc and 6.154 oz. of silver, a decrease of 21,161 tons. The recovery was 90.925%, a drop of 4.537%. The yield was 33,881,677 lb. of zinc and 645,223 oz. of silver.

The Butte Copper & Zinc Co. reports as follows for the six months ended June 30, 1918:

Profit on zinc (22,700 tons shipped)	$132,106
Manganese settlements (28,900 tons shipped)	206,212
Amount due on 10,620 tons of ore shipped prior to June 30, all expenses paid	223,020
Total	$561,338
Deduct one-half for Anaconda company	280,669
Profit of Butte C. & Z. Co., plus interest, and less expense	269,338

Manganese shipments are now between 275 and 300 tons daily. Zinc production is being steadily lessened. After August it is hoped that the manganese can be sent to the ferro-manganese plant of the Anaconda company at Great Falls.

Kendall.—Barnes-King Development Co. paid dividend No. 6, of 10c. per share, on August 15. This amounted to $40,000, and makes $220,000 to date. The report for the second quarter of 1918 shows that receipts from gold, etc., totaled $182,036, plus $276,599 brought forward, making $458,635 available. All charges amounted to $244,818, including dividend of $40,000 and Liberty Bonds of $25,000. The quarter's profit was $58,679. Balance on June 30 was $181,523. The mines yielded as follows:

Mine	Tons	Value per ton	Profit
Kendall	765	$2.97	$925
North Moccasin	5580	9.25	15,282
Piegan-Gloster	4694	10.23	9,341
Shannon	8210	9.55	33,573

An option was taken on the Mount Pleasant claim, ¾-mile from the Shannon, the amount being $30,000, on terms. The property is considered encouraging, and yielded to previous owners 1200 tons of $30 ore. Costs of labor and supplies have advanced 50% in recent years.

NEVADA

Battle Mountain.—According to F. S. Schmidt, manager of the Copper Canyon Mining Co., operating in Copper canyon, 18 miles from Battle Mountain, the daily output is 30 tons of 8% ore. The increased freight and smelter rates and higher wages leaves the company little profit.

Ely.—Nevada Consolidated produced 6,400,000 lb. of copper in July. The report of this company for the second quarter of 1918 shows that a surplus of $852,578 remained after paying 75c. per share on June 30. Cost of producing 21,507,909 lb. of copper was 17.72c. per lb., compared with 18.07c. in the previous period, when 17,435,164 lb. was recovered. The mill concentrated 1,067,212 tons of 1.54% ore.

Goldfield.—Blair marsh, 25 miles from this place, is to be prospected for potash by J. W. Crane of Goldfield, who has a permit. A spring-pole drilling machine is to be used for holes less than 100 ft. deep, and a Keystone driller for over that depth.

Placer mining in Tule canyon, 35 miles south, is attracting attention lately. One property, worked by Hanus and Field, has a 12-hp. distillate hoist and 500-gal. pump. They are working in wash below bedrock.

Tonopah.—Production of the district in the third week of August was 9510 tons of ore valued at $161,670. Some July returns were as under:

Mine	Tons	Silver, oz.	Gold, oz.	Profit
Belmont	7,847	108,409	1,120	$58,635
Jim Butler	1,810	.....	....	30,622
Tonopah Mining	16,235	116,820	1,198	53,000

The West End is treating 4000 tons per month of its own ore, also ore from a number of lessees and small mines. On the Ohio vein, on the 500 and 800-ft. levels, high-grade ore is being extracted.

In the Divide district, a good progress is reported from the Divide, Dividend, Brougher, and Gold Zone. New machinery is being erected at the Divide. Over 5000 tons of ore is on the dump, and 50 tons daily is to be sent to Goldfield for treatment. Cyanidation has extracted 92% of the silver and gold. The proportion of these metals is 80 to 1. The latest development on the 370-ft. level shows $56 ore across 24 ft. The Dividend is cross-cutting at 300 ft. depth, and the Brougher at 177 feet.

NEW MEXICO

Santa Rita.—The Chino Copper Co. report for the second quarter of 1918 shows a profit of $1,916,513, dividends $869,980, and surplus $1,046,533, compared with $1,124,254, $1,304,970, and $180,716, respectively, in the previous quarter. Costs totaled 16.36c. per pound, an increase of 1.12c. Steam-shovels removed 940,057 cu. yd. of overburden. The concentrating plant dressed 901,500 tons of 1.5773% ore, recovering 66.93%. The total output of copper was 19,030,992 pounds. Chino produced 6,310,396 lb. of copper in July.

OKLAHOMA

Peoria.—The Nebo Lead & Zinc Co. is erecting a 200-ton mill, to be ready by October 1. The machinery includes a 100-hp. steam engine for the mill, 80-hp. engine for a compressor, crusher, four sets of rolls, three jigs, and five tables. Three shafts have opened ore from a depth of 130 to 176 ft. J. E. Turner is general manager.

Picher.—Production of the districts last week was 5464 tons of blende and 813 tons of lead, valued at $388,828.

North Century.—The Maxine Mining Co. is building a 500-ton mill near here. The mine has been thoroughly developed.

UTAH

Alta.—As the Salt Lake & Alta railroad is unable to supply enough cars, shipments of ore from this region are not moving as fast as they might. There is talk of putting tractors on the road.

Bingham.—Utah Copper Co.'s report for the second quarter of 1918 shows that the profit from operations was $5,483,813, more than double that of the first quarter. Dividends totaled $4,061,225. The surplus, including other income, was $2,432,152, almost 10 times that of the March period. Costs were 15.047c. per pound, compared with 15.484c., due to a larger tonnage. The mills concentrated 3,201,900 tons of 1.2535 ore, recovering 64.49%. This

quantity was 22% more than in the previous three months. The copper output amounted to 51,764,783 lb., a gain of 11,000,000 lb. Utah Copper produced 16,021,766 lb. in July.

Princeton.—The Canada Copper Corporation continues its extensive operations. Several miles of truck roads have been constructed to the mill-site; a 16,000-ft. sawmill is now at work. Some excavating has been done for the 2000-ton mill; a warehouse, machine-shop, 160-seat dining-room, and cottages have been built; and the head office is to be moved from the smelter at Greenwood to Princeton. Oscar Lachmund is general manager.

Sandon.—The American Boy silver-lead mine, on Reco mountain near here, has been bonded to C. F. Caldwell and others of Spokane for $100,000. The mine is opened by tunnels.

On the tenth level of the Silversmith mine there has been developed an orebody 100 ft. long, 100 ft. high, and 8 ft. wide, valued at $900,000. This mine has produced over $3,000,000 in lead, silver, and zinc.

Ontario

Boston Creek.—The Renaud claims, near the Miller-Independence gold mine, has been acquired by Robert Warrington for Detroit people. Several promising veins are said to have been opened. S. Renaud is in charge.

The Northern Ontario Light & Power Co. is arranging to supply current to the Boston Creek field.

Cobalt.—The Mining Corporation of Canada has its pumping plant ready for collecting the sand and slime from the bed of Cobalt Lake. The machinery consists of two 8-in. pumps, driven by 100 and 125-hp. motors. Their combined capacity is from 1000 to 1200 tons daily. The old residue is to be re-treated in the mill. The process will be, classifying, tube-milling, concentration, flotation of the sand, and cyaniding the slime. The material contains several ounces of silver per ton.

Silver produced by the Nipissing company in July was worth $304,694. This was extracted from 172 tons of high and 7058 tons of low-grade ores. The refinery shipped 842,870 oz., including custom metal.

The Buffalo Mines Co. is to reduce its capital from $750,000 to $500,000, by distributing $250,000. This is the second time that this has been done, the original capital being $1,000,000. Total dividends, including the proposed amortization distribution, will total $3,287,000.

The Kerr Lake mine produced 231,000 oz. of silver in July, well above the average for the year so far.

Porcupine.—The Davidson Gold Mines' report for 1917 shows that $86,138 was spent in development. Equipment is valued at $50,269. There was 3096 ft. of new work done, also 1181 ft. of diamond-drilling. Surface work disclosed good veins. On the 100-ft. level 11 ft. of $35 ore was opened in 1918. Reserves are 30,000 tons of $20, 10,000 tons of $15, and 100,000 tons of $7 ore, a total of $1,450,000. The new 60-ton mill is now in operation.

PHILIPPINE ISLANDS

The Philippine Dredging Co.'s results last year were as follows, compared with the previous period:

	1915-'16		1916-'17	
Dredge	Cubic yards	Gold, oz.	Cubic yards	Gold, oz.
No. 1	224,787	1,428	408,721	2,013
No. 2	835,986	11,426	717,089	8,340
No. 3	442,945	5,250	445,983	4,913
No. 4	524,170	3,126	626,460	2,559
	2,027,888	21,230	2,198,253	17,825

A dividend of 24c. per share was paid, and part of the debentures were paid off. This company has an interest in the Paracale dredging company, operating No. 1 and 3 boats under an arrangement.

PERSONAL

Note. The Editor invites members of the profession to send particulars of their work and appointments. The information is interesting to our readers.

Horace V. Winchell is at Salt Lake City.

Frank Walker, of Butte, is at the Whitcomb hotel.

J. K. Turner, of Goldfield, is at the St. Francis hotel.

A. G. Cadogan has gone to Los Acostos, in Pinar del Rio, Cuba.

James F. Kemp is taking part, as geologic expert, in the litigation at Bingham.

A. H. Jones, metallurgist for the Tonopah Belmont Development Co., is here.

S. M. Morse & Co., consulting engineers, have opened an office at Phoenix, Arizona.

Harlowe Hardinge has obtained a commission as Captain in the U. S. Radio Service.

W. W. Wishon is in Montana examining mines for Los Angeles and Montana clients.

James S. Douglas was in San Francisco this week, on his way from Arizona to Manitoba.

H. M. Strouss, mine superintendent for the Atolia Mining Co., at Atolia, has moved to Alameda.

S. F. Shaw has returned to Charcas, San Luis Potosi, Mexico, from San Antonio, Texas.

Arthur K. Adams is in the Engineer Officers Training Camp, at Camp Humphreys, Virginia.

Augustus D. Ledoux, not his brother **Albert R. Ledoux**, is chairman of the Chemical Alliance Committee.

Magnus Poulsen, engineer-in-chief to the Societe Belge Industrielle et Miniere du Katanga, is at Neuilly, France.

Sidney L. Shonts, of Wallace, Idaho, has been appointed a mining engineer in the Service of the U. S. Bureau of Mines.

C. A. Atkinson, general superintendent at the Cerro de Pasco smelter, sailed from Lima, Peru, for the United States on July 25.

Samuel W. Cohen, vice-president of the Bluestone Mining & Smelting Co., was in San Francisco recently, and has now returned to Montreal.

Forest Rutherford is making an examination of mines in Colorado and will attend the Colorado meeting of the American Institute of Mining Engineers.

W. E. Carpenter, mechanical engineer for the Anaconda Copper Mining Co., has been appointed to a similar position in the service of the Consolidated Arizona Mining Co., at Humboldt, Arizona.
